EGYPT.

A QUESTION was asked in the House of Commons on Thursday night as to the truth of a statement that, while the Viceroy of Egypt professes great anxiety to suppress the slave trade, a large batch of slaves had been lately sold publicly in Cairo. Mr. BOWEN replied, that inquiries into the matter had been directed, and that the Government was waiting for information from the Consul-General. There can be little doubt that when this information is furnished it will show that slaves have very recently been sold at Cairo. The instance is perhaps as good a one as could have been chosen to illustrate the present state of things in Egypt; the character of the reigning Sovereign, and the kind of progress that has been made, and is likely to be made in the country. It is quite true that while the Viceroy likes to take part in the demonstrations of European humanity, and is willing to send a vessel of war to cruise in the Red Sea on the look out for slavers, he also allows the old Mahometan institution of domestic slavery to be carried on within a few yards of his palace. He is a reforming Turk, but he is also a Turkish reformer. He could not change his country all at once if he wished it, and he would not wish it if he could. He has many generous impulses, and has a sort of nobility of ambition in his character. He enjoys not only the credit of making reforms, but the thought that he alone among Turkish princes has a sincere desire to stand not much below the level of a European prince. But he takes up even good things with the passionate and fitful eagerness of a child. Whatever he desires he wishes to have at once, and then to go on to something else. If he wants an opera, he must have it finished in six months; if he wants factories, he must have twenty set up in a moment. If he promotes an enterprise like the Suez Canal, he must so promote it as to fling into the abyss twenty millions sterling for which Egypt will never receive a penny by way of return. This is a turn of mind which in a reformer is equally Oriental and dangerous; but Europeans who criticize him should in justice remember how much this tendency has been stimulated by the absurd facility with which money was plied by Europeans at his command. If in business he is not very businesslike, it is also true that he has for years had to do with men who have neglected the first principles of business in dealing with him. He was never even invited to estimate his resources, but only to set gigantic schemes of borrowing. To prey upon him was the sole object of every one who could get access to him. Egypt has been the happy

And it must also be the tributary of a much to be. He has had to take his share in palace

persistent, and that his mode of managing things is often on the debatable land between good and evil.

In Egypt the VICEROY is everything. There is no aristocracy and no democracy. There is simply a population and a few Pashas, who can be made and unmade with a breath. The Viceroy has no one between himself and the public. He does all his work himself, and is one of the most industrious and toiling men alive, and allows no one to share his authority. In some ways this is a great advantage to the country. He is an able man and possessed of larger views than any of those who surround him; and he is capable of doing things which he would find very few Turks to emulate. That he should have accepted an arrangement last November by which he put all his income under the control of foreigners for the benefit of his creditors seemed to Europeans only doing what in honour and common honesty he was bound to do. But it was an act for which he deserves some credit. Honour and common honesty are not universally found in small impetuous States. It was something that the Viceroy should have refused to listen to the suggestions which repeat experience must have whispered to him as to the comfortable and easy way in which many republics, and even sovereigns, go off while setting their creditors at defiance. And, although the advisers to whom he gives ear are not always of the best kind, he is willing, and even eager, to pay attention to men on whom he can really rely. He does not like to sink below the standard which a European of honour and high standing assumes when addressing him. Considering, for example, as he was amply justified in considering, the uprightness, unselfishness, and straightforward simple energy of Colonel Gordon, he has lately invested that admirable officer with powers of almost unlimited control over a vast district, so much so, that the last news is that Colonel Gordon has made a treaty of commerce with the King of Abyssinia. The Viceroy accepted, in November settlement, not only because he wished to see sacrifices for his creditors, but because he was reluctant to do less than what such men as Mr. Goschen and his colleagues told him he ought to do. On the other hand, the weakness of the Viceroy, and his absorption of every minute of his own personal control, has its disadvantage. He tries to do a great deal more than he can do well. He takes up a thing, is eager about it, and forgets it. He has the habits of an Oriental in business, and procrastinates until he is obliged to come to hasty conclusions, and manoeuvres when he really intends to go straight. And he bears the whole weight of the vast personal responsibility he is so eager to accept. Everything that goes wrong is set down at the door of the Viceroy. Every creditor who cannot get paid hates the Viceroy as his own special enemy. Every one who used to make money out of the Viceroy when he was rich, and can make no more now that the Viceroy is poor, curses him as the creator of bad times. Egyptian society now spends the hours in abusing the Viceroy which it used to spend in flattering him. He is perhaps according to human nature, he is perhaps to be blamed for what he does not do than credit for what he does do in the way of right.

Some people in England take an interest in him as presenting a curious mental phenomenon. They got it into their heads that last November, converted, like the puppets who have been

and they want to know whether the conversion is complete. They shake their heads and ask whether their pugilist is quite cured, whether he never shows a hankering after the familiar quart pots, and can pass a penny theatre without bestowing a wistful gaze on its door. Anything less like the real state of things in Egypt could not be imagined. The VICEROY goes on as he has always gone on; but he has shown, and shows, that he possesses qualities and will do things which in a despotic Turk deserve very high praise. A large portion of the English public, however, regards the VICEROY from a much humbler and more material point of view, and merely inquires whether there is a reasonable chance of the interest on the Egyptian debt being paid. If there is something to disquiet, there is very much to reassure them in the present condition of the country. In some respects Egypt is very well governed. A traveller may pass unharmed from one end of Egypt to the other, and be as safe as if he were walking in Fleet Street. The population is submissive, laborious, and full of a sort of native infantine intelligence. The army is brave, and, when not starved, is free from discontent. The princes of the Viceregal family have received and profited by a European education. The agricultural resources of the country are great, and the amount of money which Egypt earns by its exports is surprising. The European institutions also, which the VICEROY has recently adopted are a reality. They work, and work well. The new tribunals have a solid power. They are in the hands of men some of whom are of conspicuous ability, and the very fact that a settled system of law on the European model exists at their doors raises and stimulates the minds of Egyptians.

Then the control over the finances which has been already introduced is very efficacious, and promises to be more and more efficacious as time goes on. It is not to be supposed that everything is encashed which ought to come into the treasury, or that all the inveterate abuses of Egyptian finance have been swept away. The European administrators have before them a period of slow, silent, fatiguing combat. But it is absolutely impossible that, while the present system continues at all, very large sums should fail to come into the hands of the creditors. The security of the creditors is that either the machinery now at work must be stopped altogether or many millions a year must be placed at their disposal. The VICEROY might change his mind and destroy the machinery he has suffered to be imposed on him. But there is little probability of this, as he would in so doing abandon all the aspirations of his life and run a serious political danger. His successor, again, might have different views, and long for a state of happy freedom from European control. But this again is not very likely, as in a few years the existing machinery will have become a recognized part of Egyptian life, and a new VICEROY will accept European control as a necessary part of his heritage. Perhaps the only serious danger that menaces Egyptian securities is that of Egypt being drawn into the vortex of Turkey. A war might oblige it to postpone every other consideration to that of the duty and necessity of upholding the SULTAN, and Egypt could not at the same time pay its creditors and engage in an expensive war. Or Turkey might itself venture to interfere in Egypt, and set up its own peculiar kind of rule in a province the independence of which is never recognized at Constantinople except when money or fear compels the recognition. Against the possibility of such dangers existing is to be set the equal possibility that England and France might not allow them to exist; and at any rate, if political dangers are averted, there seems no ground for supposing that Egypt is not as likely to pay its creditors as any State can be said to be which is not in a position of complete and unimpeachable solvency.

THE PROTOCOL.

NOTWITHSTANDING the acceptance by the English Government of the latest Russian version of the Protocol, the uncertainty which has long prevailed is not yet dispelled. The English Government has plausible reasons for insisting on a formal undertaking by Russia to disarm; but, if the demand is rejected, there will be much reason to regret the abortive issue of a complicated negotiation. If peace is intended, the army in Bessarabia will, with or without a promise, be withdrawn; and, on the other hand, no Protocol would interfere with a deliberate purpose of war. It is scarcely credible that Russia should

precede a rupture by a diplomatic undertaking to remain at peace. The advocates of coercive measures against Turkey are consistent in regarding the pending negotiations as elaborate trifling. The discovery of a formula which may satisfy both the Russian and English Governments will not directly ameliorate the condition of the Christian subjects of the Porte. In the most vigorous form which it has at any time assumed, the Protocol probably fell short of the stringency of the Berlin Memorandum. It has been understood through the whole course of the discussion that there was to be for the present no interference in the internal affairs of Turkey, although the main object of Russia has been to obtain a European recognition of some kind of separate or joint responsibility for the welfare of the Christian population. For a year and a half the English Government has for the most part, though not uniformly, disclaimed the duty of protecting the subjects of a foreign Power. The principal exceptions to the habitual policy of England were Lord DERBY's celebrated despatch on the Bulgarian atrocities, and perhaps some of the language which was held at the Conference. The remonstrances and demands which were addressed to the Ministers of the SULTAN undoubtedly seemed to imply either a right or a purpose of interference. Lord DERBY perhaps for the moment forgot that the withdrawal of protection compromised or destroyed the influence which had been accumulated during the period when England was considered the inalienable ally of Turkey. Nearly all the demands contained in the despatch have been neglected or evaded with an impunity which might have been foreseen. When the Conference met, the Turkish Government probably thought that England was scarcely less hostile than Russia. Hopes were perhaps still entertained of a political rupture between two Powers which were supposed to have opposite interests; but it was not thought worth while to purchase by concessions a support which was expected to result from the operation of selfish motives. The Turkish Government also trusted that the ancient policy of England would be so far maintained as to ensure neutrality and abstinence from the use of force. They were well aware that the September despatch was but an episode in a policy which was principally directed to the preservation of peace. An amicable arrangement with General IGNIATOFF, followed by Russian disarmament, will accomplish the primary object of the negotiations. If Bulgaria is still misgoverned, the yet greater evil of a war of conquest will have been averted. Lord DERBY's success may naturally appear to Mr. GLADSTONE's followers an ignominious failure.

Diplomatists ought to be as careful as lawyers to express international contracts and engagements in terms which involve the least possible ambiguity. If their efforts frequently seem unsuccessful, the cause of failure is often to be found in the intrinsic difficulty of the case. Sometimes one of the parties to the contract deliberately intends to leave a loophole for future evasion; and even when all the negotiators are equally sincere, they have to deal with contingencies and complications which cannot be certainly foreseen. If the details of the recent exchange of diplomatic drafts between the English and Russian Governments are hereafter published, it will probably appear that the verbal criticism which indicates either latent designs or unavowed suspicions has been carried to the extreme point of nicety. It is said that a proposal to concert eventual "action" was modified into a mention of "measures to be taken," and that ultimately the phrase resolved itself into "means to be adopted." Although it is right to take due precautions, excessive solicitude for accuracy of language might be modified by the consideration that great Powers, although they may be ready to discharge plain obligations, will not be controlled in their policy by a minute or sophistical interpretation of doubtful language. Lord DERBY was probably admit a liability to any kind to be adopted for a certain the discretion of the Government which could be evancer would tion; nor, again reasons or prote war. An und interval of pe quarrel which It is not a watching and been entrusted

exclusively to England. When the Eastern complications began, Russia, Austria, and Germany affected to undertake the exclusive management of all negotiations, except that from time to time they graciously invited England and France to accept their decisions. Since the collapse of the Berlin Memorandum it has suited the purpose of all parties to thrust England into the front; nor has Russia been displeased with an arrangement which seemed to be founded on the assumption that an aggressive policy was distasteful to one only of several Governments. It is perfectly well known that Austria is more directly interested in the Eastern question than England, and that France and Italy are anxious for the maintenance of peace; but Russian proposals are carelessly considered or accepted by the Continental Powers in the confidence that, if they involve any serious danger, they will be rejected by England. Lord Derby has more than once found himself in the position of virtually representing nearly all the other Governments. If he succeeds in proving Russia with an excuse for disarmament without incurring any serious liability, he will have done a great service to the Governments which were unwilling to run any risk or to encounter odium. The Russians have perhaps been disappointed to find that the English Government is not yet controlled by popular agitation. Prince Gortchakov has perhaps reckoned too sanguinely on the sympathy of Mr. Gladstone, as Nesselrode formerly relied, with various results, on the supposed influence of Mr. Combes. In other countries there has been no disturbing tendency of popular feeling. The prevention of war is throughout the Continent regarded as more urgent than even the protection of the Christians in Turkey.

As there is now a great balance of probability in favour of an immediate agreement between England and Russia, the dangers which have long threatened Turkey might have disappeared but for external and domestic complications with which the Great Powers are not immediately concerned. The difficulty which has arisen in the formal conclusion of peace with Servia will probably not be found insurmountable, but the arrangement of terms with Montenegro has not yet been accomplished, and it is not easy to understand how the conflicting claims are to be reconciled. Popular feeling is said to have become hostile to the present Ministry, if not to the Sultan, on account of the concessions which have been made to enemies or rebels. It would appear that those who influence Turkish opinion are incapable of appreciating the isolated position of the Government, or the comparative inefficiency of the army. The Parliament which has commenced its first Session commands no confidence, and probably excites little interest. The projects of legislation which have been laid before it have little connexion with the urgent wants of the country. New laws will not prevent the Mahometans of the provinces from oppressing their Christian neighbours; and no progress has yet been made in the establishment of a strong police which ought to be employed in the forcible maintenance of order. The revival of the insurrection in some parts of Bosnia is dangerous, not only from the exertions which it may render necessary, but because it will too probably give occasion for outrages which may perhaps once more provoke the indignation of Europe. The disarmament which must necessarily follow a similar measure on the part of Russia, although it will relieve the Turkish finances from a heavy burden, involves serious risks. The troops which have been collected from all parts of the Empire may become formidable if they are hastily disbanded. All the existing embarrassments might be overcome by a prudent and vigorous Government; but there is no reason to believe that either the present Ministers or their possible successors possess the qualities of statesmen.

GERMANY.

WHEN the life of men in high station is prolonged beyond the ordinary span of human existence, opportunities are continually recurring for bringing to the notice of the world that a round and large number of years have elapsed since something happened in their career. It is little more than two months since Germany invited an admiring public to observe that it was seventy years since the Emperor entered the army. Now Europe is requested to take notice that it is eighty years since the Emperor entered the world. Each occasion has been

seized as an opportune moment for the composition of a eulogistic biography of a sovereign who is now as much loved by his subjects as he was once hated by them. It is impossible, however, that the most adroit biographer should have anything to say about the Emperor in March beyond what was to be said of him in January, and we are taken once more over the familiar ground of Jena, of Leipzig, of the struggles of 1848, of the quarrels between Prince and Parliament, and of the astonishing successes of Sadowa and Sedan. The chief result of studying any biography of the Emperor must be an impression of his extraordinary good fortune. He is the most conspicuous instance in history of a man who has had greatness thrust upon him. But at the same time it may be fairly said that he has done something to deserve success. He has shown at every crisis of his long life a great and unusual amount of common sense. He has judged men and events rightly when critics who smiled at his pretensions to capacity have been wrong. The national movement of 1848, though due to feelings which were most creditable to the nation, was incontestably premature; and the Emperor, by insisting on its defects, saved Prussia from committing a gross blunder. Subsequently he was the chief, if not the sole, author of the scheme of army reform which ultimately produced such brilliant results; and his unconstitutional resistance to his Parliament in the many contests which the maintenance of his scheme provoked had the justification that, unless he could get together an army strong enough to beat Austria, not only was German unity an impossibility, but Prussia was doomed to be the slave of neighbouring despotisms. In his later life he has shown his sense chiefly by his submission to the guidance of Prince Bismarck. He has had to do, to overlook, or to sanction many things very little to his taste, in order to comply with Prince Bismarck's imperious wishes. But he had the clearness of insight necessary to teach him that, if Prince Bismarck was to be used at all, he must be allowed to work in his own way. The Emperor has not been a docile tool in the hands of his Minister. On the contrary, he has often followed with undisguised reluctance the advice peremptorily given him. His merit—said in a sovereign it is a great merit—has been to see that, if he once accepted a policy much larger, bolder, and more unscrupulous than any he could have devised, he could only reap the fruits which his acceptance promised to ensure him if he honestly recognized that, having chosen the end, he must also choose the means.

Although, however, he is never now thwarted and little restrained by the Emperor, Prince Bismarck finds that his work never comes to an end. He always discovers new difficulties and fresh grounds of quarrel. The world will not go in the way he wishes, and there is always some opposition to be overcome or endured, and some obnoxious person to be crushed. He has lately had to employ himself in warning his countrymen against the growing strength of particularism, and in procuring the resignation of General Stosch. The offence of the General was that, as Minister of Marine, he had accepted a proposed reduction in the Navy Estimates without consulting the Chancellor. The question at issue was, if stated in the way most favourable to Prince Bismarck, whether the German Ministers are independent heads of departments or members of a Government of which Prince Bismarck is Prime Minister. If stated in a way less favourable to the Chancellor, the question may be said to have been whether any one, however useful and able as a public servant, is to be crushed if he offends a man who is always ready to take offence. Theoretically, Prince Bismarck is right in saying that Parliamentary government is impossible unless his colleagues are bound to consult, and within reasonable limits to obey, their chief; but Prince Bismarck is so habitually engaged in crushing somebody that there is always room for doubt whether in any particular instance his victim has been fairly crushed or not. At present his general irritability is likely to be increased by the vexations of his Parliamentary position, and especially by the growth of that spirit of particularism of which he so bitterly complains. As he states that this spirit is growing, it may be assumed that he has good grounds for the statement. The one conspicuous instance in which the spirit he so much dreads and detests has lately manifested itself would not seem to imply more than that, when he deserves a rebuke, the German Parliament has the courage to administer it. It has been decided, in opposition to Prussia, that the

seat of the new Supreme Tribunal of Germany shall be fixed at Leipzig instead of Berlin, and this decision was expressly based on the ground that recent exhibitions of servile partiality had made Germany distrust Prussian Judges. The conduct of the ARNIM trial was certainly but little calculated to make the inhabitants of other States confide in the independence and moderation of the tribunals of Berlin; and although, to please Prince BISMARCK, the German Parliament adopted provisions in the new Code which will facilitate trials like that of Count ARNIM, it was reasonable to think that these provisions would become doubly dangerous if worked by the Judges who had condemned Count ARNIM in a sentence obtained without publicity and ludicrously severe.

The portion of Germany in which particularism is not a growing spirit, but a passionate and general feeling, has had at last some concessions made to its wishes, and the affairs of Alsace-Lorraine are to be, within certain bounds, determined by a local Parliament, and not by the Parliament of Germany. Such a body as an Alsatian Parliament, although little heard of, has been for some time in existence; but its only function has been to prepare Bills for the Imperial Parliament to discuss. This body is now to have its sphere of activity increased as a reward for the indications it has offered that the alienation of the conquered provinces from Germany is diminishing. More than a majority of the registered electors have condescended to vote for the members of whom it is composed, and it has itself shown signs of what Prince BISMARCK good-naturedly calls loyalty. It is not easy to get at the truth as to the real state of things in the annexed territory. One deputy sent from Alsace-Lorraine to the German Parliament assured his hearers that his fellow-provincials were worse treated by the German authorities than Rayahs are treated by Turks. This may be safely put down as an exaggeration; but there is no reason to doubt the sad picture recently drawn by another deputy of the lamentable condition of Metz, where ruin reigns supreme and beggary stares a desponding population in the face. It is difficult to see how a French garrison town, turned suddenly into a German garrison town, with a French population hating the garrison, could be likely to flourish. The remedy proposed by the deputy was the simple one of giving back Metz to France; but Germany must be beaten, and severely beaten, in a great war before Metz becomes again French; and, if it is to thrive in the meanwhile, it can only thrive by Germans finding that they can thrive by going to live there. The unhappiness of the French population of Metz has recently been increased by a stern order of the German Government forbidding soldiers of the French army of reserve to reside there. This in many cases means that the young members of Metz families are never to be allowed to go home to see their friends, and the harshness of the measure can only be justified on the plea of military necessity. In many small ways it seems to be the case that Germany is just not at war with France. The animosity of the two nations has not at all abated, although nearly seven years have now elapsed since the great war broke out which was the cause of so much heartburning. Metz is as much a conquered city as it was on the day when BAZAINE surrendered it. But, if the conquered provinces are spoken of as a whole, the work of pacification seems to have made real progress. The number of people who prefer to get on as well as they can with the Germans increases year by year. What the bulk of the inhabitants detest is not Germany, but German officials. If they could but be left somewhat more to themselves, they think life would be very endurable, although they had to pay taxes to a German treasury and furnish recruits to a German army. The measure proposed to the German Parliament will secure them an amount of independence which they incline to hope will be considerable. At the first symptom of what Prince BISMARCK would call disloyalty their bonds would no doubt be immediately tightened; but the mere fact that the CHANCELLOR thinks the time is come when a kind of local independence may be given them proves at least that what is going on in Metz cannot be taken as a fair sample of the condition and feelings of the provinces generally.

MR. BUTTS BILL.

IN considering the Irish Land Tenure Bill which was rejected by the House of Commons on Wednesday, there is no need to look beyond the last of the three parts into which it was divided. Provisions for the better securing of the Ulster Custom and for amending the Act of 1870 are only interesting when there is some chance of their being adopted. But provisions for displacing landlords by tenants are interesting even when there is no chance of their being adopted. They show the drift of opinion among the class on whose behalf they are put forward. In the case of proposals which the House of Commons dismisses so promptly, and by so large a majority, it may be thought that nothing is gained by ascertaining this. What is the good of finding out that it is the moon that a child is crying for? But the growth of a sound public opinion either in Ireland or elsewhere is a matter of slow and gradual progress. If the objections to the ideas which are at present popular in Ireland are not carefully set out whenever the ideas themselves are formally presented to Parliament, this painful process cannot be said to have begun. It is important, therefore, to show why the Imperial Legislature cannot listen to a plan which comes before it with a considerable show of Irish support. We are not so sanguine as to suppose that Mr. BUTT's next Land Bill will prove that its author has profited by the controversy started by the Bill of 1877; but it is possible that some future Land Bill will be the better for the examination to which its predecessor has been subjected.

Mr. BUTT proposes that every occupying tenant of land in Ireland, not holding under a lease, shall be entitled to apply for a declaration of tenancy at a certain fixed rent, and that after this declaration has been issued the tenant shall hold the land in perpetuity, subject to a periodical readjustment of rent. Thus the landlord will be converted into the holder of a perpetual annuity, rising or falling with the change in the value of the land, and with a right of resuming possession in the event of the tenant being guilty of certain specified acts. If the landlord and tenant cannot agree upon the rent to be fixed, it shall be left to the decision of three arbitrators. It will be seen that two distinct issues are involved in this proposal; one whether landlords shall be done away with; the other whether, assuming that they are to be done away with, they shall be done away with in this particular way. It will be most convenient to take the latter question first, and to inquire whether, supposing that Parliament had come to the conclusion that the land system of Ireland should be revolutionized by putting the tenant in the place of the landlord, it would be expedient to revolutionize it in the fashion favoured by Mr. BUTT. It is conceded, of course, that if a sufficient public necessity were made out, the State would have the same right to expropriate landlords for the benefit of tenants that it has to expropriate them for the benefit of Railway Companies. But under no possible circumstances would it be expedient to do this by maintaining the connexion of the landlord with the land while absolving him from all the duties which, imperfect as their obligation may be, are now held to attach to the connexion. There could not be a greater curse to a country than the creation of a huge body of idle annuitants. Idle landlords are bad, but they are only bad in the sense in which all men are bad who neglect their duty. They are not a permanent evil deliberately called into being by Act of Parliament. They are subject to public opinion, to the growth of better dispositions in their own minds, to the succession of heirs of better dispositions. But a body of annuitants is exempt from all these influences. If the Irish landlords were bought out by a sum of ready money, they would have the opportunity of employing it in other ways. They could buy land in other countries, or they could become manufacturers or traders. Mr. BUTT's plan would compel them, so to speak, to invest their capital in the funds, and to do nothing except spend the interest. Of all ways of improving Ireland, the most inconsequent is one which, in order to improve the material condition of one class, would inflict moral ruin upon another class. If Mr. BUTT is convinced that landlords ought to be abolished in Ireland, let him give these prodigal sons their portion, and send them out of the country, to make the best of it. It is only fair to Mr. BUTT to assume that he wishes the landlords to sustain no money loss from the change he proposes to effect in their position. He argues, no doubt, that under this Bill they would con-

time to receive the fair value of their land, and that, so long as they do this, they can have no reason to complain. But even if it be conceded that a perpetual quit-rent does represent the fair value of the land to a man who has hitherto regarded himself as its absolute owner, what ground has Mr. BUTT for feeling confident that the next agitation would not be an agitation to do away with quit-rents? The landlords on his theory will have been reduced to the position of mere pensioners. They will do nothing for their money; they will be just as much a burden on the tenants as if they were so many paupers or paralytics. How long will it be before a cry is got up against the injustice to a hardworking farmer of making him sustain this useless and unornamental incumbrance? Let landlords once become pensioners, and they will inevitably share the fate of other pensioners. It is not probable, however, that the process of robbing the landlord would be so long delayed. Even while his rent was paid him it would in many cases not be the fair rent. The relations between landlord and tenant in Ireland are rarely of a kind which allows arbitrators to be impartial. The landlord's arbitrator would give everything in the landlord's favour. The tenant's arbitrator would give everything in the tenant's favour. The umpire, having no employer to serve, would naturally be influenced by the general current of popular feeling, and would be inclined to decide in favour of the tenant. Even if by a miracle a perfectly fair arbitration could be had, it would still have the disadvantage of being a perfectly ignorant arbitration. The value of land is not to be arrived at by any process of measurement or inspection. It is like the knowledge of a man's character—a thing that can only be mastered by long acquaintance and careful study under various conditions.

Thus Mr. BUTT's Bill would be condemned in respect of the machinery even if were passed in respect of its object. But what is there in the circumstances of Ireland to lead us to suppose that the object is a good one? It will be admitted that a revolution in the holding of property ought to be justified by some strong public necessity. The ideas generated by such revolutions are of too destructive and inflammatory a kind to be raised without pressing need. Where is the evidence of this need in Ireland at the present moment? Mr. COURTNEY answers that the abolition of landlords would be in accordance with the historical conception of property in land as entertained by the Irish people. But if once Parliament is to start upon a voyage of discovery the object of which shall be the realization of historical conceptions, it is hard to say where it is to stop. Historical conceptions have a claim no doubt to be considered when there is some practical grievance to be redressed, or some practical evil to be set right. They had their proper place in the deliberations which preceded the framing of the Land Act of 1870; and if it should ever be shown that the condition of Ireland imperatively demands a revision of that Act, they would find a similar place in the deliberations of the future. But the only argument that can sustain Mr. COURTNEY's conclusion would be an absence of improvement of Irish land which could be traced to the relation of tenant to landlord. It is probable that no one who knows Ireland well, and is not biassed by political feeling, will say that there is even a pretext for such a conclusion as this. The Act of 1870 has protected tenants' improvements, and the result has been to show that Irish tenants scarcely know what improvement means. They may not be to blame for this want of knowledge; on the contrary, it may be the result of circumstances for which they ought not to be responsible. But the question at issue is not their innocence, but their ignorance; and so long as they have so much to learn about the capacities and the treatment of the land, it would be imprudent as well as unjust to deprive Ireland of a class which, with many faults, is still far ahead of the tenantry alike in experience and in energy.

THE PAPAL ALLOCUTION.

THE language of the last Papal Allocution will bear a favourable comparison not only with some of the speeches recently delivered in the Italian Parliament, but with many of the former utterances of Pius IX. himself. Its author has benefited by having in many respects a really strong case against the Italian Government. In his own opinion he has always enjoyed this advantage; but in order to admit this it was necessary to look at the questions

at issue between the two authorities from a purely ecclesiastical point of view. It is natural that the Pope should think the loss of his dominions and the confiscation of ecclesiastical property very real hardships; but to the world at large they seemed to be hardships of a kind that all ecclesiastical persons have to put up with in modern times. Disendowment in one form or another has been the lot of every part of the Roman Catholic Church during the last hundred years, and as in several instances the Pope has managed to live on very fair terms with the spoilers, there has seemed to be no reason against his doing in the case of Italy what he has already done in the case of Spain or Austria. There are some subjects upon which the lay and the clerical mind seem to be hopelessly opposed, and the ownership of Church property is one of them. In the Roman Catholic Church the claim of the Pope to be secured in the possession of his temporal sovereignty, without reference to his own ability or inability to retain it, is another such question. The laity in all countries regard ecclesiastical property and the temporal rights of ecclesiastical persons pretty much as they regard the property and the rights of everybody else. The clergy invest both with a special and mysterious sanctity, which is not to be overridden by any considerations, however urgent, of public convenience. Consequently, when in former Allocations the Pope has bemoaned the wickedness of men in depriving him of his States, or in turning monasteries and convents into public offices, his words have always seemed very much too strong for the occasion. Now, for the first time, so far as we remember, the complaint that his spiritual independence has been attacked has been brought forward with some solid reason. The Italian Government have abandoned their old attitude of reserve in ecclesiastical matters, and have openly interfered with the ordinary working of the Roman Catholic Church. The Pope does not assert that he is not free to do what he likes inside the Vatican. He only says that, if he does what he likes inside the Vatican, those to whom it falls to execute his orders are made to suffer for their obedience. This is a novelty in Italian legislation, and it is a distinct departure from the kind of acknowledged compromise which had been entered into between the Church and the Government.

The Allocution singles out two features in this new policy as being aimed at the freedom of the Pope as regards his purely spiritual functions. The first is the attempt of the Government to prevent both the formation of new religious communities and the continuance, under new conditions, of communities which have been suppressed by law. This charge is mixed up with the more familiar accusation that property originally given and held for pious uses had been confiscated to the State, and some Englishmen have not noticed that it has now for the first time been introduced into the indictment. It is not only the suppression of the religious orders that the Pope complains of. That is an old story by this time, and, in the sense in which suppression has been interpreted, it has been found quite compatible with the continuance of the community life of the members of these orders. The old monasteries and convents no longer shelter their former inmates, and the civil law leaves them free to return to the world. A minority, no doubt, of the ejected religious have used this permission, but the majority have probably no wish to do anything of the kind. For many of them the world has no place, and, even if it had, the force of public opinion would prevent them from filling it. The existing Italian Government does not represent Italian Catholic society, and a nun who pleaded the suppression of her order as an excuse for abandoning the religious life would find herself as much lost to her family and her friends as though a wife pleaded a new law of divorce as an excuse for leaving her husband. Besides this, Italy is still a Catholic country, in spite of the assertion of a Radical deputy that it contains twenty-seven millions of atheists, and by far the larger proportion of the members of the suppressed orders regard the obligation of their vows as in no way lessened by anything that the State has done. Consequently, though religious orders are no longer recognized or endowed, religious communities identical in all respects with the suppressed orders exist everywhere. The ejected monks and nuns have as a matter of course associated themselves under the same vows as before, and as adversity has naturally a purifying influence, a new zeal for the religious life is growing up in Italy. We have not seen the Ministerial ordinances which are mentioned in the Allocution, but they are no doubt framed in the spirit

of a Ministerial circular on the subject to which we called attention at the time it was issued. The drift of this circular, was that, as the destruction of the nests had not made the birds fly away, some other means must be tried; and the Italian law, which leaves people free to associate themselves in any manner and for any object that may please them, must be modified to the injury of Catholics. In the eyes of the present Italian Cabinet liberty becomes license when it is enjoyed by the wrong persons.

The carelessness of English newspapers has prevented the true character of the Clerical Abuses Bill from being appreciated in this country. The readers of the *Saturday Review* have already been made acquainted with its provision, and are aware that they are designed to make the ordinary administration of Roman Catholic ecclesiastical discipline impossible except in the continual prospect of fines and imprisonment. In so far, therefore, as the Pope is affected by acts done to his clergy he is not free. He is free, that is to say, to command; but they will be punished if they obey. To punish a priest who, in the exercise of his office, "perturbs the public conscience or the peace of families," is really to punish a priest who does anything under the sun that may chance to be distasteful to the Government. Had such a law existed in England the leaders of the great religious movements of this and the last century would have spent most of their time in gaol. The peace of a family is "perturbed" whenever any member of it adopts religious opinions or practices differing from those of the head of the family; and the public conscience is "perturbed" whenever a preacher comments unfavourably upon any act of the Government. There are half a dozen Acts of Parliament at this moment which English clergymen of one school or another are striving to get repealed, and every single instance of such opposition would bring them under a law like that by which the Italian Ministry propose to imprison any priest who "expressly censures" the institutions or laws of the State, a Royal decree, or any other act of public authority. The liberty of the Pope is still more directly infringed by the clause in the Bill which makes it penal to publish or distribute any such censures, "from whatever ecclesiastical authority and from whatever place they may emanate." To ordinary minds the freedom of the Pope to govern the Italian Catholics seems to imply as its corollary the freedom of Italian Catholics to be governed by the Pope. Thus the Clerical Abuses Bill completely bears out the description of it given in the *Allocation*: and if the Pope had confined himself to protesting in the face of Europe against the flagrant contradiction between the acts and the professions of the Italian Government, he would have occupied a position from which it would have been impossible to dislodge him. Unfortunately for the cause of ecclesiastical freedom, there seems reason to suppose that the framers of Roman policy intend to make the violent and impolitic action of the Italian Ministry the occasion of a new attempt to restore the temporal power to its place among European questions. In the present unsettled condition of Continental affairs, they probably think that nothing is altogether impossible, and they are willing to set the certain loss of Italy against the more than doubtful prospect of regaining Rome. It is certain to be a disastrous choice, alike for the tranquillity of Europe and for the spiritual interests of the Roman Catholic Church; but we do not know that on either of these grounds it is likely to find favour at the Vatican.

THE CHINESE IN CALIFORNIA.

It is not surprising that a Committee of Congress should have reported in favour of measures tending to check Chinese immigration into California. The institutions which are of all others the most convenient and elastic within their proper limits are naturally found inapplicable to less simple social conditions. American laws and customs are based on the assumption that all men are not only equal, but in some degree similar; and for practical purposes the theory has until lately approximately corresponded with the facts. The cellular organization of States and Territories has afforded unequalled facilities for expansion beyond the comparatively narrow space which was occupied by the colonists when they first attained independence. The remnant of the old Dutch settlers formed a kind of viscerosity in New York long after they had adopted

English speech and habits. The French in Louisiana and the sparse Spanish population of Florida readily acquiesced in a political system which involved the smallest possible interference with local interests and tastes. The influx of Irish and Germans in recent times has sometimes caused annoyance to the indigenous American citizens; but both classes of immigrants have entered with even excessive activity into the political controversies of their adopted country. In many parts of the North-Western States there are now communities which speak German, Norwegian, or even Welsh; but it is only by immigration that national distinctions are maintained. In two or three generations English will be the language of almost all the population which will have been born on American soil. The rapid assimilation of foreigners from Europe is at present illustrated by the presence in the Cabinet of Washington of an eminent orator and politician who was thirty years ago well known as a German malcontent. The founders of the Republic and their successors to the present time have for sufficient reasons made an exception to the prevailing uniformity of political rights and duties. The Indian tribes have been regarded as aliens, subject to a dependence which was defined by special legislation. If the surviving descendants of the aboriginal inhabitants were, like a few of these scattered communities, to become settled and industrious, no impediment would probably be placed in the way of their claims to political equality.

The admission of the emancipated negroes to the franchise immediately after the war severely strained the Republican fabric. Aided by the favour of the dominant party in the Government and in Congress, the new voters, as might have been expected, abused their power by entrusting the administration of several Southern States to corrupt and factious adventurers. A reaction which was plainly inevitable, though it might be difficult to determine beforehand the date of its arrival, has already in the greater part of the Southern States enabled the white citizens to assert their natural supremacy. Although the Constitutional Amendment which prohibits distinctions founded on race and colour is not likely to be repealed, the negroes will find it necessary to exercise the franchise in accordance with the claims of the only class which is competent to govern. In future times the coloured population may, perhaps gradually become more fit to share political power. There has not yet been time to test the capacity of the negro race in favourable circumstances; but sanguine philanthropists may derive encouragement from the remarkable progress which has been achieved under the disadvantage of slavery. The KELLOGGS and the PACKARDS are not perhaps satisfactory statesmen, but they approach much more nearly to the highest American type than to the fetish-worshipping savages from whom they are descended. On their own continent Africans seem to be irreclaimable, but after two or three generations of servitude they begin to resemble inferior Europeans. The slave-trade may perhaps eventually prove to have been the first cause of negro civilization. The mimetic instinct of the negro race tends, like the similar faculty in children, to accelerate the process of unconscious education. The debates of a South Carolina Assembly may probably be at once amusing and repulsive; but a caricature indicates a conception of the original character. Factions are but debased copies of political parties; and imperfectly pronounced English is a better organ of thought than an African jargon. The next generation of coloured Americans will, for the first time in the history of the race, have enjoyed the benefits of elementary education.

The Chinese, who have now for some years overflowed from their own crowded country into the Pacific States, are much more impracticable. The negroes would willingly, if natural distinctions could be obliterated, merge themselves in the general mass of American society. Their crude politics and their religion are borrowed from their former masters, and even when they encourage the embezzlement of public money they are faithfully copying their models. The Chinese has opinions and customs of his own, and, if he had a vote, he would either decline to use it or openly sell it to the highest bidder. The habits of the race will probably be modified by habitual emigration to foreign countries; but for the present the Chinese is only a temporary resident in foreign lands. His family relations are necessarily connected with his home; and the immoral habits which shock public feeling during his temporary sojourn in America are less surprising than offensive. The extreme unpopularity of the Chinese may nevertheless be

chiefly attributed to his merits rather than to his faults. His strength, his untiring industry, his mechanical aptitude, and his extreme frugality make the Chinese a formidable rival of the Irish, who do the greater part of the hard work of the United States. Under the dominion of universal suffrage, cheapness of production is regarded as less advantageous than the maintenance of high wages. Employers and purchasers are sacrificed to the supposed interests of workmen, who forget that they are themselves consumers. The protests against Chinese immigration which have been considered by the Committee of Congress are really directed against industrial rivals rather than against discreditable heathens; but legislators have to deal not with motives, but with reasons; and the arguments which are urged against the admission of obnoxious foreigners are not without force, nor are they perhaps wholly insincere. If the Government and the Legislature yield to popular pressure, there will be some difficulty in disposing of the engagements with the Government of Peking which were contracted for the purpose of facilitating the settlement of American traders in China. It is too much to demand that foreign traders should be hospitably received by a community which is, according to the proposal, to be excluded from the United States. If the difficulty is overcome, it will probably appear that antipathy to Chinese labour is not universally entertained in California.

The pressure of population in some parts of China sufficiently accounts for the increasing tendency to seek subsistence in foreign countries; and the enormous numbers of the inhabitants of the Empire give importance to the movement. The old *officium gentium* in Scandinavia or Central Asia were thinly inhabited, although the great migrations towards the South proved the existence of a surplus population. The Chinese, if they are impelled by similar causes to precipitate themselves on foreign countries, will be counted not by thousands but by millions. An effort of imagination is required to render credible the Chinese statistics which have for a century and a half been recorded in school books. Ten times the population of the United Kingdom obeys a single Government, and a moderate percentage of emigrants would assume the dimensions of a nation. The obstinate and hardy Chinese will not easily be confined within their own boundaries if they are bent on expansion. Less versatile than the Japanese, they have perhaps a stronger character; and their considerable facilities are exclusively devoted to practical objects. The Imperial Government has within a few years recovered nearly all the provinces which were detached from the Empire by Mahometan rebellions. It is at least possible that hereafter the Chinese may push back the Russian conquerors of Central Asia by mere superiority of numbers. Their peaceful invasion of California and of Northern Australia may be more easily prevented; and it seems probable that the United States may adopt prohibitive legislation. The economic loss will not be inconsiderable, but there are undoubtedly strong objections to the presence of uncongenial foreigners who permanently reject amalgamation with the general community.

LIBERTY OF THE PRESS IN FRANCE.

THERE are some triumphs which become almost legitimate by reason of their complacency, and M. PAUL DE CASSAGNAC may claim to have achieved one of them when he forced M. JULES SIMON to ask leave to proceed against him under the press laws. The PRESIDENT of the COUNCIL has spent his life in preaching liberty of thought and liberty of speech, and to be able to point to him as a man who wishes to silence his opponents because he cannot answer them is a very delicate morsel of revenge for a Bonapartist deputy. M. PAUL DE CASSAGNAC knows how to push his advantage; and, however content M. SIMON may have felt with the speech he was going to make in return, he had at least the annoyance of knowing that his enemies on both sides of the Chamber would maintain, and perhaps honestly believe, that he had been driven into a corner from which there was no escape. It must be admitted that the PRIME MINISTER did not make his way out by quite the best road. The true rejoinder to M. PAUL DE CASSAGNAC is that the liberty of the press, like every other liberty, is subordinate to the safety of the State. The error of those who violate the liberty of the press is, not that they exaggerate the importance of this primary consideration, but that they mistake the means by which the safety of the State is to

be promoted. If an avalanche were hanging over a village, and might be drawn down upon it by the slightest sound, it would be right to forbid a mother to sing to her infant. Where the assailants of the liberty of the press commonly go wrong is in fancying avalanches where there are none, or in thinking that their course can be diverted either by sound or silence. M. SIMON did not simply entrench himself behind general considerations of this kind. He described M. PAUL DE CASSAGNAC's theory very truly in the words of a more eminent man as consisting in this formula:—"We demand liberty from you when you are in power in virtue of your principles; we refuse you liberty when we are in power in virtue of our principles." If this theory were admitted, argues M. SIMON, the friends of liberty would be the mere dupes of their own professions. Whenever the weapon they had forged for their own advantage happened to get into the hands of their adversaries, it would at once be used to their injury. M. SIMON did not define to what extent it would be lawful to withhold liberty from those who ask for it from sinister motives; but he certainly implied that there must be some amount of reciprocity between those who have it to give and those who have to receive it. This argument is indistinguishable from the reasoning so popular with half-instructed persons, that there must be no freedom of trade unless the country to which we concede it is willing to concede it in return. Those who maintain this doctrine are the victims of a wrong conception of who it is that is benefited by Free-trade. They hold, for example, that, if England admits French goods free of duty, while the French refuse to admit English goods except on payment of duty, it is France that gains and England that loses. It is the same with freedom of the press. What is it that prevents, or rather that ought to prevent, Liberal Governments from attempting to check political discussion? The conviction that it is the person who institutes proceedings of this kind, not the person against whom they are instituted, that suffers from them in the long run. If this fact is once recognized, it makes not the slightest difference whether your adversary is prepared or not prepared to extend similar liberty to you. If he does not, he will be injuring himself a great deal more than he can possibly injure you; and why should you have any desire to protect him against his own blunders? A really wise politician who cherished a rooted spite against the Imperialists would desire nothing better than to see them denying freedom of speech to their enemies. He would welcome it at once as a symptom of present alarm and a sure forerunner of future disaster.

This consideration supplies an answer to M. PAUL DE CASSAGNAC's assertion that the Government prosecute writers who assail the Republic, while they let writers who assail things far more sacred than the Republic go scot free. Outrages, he says, against religion and morality are committed every day, yet you pass over these without notice, to single out a writer who at the very worst has only been guilty of an outrage upon the Republic. Monks and nuns, priests and bishops, and names yet more sacred than any of these, are constantly insulted in the grossest possible fashion, and the Government apparently see no harm in it. It is only when the Republic comes in for a little of the abuse which in the opinion of many Frenchmen it richly deserves, that prosecutions are at once set on foot, and that the Chamber of Deputies is asked to suspend the inviolability which ordinarily attaches to its members. But the distinction is justified by the fact that institutions which depend for their permanence on their ability to create conviction in the minds of those to whom they appeal cannot possibly be benefited by any process which ignores the necessity of conviction. It would be no real service to religious orders to shield them from hostile criticism, even when that criticism takes a very gross and vulgar form. The only result would be that what is said now by a few would be suspected by a great many more, and the circumstance that certain specific charges are not allowed to be brought against the religious life would be used as conclusive evidence that the charges in question were true. It may be objected that this proves too much, since civil governments also depend for their permanence on the public conviction of their utility, and that if they are sheltered from challenge this conviction will have no chance of growing up. Unfortunately it is seldom possible, least of all in France, to argue this question in a sufficiently abstract spirit. The practical conclusion at which the challenge almost always points is that the Government which the writer

dialikes had best be got rid of at the first opportunity. If M. PAUL DE CASSAGNAC had been content to preach the superiority of a particular variety of monarchical government without any direct reference to the particular circumstances of France, it is very unlikely that he would have been interfered with. At all events, there is no doubt that it would have been exceedingly unwise in a Republican Government to interfere with him. But a writer who preaches the propriety of substituting a particular variety of monarchical government for the Republic, and at the same time belongs to a party which makes no secret of its intention to carry these views into action whenever the occasion presents itself, is really committing what is as much an act of overt hostility to the Government as though he shouldered a musket and took his place behind a barricade. If he is not guilty of technical treason in his own person, he is doing his best to make others guilty of it; and, as soon as this is recognized, the right of the Government to take measures to silence him follows as a matter of course. Whether it is wise to take these measures in the present instance is of course a quite different question. But it is a question which concerns simply the prudence of the course adopted, not the right of the Government to adopt it. In order to have a decisive opinion upon this point, it would be necessary to know a great deal more of the actual condition of French parties and French opinion than is often possible for foreign observers. All that can be said is that M. SIMON is right in prosecuting M. DE CASSAGNAC if the Republic would be endangered by letting him alone, and that he has better means than most people of knowing whether the Republic would have been safe if M. DE CASSAGNAC had not been prosecuted.

THE STOCK EXCHANGE.

THERE seems to be just now a curious weakness in the management of Government business in the House of Commons. Even thus early in the Session a number of obvious errors have been committed, either from carelessness or blindness. A great mistake was made in allowing the impudent Colonial Marriage Bill to slip through a second reading, and also in the perverse hostility of the Treasury Bench to the principle of the Ancient Monuments Bill. And now again this week another extraordinary display of confusion of mind and want of judgment was made on Tuesday, when Mr. R. YORKE moved for a Royal Commission to inquire into the constitution of the Stock Exchange, and to report whether it required amendment in any way. Mr. STANHOPE, the Under Secretary of the Board of Trade, was at once put up to resist the motion in the most unequal manner; but as the debate went on it soon became evident that, though there might be some difference of opinion as to what particular legislation was desirable, there was a strong and general conviction that the present condition of the Exchange offered quite enough to justify a searching inquiry, and the CHANCELLOR of the EXCHEQUER had to yield, in order to avoid a humiliating defeat. Sir S. NORTHGOTE, while throwing over the UNDER-SECRETARY on the question of issuing a Royal Commission, theoretically supported his line of argument in favour of leaving the Stock Exchange to do just as it likes; and very poor argument it was, amounting only to this—that, on the whole, more good business than bad business was done on the Exchange; that it was dangerous to encourage the public to rely on legislation instead of on itself; and that, if Parliament once tackled the Stock Exchange, it would be bound to deal in a similar manner with some other interests. These objections are easily answered. The amount of good business done on the Exchange may for the present preponderate, but the bad business has been steadily increasing, and corrupting the whole spirit of the organization and the character of the members. As to the public relying on itself, and not on others, it is at present helpless, simply because the Stock Exchange is an arbitrary monopoly which on all occasions consults the interests of its own members, rather than those of the public. And, again, to say that one scandalous abuse is not to be touched lest there should be others requiring attention is too idle a plea to require an answer. What would be the good of a Government or Parliament which allowed itself to be continually paralysed by such considerations? It is clear that on any

view of the matter Sir S. NORTHGOTE put himself in an utterly false position. If he thought inquiry mischievous, he was bound to do all he could to arrest it; as he allowed it, he should have reserved his arguments on the general question until the inquiry was completed and he was in full possession of the facts.

When we turn to the actual position of the question, the case for an inquiry is seen to be overwhelmingly strong. Last year the Foreign Loans Committee, in taking evidence as to its own special subject, incidentally obtained an insight into the practices of the Stock Exchange; and some observations on the latter are contained in its Report. The Committee points out that the Exchange is a voluntary society which exists for the purpose of buying and selling, to which all other functions are subordinate; and that from its composition, it is quite unfit to be trusted with judicial power, especially in regard to "questionable proposals by which it alone, of all the public, is certain to benefit." The regulation of the stock market by the Exchange is confided to a Committee of jobbers or brokers, who act in a judicial capacity on matters in which their own interest is frequently concerned; and the public is entirely dependent on this body for its opportunities of buying and selling, and for the conditions under which such transactions take place. It has also been shown that the Stock Exchange has not only permitted, but connived at, and in a certain degree shared, the profits of combinations called syndicates, got up for the express purpose of deluding the public into paying an artificially high price—made up by sham arrangements between members of the Stock Exchange and contractors—for doubtful securities. When contractors applied for a settlement, the Committee of the Stock Exchange accepted their statements as to the good faith of the scheme and the amount of allotment, as a matter of course, without the slightest inquiry. Yet it was very well known that, as soon as an allotment was granted, a large proportion of the stock would return into the hands of the contractors, and be withheld from the public, in order that fictitious premiums might be created. It is, of course, essential that these operations should be performed in profound secrecy; and the Stock Exchange Committee, which is supposed to be a check on frauds, deliberately shut its eyes and ears, and supplied the necessary cover for what was clearly a system of swindling. Moreover, it came out that the money of the allottees was used in some instances in paying for stock purchased in excess of that sold. Thus the victims were both deceived and robbed.

It is obvious that when a Company is brought out, the public cannot judge of its soundness unless the whole of the expenditure which is contemplated is truthfully disclosed. In one case, as to which Mr. CAZENOVE was examined, the prospectus represented that the borrowing State was to get 80 per cent. of the loan, and pay 8 per cent. on it, the fact being that it was to receive only 64 per cent., and to pay 16 per cent.; and the witness admitted that, if this fact had been known, it would have at once put an end to the scheme. Yet he held that the system under which such things happened should not be interfered with, for that would injure Stock Exchange business. Mr. COHEN also admitted that, if a man signed an open public contract that the charge to a Government for raising a loan should be only six or seven per cent., and at the same time signed a secret contract that the charge to the Government should be four or five per cent. more, it was an "immoral act"; but he seemed to think that, if the offence could not be reached by law "without hampering and fettering trade," it should be winked at. A President of the Board of Trade once argued that it is better to tolerate fraudulent adulteration than to hamper and fetter trade; but the doctrine was not approved by the public, and has not been acted on by Parliament. Mr. N. M. DE ROTHSCHILD, although admitting that the practice of publishing deceptive statements in prospectuses was not exactly proper, thought that a Government in making a loan had a right to conceal any facts which would damage its acceptance by the public. It is, no doubt, true that there are many respectable men on the Stock Exchange, and that the persons by whom frauds of this kind are immediately carried on are not themselves members of that body; but it is unfortunately too evident that the Stock Exchange finds it to its interest to permit and facilitate these operations, and allows helpless investors to be

sacrificed. Indeed the most melancholy and ominous part of the evidence in the Foreign Loans Committee's blue-book is perhaps not so much the details of actual roguery, as the disposition manifested by the more respectable witnesses to extenuate and apologize for openings for fraud. The great argument on the side of letting things alone is, in fact, all through that, if a law were passed making the action of syndicates public, it would drive all transactions in foreign loans to other countries; but, as the Committee remarks, if these are the only terms on which the profits arising from such loans can be retained in England, they will be too dearly earned at such a price.

It can hardly be imagined that a body constituted in this fashion should be likely to afford real protection to the public, and recent experience has certainly shown that its working is not merely loose and ineffectual, but mischievous. The Committee on Foreign Loans was not authorized to go into any question as to other stocks; and it was only in a by-way that the general character of the Stock Exchange came under investigation. Under these circumstances, though some people may think that enough is already known in order to reform the system, there can be no doubt that it is safer and more satisfactory that action should be preceded by full inquiry and careful consideration. That some such organization as the Stock Exchange is necessary in order to provide a market for stocks, conducted under proper rules and conditions, will be generally admitted. In a certain degree the Exchange is, even as it exists, a useful and valuable institution; and it is difficult to conceive that it can be dispensed with altogether. There can be little question, however, that the present system has serious faults, and that it will have to be revised. In the meantime it may be worth while to mention one or two points on which authoritative opinions have already been expressed. One of these is the principle which was suggested by an experienced stockbroker, Mr. S. R. SCOTT, that in the case of a loan the profits to be allowed to issuing agents should be stated as one of the essential elements of the speculation. "This," he said, "would be the crucial test, as it could be seen whether 'they were reasonable or exorbitant.'" It is, indeed, a point on which information is as much required as with regard to the purchase of land or construction of works. Whether a speculation is likely to pay necessarily depends on the expenditure involved. Mr. SCOTT held that the public ought to be in possession of evidence on such facts as that a loan is only issued to a very small extent, or that it has been issued at "a very enormous profit to contractors, an unreasonable profit." The Select Committee also took a similar view. It recommended that the Stock Exchange Committee, before granting a settling-day, should require the production of a statutory declaration by the special Commissioner, if any, of the contracting Government, and by the contractor or agent for issuing the loan, stating the authority of the borrowing State, the public debt and revenue of the State for the last three years, and, in case of special hypothecation, a full statement of the revenues, lands, forests, public works, or other property upon which the proposed loan is secured, and of prior charges, if any, upon such security; there should also be either an assurance that no part of the proceeds of the loan is to be applied in buying back any of the stock, or a public statement of the amount which the borrowing Government reserves to itself the right to repurchase and cancel; and, further, a statement of the funds out of which the interest is to be met during the next five years. Another suggestion of the Committee was that the clause in the Companies Act of 1867 making false statements or wilful omission in a prospectus a ground for a civil action should apply to all kinds of stock, whether foreign loans or Companies; but, judging from recent experience, this form of swindling in any kind of stock ought to be subject to criminal penalties of a very severe kind. Since the disclosures in the Eupion Gas Company case the Stock Exchange, having been then itself bitten, has made a rule that the statements made by applicants for allotments shall be statutory declarations; and this rule should also be applied to foreign loans. Again, it has been pointed out that some precautions ought to be taken against such disreputable and untrustworthy persons as have in recent years come over to England as agents of foreign Governments, in order to deprive them of the facilities for fraud of which they have been found in some cases to have made large use. The personal composition of the Stock Exchange corporation itself also requires serious attention. It is known that it

has much deteriorated in recent years, as was, indeed, only a too natural result of the practices allowed by the managing Committee.

HEALTH AND TEMPER.

IN one of the South American Republics it is said that Justice looks with peculiar leniency on crimes committed when a certain wind is blowing. It has been decided by the mild wisdom of the Legislature that no man is quite responsible for his own actions while the malignant influence lasts. Maddened by the cold and cutting air, by the dust and powdered straw which fill his mouth and eyes, and by the virulent persistency of the wind, he may rush forth and avenge himself on the first person he meets. The consequences will only be a slight fine, and close imprisonment till the weather shows signs of improvement. These provisions seem almost in advance of what human nature has a right to expect. They tend towards fatalism, and discourage all effort to subdue circumstances to character. But it is perhaps to be wished that, in forming judgments of the temper and conduct of others, people should lean somewhat in the direction of this American mildness. Among the circumstances and conditions which make it difficult, from moment to moment, to preserve that balanced attitude of the completely formed will which is character, health is perhaps the most important. Health influences the temper most nearly; certain physical conditions, not apparent to the observer, are at least as irritating as the worst east wind, and yet the patient's words and actions are judged as severely as if he were before an English, not a Paraguayan jury.

Bad health and good health have obviously a strong influence on the formation of character, and yet it is always impossible to say *a priori* how either will act on any given individual. Thus it seems easy for a large, euphletic, and jolly-looking man to have a good temper. The wind that beats the mountain blows more gently about his large curves. It visits with a sharper inquisition the meagre angles of a lean and physically ill-conditioned person, and it is not surprising if the former is comfortable and happy while the latter is exasperated and peevish. A large man can endure more fatigue before his energy droops to that languid state in which all the wheels of being are slow, and the body and mind resent every sort of contact, everything that forces exertion on them. But the favoured of nature in health are apt to degenerate in character by reason of a physical pride like the "intellectual pride" which preachers speak of, and which, according to one famous liberal theologian, is a purely mythical and imaginary sin. Physical pride is only too real a failing, and causes only too much unhappiness in families. The healthy member, who is a great eater of beef, has merged his imagination and his sympathies in a tyrannical robustness. Though he would be the first to blame the moral Pharisee who should declare that he had never slipped from righteousness, the physical Pharisee is eternally bragging that he never was wearied out. He may think that the hero talked too largely who declared that he did not know what fear was like, but for himself he insists that he does not know what fatigue is like. Thus the result of his natural gifts is a certain hardness and cruelty. He opines that boys should "rough it," and is an advocate of flogging and bullying. The healthy tyrant is all for hardening every one, and he revives the cold-water torture of the theological past for the benefit of his more delicate children. The expression which he uses most frequently is "Nerves, all nonsense; look at me," and then he bores his audience with the recital of some cruelty that he practised or endured in his youth.

It is a question whether it is better for a family to fall into the hands of the healthy or of the nervous and debilitated tyrant. For the latter, bad as has been the influence of his health on his character, some excuse may be made. He does deserve pity for having drifted into that state which the Scotch idiom describes as "all eggshells." A sudden noise, an inopportune interruption, a painful story, affects some people with a physical shock which the robust world knows nothing of. There are moments of languor, apart from actual suffering, in which every sensation is modified anguish. A family which walked in list slippers, which never played games, which possessed no piano, and lived far remote from street cries and railway whistles, would yet be too noisy company for the man or woman who has yielded in the struggle and left character at the mercy of nerves. Where there are such people in a house it is impossible for any one to do anything rightly. The game begins in the morning, when it is discovered that the neighbour's dog or a distant barn-door fowl kept the dear sufferer awake. He comes down late to breakfast and finds breakfast cold, and some one else has read the newspaper before him, and there is talk of a party of pleasure, against which he rages peevishly. Every one, he prophesies, will get wet, will catch cold and die, and really some of the audience may come to think such a fate a fortunate release. The vanquished character, the member of a family, or of a society, who has given up fighting for cheerfulness, and who lets his physical depression have its own way, is not only wretched himself, but a cause of wretchedness to others. People grow up in his baleful shade, as it were, under a mossy upas-tree, and through all their lives retain a trace of his keen sensitiveness to annoyance, and his angry resentment of the pin-pricks of daily existence.

In palliation of this miserable way of taking the events of life must be set of course that always unknown quantity, the actual measure and quality of the physical discomfort which the nervous

goes on to talk of the Double Procession occupying the whole theological horizon of the ninth century, "tearing asunder the Eastern and Western Churches, producing the terrible anathemas of the Athanasian Creed, and precipitating the fall of the empire of Constantinople," we rub our eyes and begin to wonder whether we are reading the deliberate utterances of a professed historian and divine, or the ravings of a compiler of theoretical history out of the Apocalypse. The Dean need not have travelled beyond the popular pages of Milman or Neander to learn that other questions had much more to do with the division of East and West in the ninth century than the dispute about the *Filioque*, which was little more than an *ex post facto* pretext; while every scholar but himself and Mr. Foulkes is aware that the Athanasian Creed was unquestionably composed several centuries before the dispute had arisen, and that its anathemas were just as much "produced by the doctrine" of the *Filioque* as by his own recent lecture at St. Andrews. Meanwhile he might with advantage refresh his memory by reading an article on the *Filioque* in the current number of the *Church Quarterly*, from which he will also learn that the question neither is nor can be "dead and buried" yet.

From the schism of East and West in the ninth century the Dean passes at a bound to another illustration of his thesis in the Gorham controversy, "which in 1850 threatened to rend the Church of England from its summit to its base," and has now completely collapsed. His explanation of the supposed change of faith on that point is eminently characteristic. The whole dispute hinged on the word "regeneration," and yet "it never occurred to either party or to any of the disputants that there was an ambiguity in the word itself," nor did either of them ever dream of attempting "to define or explain what they meant by it." The account of the *Filioque* controversy is startling enough, but this account of the Gorham affair—which must be tolerably fresh in the memory of the lecturer as well as of many of his readers—literally takes away one's breath. That some of the Evangelical party chose to saddle the doctrine of Baptismal regeneration with certain supposed inferences which their opponents unanimously disclaimed is true; but the Dean must have studiously held aloof from the whole contemporary literature of the subject, which was sufficiently copious, if he does not know how euphuistically, persistently, and with almost wearisome iteration, in tract, sermon, pamphlet, leaflet, and laborious treatise, all the High Church spokesmen of the day, from the Bishop of Exeter downwards, took the utmost pains "to define and explain" precisely what they meant, and what they did not mean, by the doctrine. Nor were the Evangelicals of the day less explicit in asserting their rejection of it, not only in the arbitrary sense which some of themselves had ascribed to it, but also in the sense really maintained by its advocates. That the explanation then given has led many of them to change their minds since may be true, as it is indeed generally admitted that the doctrine is much more widely held and taught in the Church of England now than it was before the Gorham case. In that sense only the question may be said to have "collapsed."

We have seen how Dean Stanley illustrates his thesis of "the progressive element in the substance of religion" from the history of the Church universal and of the Church of England, and that his historical illustrations are no less paradoxical than the thesis they are designed to prove. Let us now see how the thesis itself is expounded. Theology, we are told, has gained and may gain immensely from the process, which has produced so vast a change in all other branches of knowledge, "of diving below the surface and discovering the original foundations." The language, as is usual with the writer, is at once grandiloquent and vague, but it is evidently meant to imply that the theology of the past eighteen centuries has failed to penetrate below the surface of things, till in these last days "the spirit of the time, the *Zeitgeist*, has turned the light of his lantern full upon them," in the prophetic person of "Matthew Arnold." All previous theologians were but elegant triflers, and the truth remained hidden, as it is rather oddly put, as well from "Hume and Voltaire," as from "Thomas Aquinas, and Cyril, and Augustine;" nay it was hidden from Hume and Voltaire "because it had been equally unknown" to Aquinas and Cyril and Augustine, which sounds still more enigmatical. Now, however, since "the Ithuriel of modern criticism" already named has dealt a deathblow to "whole fabrics of false doctrine and barbarous phraseology"—Mr. Arnold, it may be remembered, expressly includes under the comprehensive name of *Aberglaube* the Incarnation, Resurrection, and Atonement among other doctrines—the Old and New Testament have acquired a new interest not inferior to that excited by "Homer or Shakespeare or Dante or Scott." From these brilliant triumphs of doctrinal development the lecturer gracefully passes on to "that vexed question of Church government, the relative merits of the Episcopal and Presbyterian systems. Both are excellent in their way, and either may under given circumstances be preferable to the other, just as "a black gown may in certain cases be far superior to a white one, or a white one to a red one." The absurdity, now happily exploded, lay in imagining that either "was exclusively right and essential." Now the Dean is of course quite free himself to regard the distinction as a purely indifferent one, but, unfortunately for his argument, the great majority of Christians—even if for argument's sake we put the Anglican Church out of the question—still persist in regarding the episcopate as "exclusively right and essential" to the Christian Church, while the great majority of Scotch Presbyterians, including, if we are not mistaken

the whole Free Kirk, are equally convinced of the exclusive truth of their own system. It is open to him however, as we have observed already, to maintain that both parties are wrong and that he is right, though that does not much help his argument. But as much cannot be said for his still more venturesome method of treating the next subject introduced, which can from no point of view be regarded as conceivably feasible or consistent. There is an increasing difficulty or incredulity, we are reminded, among the educated and half-educated sections of mankind, as to "the mode of regarding those physical wonders which are called wonders or miracles." The question is allowed to be a "grave" one, but we cannot say much for the gravity of the proposed solution. A trite quotation from St. Augustine to the effect that "we believe the miracles for the sake of the Gospels, not the Gospels for the sake of the miracles," is followed by an equally trite platitude about "external evidence having with most theologians receded to the background, and internal evidence come to the front;" and then the matter is finally disposed of by the irrelevant truism that moral miracles are greater than physical ones. All this is familiar, not to say commonplace, enough, but it leaves the original difficulty precisely where it was before. There may have been a disposition at some periods to dwell too exclusively on the external evidences of revelation, though we should have thought that "most theologians" of mark in every age had fully recognized the force of internal as well as external proof; but let that pass. Whether the Gospels are to be accepted for the sake of the miracles, or the miracles for the sake of the Gospels, it remains equally clear that no rational thinker can accept the Gospels without accepting the miracles which form an integral portion of the narrative. The destructive criticism of Germany, under the guidance of such master minds as Baur and Strauss, has at least rendered one important service to the cause of sound theology no less than of sound sense in demonstrating this. But perhaps it does not much signify whether we accept the letter of the Gospel narrative any more than the truth of the "physical miracles." For we are next told, in the lecturer's usual misty phraseology, that "the essential and supernatural elements of religion are recognized to be those which are moral and spiritual and that" by these alone "it may overcome the world." This may of course mean almost anything, but if it means, as the context appears to require, that what a much abler and more clear-headed writer than Dean Stanley called "the moral elements of Christianity" are alone valuable and destined to survive, we have just two remarks to make upon it. In the first place, Strauss did not and could not prove, what runs entirely counter to such experience as we at present possess, that the moral elements of Christianity would long survive the destruction of the doctrinal basis on which they have hitherto rested; and in the next place, the residuum, if it were preserved, would be something quite different, as Strauss himself is careful to insist, from what is now understood by the Christian Religion—so different that in his latest work he formally dismisses its title to the name.

The Dean, however, whose credulity in his own theories is more than a match for "the incredulity of the educated section of mankind," is confident that "in the supremacy of the moral and spiritual elements alone," whatever they are, "lies the hope of the future." To our less sanguine apprehension the prospect does not look an encouraging one. Nor are we greatly consoled by the bewildering suggestion that "the true faith" has been chiefly debilitated in the past, not to its supposed champions, but to "the so-called heretic or infidel," and notably to "the aspirations of the excommunicated Spinoza," to whom "was vouchsafed the clearest glimpse into the nature of the Deity." This is not the place to enter on a criticism of Spinoza's system, but it is certain that clearness has not usually been considered one of its merits. Some have pronounced him a pantheist, others an atheist. As Schleiermacher words it, "He denied the personal existence or the living personality of God, and endeavoured to substitute for the notion of the Godhead the empty idea of the Infinite." Nor is our "glimpse into the nature of the Deity" rendered much clearer by the portentous announcement that "it is not the reconciliation of theology and science that is needed, but the recognition that they are one and indivisible." True though it be, to quote the Dean's paraphrase of a familiar line of Milton, that "whatever enlarges our ideas of nature enlarges our ideas of God," it does not therefore follow that revelation and science—by which is here meant physical science—are one and the same thing, though philosophers and theologians, who are quaintly distinguished as the "unregistered" and the "registered citizens of the heavenly Jerusalem," have too often failed to appreciate this inherent unity. We have no space to dwell on the lecturer's glowing eulogium on "the principle of a national Establishment," the great merit of which is not of course that the State is benefited by the Church, but that the Church is unspeakably "elevated and enlarged by contact, however slight, with so magnificent and divine an ordinance as the national Commonwealth." Nor can we stay to notice his somewhat unexpected panegyric of "that venerable document 'the Westminster Confession, which may or may not be vastly superior to the Thirty-nine Articles, but would not exactly suggest to ordinary minds the closing admonition—we are not responsible for a formula which may strike some of our readers as at once shallow and irreverent—"to be broad with the breadth of the charity of the Almighty God." In any other writer than Dean Stanley it might cause a sensation of surprise to find the typical example of this breadth and charity selected in the person of "John Knox,

the reformer," who condemned toleration as "opening the flood-gates of heresy," fiercely denounced the permission of "the idolatry of the mass" in the Queen's private Chapel at Holyrood, and hounded on the rabble to the destruction of some of the noblest monuments of art and piety in Scotland with the brutal jest, "Pull down the rookeries, and the rooks will fly." But on these and other eccentricities we cannot linger here. One word in conclusion. Miss Martineau has left on record her conviction that Christianity is "the last of the mythologies, about to vanish before the flood of a brighter light," and that "the time cannot be far distant when throughout the civilized world theology must go out before the light of philosophy." We have no doubt ourselves that she was mistaken, but there are unfortunately many, both of the "educated" and "half-educated section of mankind," who share her views. It would be interesting to hear their opinion of Dean Stanley's short and easy method of dealing with the problem of the increasing divergence between intelligence and faith. Nor should we be greatly surprised to learn that it reminded them, as it has certainly reminded us, of nothing so much as of Dame Partridge and her mop.

NEWSPAPER DEVELOPMENTS.

JUST at present, for some reason or other, there seems to be a remarkable outbreak of enterprise in journalism. Scarcely a week passes without some new paper being started; and the club tables are covered with a distracting litter, to the great embarrassment of the old stagers who imagine that they are bound to read, or doze over, everything put before them, and who find that now even a superficial rummage occupies, not merely a leisure hour or so, but the best part of a day. Where this is to end it is hard to say, for the rush still goes on; but it may be assumed that experiments of the kind would not be likely to be continued if readers were not found. It may be said also that the new-comers appeal to a variety of tastes, and show a certain degree of originality in their departure from conventional usages. Some trust to illustrations, others to fiction administered in homœopathic doses; not only the past but the future has its chronicle; the spirit-world is represented by mediums in the press as well as in other ways; and there is another class of papers whose stock of information as to earthly matters would seem to be of an equally visionary and artificial character, though, to do them justice, they certainly make no pretensions to celestial agency. No doubt there are many more readers of all kinds than there used to be, and everybody will now be able to choose a periodical to suit his peculiar taste. Enterprise, however, is not confined to the miscellaneous offspring of the day; for there are symptoms that even established organs are coming out in new ways. Indeed the leading newspaper has lately set a bold example in this respect, which we may expect to see followed up, and perhaps outdone, by imitative competitors. The managers of the *Times* have apparently felt that in journalism, as in everything else, there is ample scope for development; that, as time goes on, there are fresh opportunities of extended usefulness, and that in various ways newspapers require to be from time to time adapted to the wants of the period. Thus "the journal of the City," as it is called abroad, now appeals to a largely extended circulation in the form of a cheap weekly reprint, in addition to its regular morning issue. This, of course, is not exactly a novel plan, though it may be doubted how far a newspaper aspiring to a high place as a political guide can at the same time successfully meet the tastes and views of two entirely different classes of readers; and also whether an attempt at a universal circulation may not possibly affect the rank and reputation of the publication in the position which it has hitherto occupied. But it is not only in this way that the *Times* is exerting itself to meet public requirements. It has also, it would appear, come to the conclusion that journalism by itself offers but a cramped and narrow sphere for capital and enterprise, and that there are other services which may be rendered by such an agency to the world. The other day the *Times* published the following announcement, which may have caused some surprise, not without a thrill of delighted expectation, to many persons:—"ADDRESS AND INQUIRY OFFICE.—To meet a want felt by advertisers for a central office at which answers and applications can be received in reply to advertisements, as well as at which trade catalogues and price lists, prospectuses, reports, circulars, also conditions and particulars of property on sale, &c., may be obtained, an office has been opened contiguous to the Advertisement Department of the *Times*, where such accommodation may be had on payment of a small fee. A file of the *Times* is kept for reference."

Whether the originators of this singular project will find themselves able to combine their new undertaking with the exigencies of a high-class daily newspaper is a question which must be determined by experience. But, at first sight, it is certainly rather startling. It may be pleaded perhaps that it is only a development of species on the principle of natural selection. Once upon a time newspapers existed in a primitive and elementary form; they were papers of news, and were composed exclusively of such matter. Gradually advertisements crept in, and now they monopolize the greater part of the daily sheets, while the news is apparently sinking into a subordinate place, and becoming a mere adjunct to advertising. In short, the old relations to each other of the body of the paper and the supplement are

reversed, the news having become a mere supplement to the advertisements. Advertisements alone would probably secure a large circulation; and the news is thrown in only to help the sale. This fact—that advertising now forms an important, we may almost say the predominant, element in the constitution of the newspaper of the day—has no doubt suggested that advertising ought to be cultivated to the fullest extent, and that, if the accommodation at present afforded to the advertising world by the columns of the papers leaves anything still wanting, it must be supplied. The notice in the *Times* is not very explicit in its wording; but, as far as we can gather from it, the design is to establish, in connexion with a great medium for advertisements, a central rendezvous where all classes of advertisers and those to whom they appeal may be brought together. It is not indeed expressly stated that arrangements have been made for personal interviews; but it is obvious that this is an indispensable feature of the scheme, if it is to be practically carried out. A Central Office at which only written answers and applications in regard to advertisements are received is scarcely necessary in these days of abundant postal facilities. What is wanted is a meeting-place where the various parties may see each other and settle terms; and this, we fancy, either is, or will be, provided at Printing House Square, if this wonderful scheme is to have justice done to it. Again, as far as trade catalogues, price lists, prospectuses, circulars, conditions and particulars of property on sale, and so on, are concerned, people could easily have them sent to their own addresses, so that they might consider them at leisure, and indeed many complaints are heard of the excessive supply. The only real use, therefore, of such an office as is projected would be to give advertisers an opportunity of showing samples of their goods to intending customers. If, therefore, the plan is to be logically and thoroughly carried out, Printing House Square may be expected before long to present the lively appearance of a great metropolitan bazaar. Ladies, we suppose, will make their appointments to negotiate those troublesome questions which arise with cooks, housemaids, footmen, pages, and other servants; masters will look out for valets, grooms, and perhaps horses; shopkeepers will display their wares; and thus, instead of the comparatively blank and vague announcements of the advertisement sheet, the classes in question will be brought into direct personal relations, and will be enabled to settle their bargains offhand.

There can be no doubt that this is a grand idea, and it shows that, so far from the *Times*, as some people have been lately hinting, not keeping pace with the age, it is really going quite ahead of it. At present of course this system of accommodation is only in its infancy; and there will be ample room for all sorts of developments as it goes on. Indeed the same process of extension has been observed in other kinds of business. There is understood to be somewhere in the West of London a draper, as he would formerly have been called, at whose range of warehouses almost every commodity which a human being can want may at once be obtained, from provisions, clothes, cradles, coffins, tables, chairs, to the innumerable nick-nacks of domestic luxury or caprice. A schoolboy can be rigged out from top to toe in the twinkling of an eye, or an Indian outfit may be obtained while the cab waits at the door. There is also an extensive refreshment department where whole families can be supplied with every description of food, and which is used by many persons, we believe, as, in these awkward times, a convenient substitute for household service. It is to be hoped that this feature will not be overlooked by the *Times*, for nothing is more exhausting both to employers and servants than discussions about qualifications and wages; and, besides, the refreshment business is said to be a very profitable one, and would help to eke out its returns. It is this concentration of universal supply which is nowadays becoming the great principle of trade; and there is no reason why newspaper proprietors should not throw open their premises as well as their columns for the accommodation of the public.

There would seem to be nothing which is more wanted just now by a society whose curiosity is constantly becoming more intense and imperative than a medium of communication through which information could be procured on all sorts of subjects by just asking for it. Hitherto the only resource has been to advertise, or to send a letter to the editor of some paper which publishes answers to correspondents. An eminent ex-statesman has, however, lately set up a cheap oracle of this kind; and it might be worth the consideration of the authorities of the *Times*, while they are in their present advanced and philanthropic mood, whether they might not turn their varied sources of information into a channel of this kind. Mr. Gladstone might be provided with a private room, having a slit in the door, through which inquiries could be passed, and cards in reply showered out. This would also be a good provision for Mr. Gladstone himself, who, having retired from statesmanship and worked himself out in pamphleteering, must now want some new occupation; and it would certainly enable him to economize in postcards. Probably the national revenue might suffer, but this would be a small price to pay for providing a great man out of work with a vocation to his taste. Other authorities might also be consulted on special subjects. There are, for instance, a great many people who are anxious to obtain good advice as to investments, information as to wills, missing heirs, the character of the parties in a projected marriage, and the like; and no doubt there would be a great rush to any office which was open daily for supplying this sort of information. Here, too, those blighted beings who at present have to utter their moanings and confidences before

the public in the second columns of the *Times* might meet for privileged communion with sustaining refreshments. In short, there is no end to the uses to which this grand and original idea may ultimately be put in order to add to the happiness and comfort of the world; and in future years it will no doubt be wondered how the world could possibly have got on before it was thought of. There remains, however, the question which we touched on at the beginning, as to whether such a business as that which is involved in the strictly newspaper part of the *Times'* mission is not enough to satisfy the energy of even the most enterprising and ambitious proprietors. After all, there are other ways in which this accommodation which the great journal is so benevolently bent on providing can be had, and many people may be disposed to think that, instead of wasting its time and force in doubtful experiments, it would be wiser to devote itself to doing its natural work in the best way—as, for instance, curbing the tendency of its Special Correspondents to write empty leading articles instead of news, and also holding a little more in hand the team of wild contributors at home, who seem to be always distracting the coachman by bolting up different alleys.

"BULGARIANS AND TURKS."

IT is always amusing, though sometimes half provoking, when a man who has just turned over two or three ordinary books, and has lighted on a well-known fact or statement for the first time, at once rushes to hurl his discovery at the head of people who have been familiar with it all their days. There is a story told—we are not sure whether it is not in Izaak Walton—of a zealous spirit of this kind in the days of the British Solomon. Dr. Kilby, Rector of Lincoln College and one of the translators of the Bible, was staying on a Sunday at a friend's house in the country. He went to church, and there a sprightly young curate discoursed in his sermon on a certain text, and gave three reasons why it ought to have been translated in another way from that in which it had been rendered in the then new translation. After the sermon the curate came to dine with Dr. Kilby's host, and then Dr. Kilby said something to him to this effect:—"When we translated that passage, we carefully thought over all your three reasons, and we found thirteen stronger reasons why it should be translated the other way." This exactly hits off the frame of mind of which we speak. The fancied discoverer is so pleased with his newly found three reasons that he gives himself no time to look whether there may not be thirteen reasons on the other side. Or perhaps, after all, his fact may not in itself be wrongly stated, only he so eagerly seizes on it in the zeal of discovery that he does not stop to look at other facts which stand round about it, and to see in what relation it stands to those other facts, and how far it and they modify one another. Then, like the Philistine chief who, being armed with a new sword, thought to have slain David, he at once goes forth with his new fact to expose the errors of some one who had set out and weighed all the facts, all the reasons, the thirteen as well as the three, a good many times before the new discoverer was born. So it is with a correspondent of the *Pull Mall Gazette* who signs himself "Sancho," and writes from "Barataria." He thinks that he has just found out something about the Bulgarians which must be quite new to everybody, as it is plainly quite new to himself. As we have been lately saying something about the Bulgarians and the other nations in those parts, we naturally go to listen and to find out what our new instructor has to tell us. We measure him at once by his use of epithets; he is great alike in epithets of praise and in epithets of abuse. Now there is no surer sign of a novice than when he begins by patting people on the back who have long since got past the stage of being patted on the back. Writers of great books and doers of great deeds do not need epithets, unless the epithets be something specially distinctive, something hitting off some special characteristic of one as compared with another. A professed critic of English poets might give distinctive and characteristic epithets to Shakespeare and to Milton; but there is no need for one who speaks of them casually to explain that they were both of them great poets. It comes under the same head as the story of the orator who elaborately praised Hercules, and got for answer "Quis vituperavit?" So with those who know anything about Turks, Bulgarians, Greeks, and other nations in that part of the world, there is no need to pat Mr. Finlay on the back. They do not need to be told that he is "accurate and critical," that his *Greece under the Romans* is "invaluable," or that he works out the later periods of Byzantine history "with his usual painstaking accuracy." Those who have had their Finlay in their hands since the first edition of the first volume was new do not need to have their instructor complimented like a youth who has written a clever prize-essay; they know both his strength and his weakness far too well for that. Nor do they need to be told that D'Herbelot is "learned, though somewhat antiquated"; or, again, that he is "erudite." To tell the editor of the paper to which you write that his articles are "excellent and compendious" is of course no more than civil, perhaps no more than prudent; it is like the present which you take in your hand when you visit an Eastern king. If "Sancho" is good enough to pronounce our present remarks to be "excellent and compendious," we, as we do not feel ourselves to be either a David or a Hercules, a Kilby, a Finlay, or a D'Herbelot, will promise to take the compliment kindly.

"Sancho" objects to a definition which the *Pull Mall Gazette* had given of a Bulgarian. The definition was "a sort of Slavonian; or, rather, a sort of Finn Slavonian." We do not remember either the context or the object of the definition; but the definition by itself, though oddly put, is not such a very bad one. It does in a kind of way express the facts of the case. A modern Bulgarian is a Slave, with whatever difference from other Slaves may be supposed to have come of his having been a long time ago brought under certain Finnish influences. If any one chooses to express this by calling him a Finn Slavonian, we do not quarrel with the name. We dare say we have used the parallel of our own history before, but we may make things clearer by using it again. The modern Bulgarians are a Slavonic people, modified, so far as they were modified, by a Finnish conquest many ages back, just as the English are a Low-Dutch people modified, and much more modified than the Bulgarians are, by a Romance conquest not so many ages back. The modern use of the words Bulgarian and Bulgarian are exactly the same as if England were called Normandy and Englishmen Normans. It is very much as when the Gaul learned to give himself and his country the name of his Frankish conqueror. There are differences in each of the three cases, and those differences and their causes are just as instructive as the points of likeness; but a general analogy runs through the three. In all three cases a smaller number of conquerors got lost in the greater mass of their subjects and neighbours. In all three cases the conquerors adopted while they modified the language of the conquered. In two out of the three cases the conquered adopted the names of the conquerors. The phrase, "a sort of Finn Slavonian," it is what it is meant to express, is queer, but not inaccurate. It would sound very queer to call an Englishman "a sort of Romance Low-Dutchman," or to call a Frenchman "a sort of High-Dutch Celt," but the phrases, however queer, would be at least patient of an accurate meaning.

But Sancho of Barataria is not satisfied with the definition of a Bulgarian given by the *Pull Mall Gazette*. He asks to be "permitted to remark" that that definition, if not an erroneous, is at least a very questionable statement. And his correction amounts to this, "for Finn" read "Turk." He then quotes his Finlay and his D'Herbelot to prove that the Bulgarians were Turks. He also tells us that he is "compelled to pass over much collateral testimony, both of books and of observation, his own included." This last form of corroborative testimony is imposing; but as long as Sancho remains anonymous we cannot judge of the value of this testimony, as none of our books tell us of any Bulgarian colony in Barataria or Nephelokokkigia either. He favours us with a little summary of Bulgarian history out of Finlay, and quotes Finlay as speaking of them as "a nation of Hunnish or Turkish race," an expression which of itself shows that Finlay did not mean to commit himself to any minute ethnological theory. He might have added that, though Professor Max Müller counts the original Bulgarians for Finns, yet Dr. Prichard counted them for Turks; and, if he ever stooped to read so thin a book, he might even have found something to the same effect in Mr. Freeman's *History and Conquest of the Saracens*. We will not ask whether he has gone through all that may be found about Bulgarians in Zeus, Schularik, and Jirek. And let us add that Jirek, though he doubtless writes to make a case for Bulgarian nationality as against Ottoman and Greek alike, wrote before the immediate troubles of the last two years began. The conclusion to which any one who really understands the matter will come is that, whether the original Bulgarians were Huns, Turks, or Finns, is a matter which may be left to those who are specially curious in Turanian ethnology—that it is of no importance to the modern politician, that it is of very little importance to the general historian. Most modern scholars now rule the old Bulgarians to have been Finns, as they rule the Magyars, the Turks of the Byzantine writers, to have been Finns also. Call them Huns, Turks, or Finns, the lesson to be drawn from their history is exactly the same. In any case, whether a Turanian ethnologist would or would not allow that they had any direct kindred with the Ottoman Turk, they had a strong point of negative likeness to him. Bulgarians and Magyars alike were utterly alien to the language, the religion, the general system of Europe, that system which was formed by bringing the Teuton and the Slave under Roman influences. Yet both the Bulgarian and the Magyar did, in different ways and in different degrees, become adopted members of that system, while the Ottoman Turk never did. Why the Bulgarian and the Magyar could do so while the Ottoman Turk could not, admits of a very easy answer, which we leave "Sancho" to guess; but the nearer he can show the kindred of the Bulgarian and the Ottoman to have been, the more instructive is the one great point of difference between them. Whether the old Bulgarians were Finns or Turks, the modern Bulgarians are Slaves, just as though the old Franks were High-Germans, the modern French are Celts. But if "Sancho" could prove the modern Bulgarians to be the purest Turks in the world, he would only make the case stronger against himself. He would show that the cause which separated the Bulgarian Turk from the Ottoman Turk, which allowed the one to become European and Christian, but which did not allow the other to do so, was something which had nothing to do with race at all. And this is exactly the point on which those whom he attacks insist; the nearer he can prove the ethnical relation of the Ottoman and the Bulgarian to be, the better for their argument and the worse for his.

"Sancho" goes on, "But the inevitable result of inquiry is, that the Bulgarian of our day, in spite of occasional and casual admixture

in race, is in the main and by direct descent a genuine Turk." Well and good; so are a very large part of mankind. The Turkish race, as one who writes about them ought to know, is one of the greatest and most widely spread in the world. It takes in nations whose manners and customs concern only Mr. Tylor and not any inquirer into more modern matters. It takes in nations to whom the name of Christianity and that of Islam are alike unknown. But "Sancho" plainly never heard of any Turks but the Ottoman Turks; he is in the same state of mind as one who, if he should find any of the endless forms of the name *Dutch* applied to any people, should at once rule them to be subjects of the Count of Holland. He proves to his own satisfaction that the present Bulgarians are Turks, then, with a splendid burst of sarcasm, they must therefore be—all that any anti-Ottoman speaker has ever called the Ottoman Turks. Alas for the poor harmless Turks at the mouth of the Lena, who are more likely to be looking for the teeth of a fossil elephant than to be troubling themselves about what any one is doing or suffering by the Balkan. No one meant to say a word against them. Yet, according to "Sancho," every hard word that has been used of the Ottomans must apply to them also. It is exactly as if any expressions of wrath which might have been used about the doings of the men of the Seven United Provinces in Ambogna or elsewhere had been taken, either seriously or by way of eloquent sarcasm, to be applied to every man who called himself *Deutsch*.

All this is meant for political argument, for an argument which is specially addressed to "thinking men," to those who "have some pretension to statesmanship." Any defender of Ottoman rule who ever thinks, or has any pretension to statesmanship, will hardly welcome his ally. But what "Sancho" goes on to say is perfectly true:—

No one with the mere pretension to statesmanship but is fully aware—though it may at times not seem otherwise—that historical (I had almost said prehistorical) questions like this of origin and race are where administration is concerned, idle; where national justice, misleading; where policy and interest, dangerous; that nationality apart from patriotism, and religious enthusiasm apart from rule and right, are the very *ignes fatui* so often held out of our time by knaves, to be followed by fools.

The language is a little strong; but the agony is well piled, if one could only see against whom all this is aimed. Nobody quarrels with the Turk simply because he belongs to the great Turkish race. Few, we hope, besides Sancho think that the Ottomans make up the whole of the Turkish race, or that the strongest things which can be said against the Ottomans tell against the Turkish race in general. A man may speak of "the Turks" when he means only the Ottomans, because the chances are that both hearer and speaker are at the moment thinking of no Turks but the Ottomans. Let him prove the Bulgarian to be a pure Turk, as pure as the Turks of the Lena—that is, a great deal purer than the Ottomans, many of whom are in blood not Turks at all. Pre-historic questions like this are certainly idle, except as matters of pure scientific inquiry. The friend of the Bulgarian is no more bound to denounce him if he is proved to be a Turk than if he is proved to be Fin, Hun, or Slave. Nor is he bound to withdraw anything that he has said against the Ottoman Turk. The historical lesson, the historical facts of the case, the practical inferences from them, remain the same either way. The state of mind of "Sancho" with regard to Turks and Bulgarians would seem to be much on a level with that of Mr. J. S. W. S. Erle Drax, who seems to be unluckily the owner of Caesar's Camp at Wimbledon. Mr. Drax thinks it proves something to argue in the *Times* of Tuesday that "It is well known that Caesar remained in this country but a very short time, and consequently could not have erected these earthworks over our country." Caesar's Camp, he tells us, "really is only a Celtic tumulus." Mr. Drax's notions of a tumulus seem as odd as "Sancho's" notion of a Turk, and both seem to have the same dangerous trick of scattering ethical epithets about at random. Mr. Drax thinks that earthworks "cannot interest the public at large except such parties as the promoters of the Bill, who have a craze on the subject." And really the question whether the Bulgarians were Turks or Fins can interest nobody but such "parties" as scientific ethnologists, "parties" whom Mr. Drax would doubtless set down as having a craze on the subject. We are sure of one thing, that such "parties" as Mr. Drax and "Sancho" had better leave off their craze of writing about either *Cæsars* or *Turks*. *Cæsars* and *Turks* alike belong to the dangerous classes, and such "parties" as we have just now to deal with may haply cut their fingers if they meddle with them.

SUBURBAN CLUBS.

WE can hardly say that the club system is still in its infancy; but, so far as we may judge from its swift development, it is a long way from having arrived at maturity. A hundred years ago men of eminence or position were content to assemble themselves together for the mere sake of good-fellowship. Creature comforts were a matter of secondary consideration; the expenditure was limited by rule to a trifle; or, if the members did indulge in venerable vintages out of cobwebbed bottles, as likely as not they drank them in the sandied parlour of some dingy public-house, sitting round a liquor-stained table on the most unsatisfactory of stiff-backed chairs. Possibly the feast of reason was more generously spread in those days, and the flow of soul may have been freer and more exhilarating. At all events, at present nothing seems to suffice us short of the utmost gratification of the senses within the

possible limits of our means. All over the West-end of London pretentious new establishments are perpetually opening their doors, and emulously puffing their attractions by advertisement. The net cast by the enterprising "proprietor" is meant to catch all classes in its meshes. A peer or two, a superannuated general officer or so, with possibly an unsophisticated Church dignitary or a colonial bishop, do duty as decoy birds on the motley committee, and the ballot to begin with is something less than a matter of form, since agents are actively touting for recruits at the corners of the streets and in public places of amusement. In the newly-decorated house there is a good deal of substantial comfort; there is a comparative profusion of plate and clean linen in the coffee-room; there is a supply of papers, which, however, are considerably less in request than the plates and glasses, to say nothing of the billiard cues; and, above all, there is the sense of exclusiveness, which is subtly flattering to the youth who is aspiring to become a man about town. Perhaps there is a touch of obtrusiveness in the attentions of the wine butler, who is over-pressing with his recommendations of wines on the list, seeing that he receives a percentage on sales from the cellar. But, on the whole, the enterprising promoter deserves and receives the gratitude of his constituents. Sometimes his enterprise succeeds, laying the foundation of a flourishing society which may have become a name and an institution in the next generation. More frequently it is to be feared that he comes to grief before the first suits of liveries on his laces have been replaced; and the members find themselves one fine morning "with the key of the street," just as they had been habituating themselves to unfamiliar comforts. But, for one door of the kind that is closed, there are several others ready to open; and nowadays no one who has the means of paying a moderate annual subscription need snatch a dismal breakfast in the room he slept in, nor choose in the evening between the loneliness of his lodgings and a round of wearisome dissipation out of doors. There are clubs everywhere, and for almost all classes. There are clubs in the City, where men entertain magnificently at luncheon, and can at least make sure that the sherry is decent, if they like to indulge in it at unseasonable hours; although these business clubs, as we may well imagine, must be the abomination of desolation in the evening, when the rush of business has retired. There are clubs, as we understand, springing up in quarters of Western London a long way from Pall Mall, which offer a snug and unpretending retreat to a society of gentlemen in the immediate neighbourhood. There are clubs which rest their claims to patronage on their bedroom accommodation—a very excellent idea indeed, and one which we sincerely wish may be further developed. But all this variety of newfangled establishments must have told severely on certain vested interests; and the system that has come as a blessing to the many must have fallen like a blight upon not a few. Ask the proprietors of certain old-fashioned West-End houses, famous for their port and beefsteaks, or their Welsh mutton and Madeira, from the days of the Prince Regent downwards, what their opinion is of this new state of affairs. Or consult the landlords of certain time-honoured taverns in the neighbourhood of the Temple, whose signs have been household words in the Inns of Court. We suspect they will express themselves in language as eloquently decided as that of the fashionable grocer or haberdasher, should you ask him about the Co-operative Stores. There are still plenty of people who take their meals abroad with publicans and restaurateurs—probably indeed there are far more of them than formerly. But they are our joyous friends from the country who take a run up for a few days among the sights of the metropolis; and they are attracted chiefly by those sumptuous new restaurants that flaunt their attractions in our leading thoroughfares. The stranger who comes for excitement likes to live in a crowd; the rattle of hundreds of knives and forks, not to speak of the orchestra that is occasionally provided, makes merry music to the ears; and then he generally gets a fair *table-d'hôte* repast for a very reasonable sum. But these lively birds of passage who flutter about in flocks do not find their way by instinct round the corner or down the darkened passage. And the old patrons, whether from town or country, who have a family acquaintance with the specialities of the house, and address the waiters by their Christian names, come more and more rarely to draw their legs under the polished mahogany, or to smack their lips in anticipation over items in the tempting wine-list. But we should feel a deeper sympathy with those victims of growing refinement were it not that they have had ample opportunities in the past, which they have doubtless improved, of making provision against reverses of fortune.

Hitherto, however, the promoters of clubs have been content to confine their operations to the capital, where the struggle for existence is necessarily sharp, and everybody who hopes to make his fortune by the public must be prepared for innovations and exposed to reverses. Now they propose pushing into the country, and, considering the varied and tempting field that is open to judicious speculation, it is impossible to say where they may stop. At all events the prospect must be somewhat disquieting to shareholders in certain far-famed suburban establishments; while to the landlords of many a smaller though widely-renowned hostelry in the towns and villages on the banks of the Thames a prospectus which we have lately seen sounds a formidable note of alarm. We know nothing of the chances of the new undertaking, and its success must entirely depend on the manner in which it is conducted. But the idea seems a good one; so much so that it is a matter of surprise that it has not been experimented.

upon long before. The clubs in town have been gradually straying up Western Piccadilly, and members of the more venerable establishments in Pall Mall and St. James's Street have looked enviously up at the balconies and windows commanding the cool foliage of the Park in the sultrier weeks of the season. But here, to all intents and purposes, you have a luxurious town-mansion removed bodily to an enchanting bit of river scenery within convenient reach by rail or road. Its resources are to supply both dressing-rooms and bedrooms, and we presume you may attire yourself as you please without much care for appearances. You may revel in all the ease of a racquet dress, or in a loose-fitting suit of flimsy boating trowsers, when the thermometer is tending to 80° in the shade, and your friends in town are simmering in frock-coats. You may have no idea of racquet-playing, and may have never stretched to an oar; but, all the same, you find local excuses for mounting that sensible masquerade, since the club has its boat-house and boating fleet, with a range of racquet courts at the disposition of the members. There are to be grounds for cricket and archery, as for polo, la crosse, and lawn tennis; nor need anybody turn to stare as you pass if you should wear the hat and dust-coloured overcoat of the dragsman, or the cutaway and tight-sitting small-clothes that proclaim the patron of the Turf. For there are to be ample additions made to the commodious stabling on the premises, for the accommodation both of members of the Four-in-Hand and Coaching Clubs, as well as for the less ambitious gentlemen who will rattle down in phaetons and T-carts. Nor will Eve be denied admission to this earthly paradise. Subject to carefully-considered regulations, each gentleman will be permitted to introduce a couple of ladies; so that fancy disports itself in a swift-shifting panorama of Watteau-like scenes, where flirtation goes briskly forward at croquet-parties and *al fresco* kottledrums. Thus it will be seen that the inducements to subscribers are manifold, appealing alike to the lady's man and to the inveterate celibate. For so many guineas down and half as much per annum you may become the possessor of a perpetual pass to the enchanted park and gardens, where art has long been doing its best to make the most of great natural beauties.

Should such a club be fortunate enough to become the fashion, we may be sure that the fashion will be extensively followed. Englishmen, as a rule, delight in the country; and, in spite of the pleasures of a London season, confinement in a city goes against the grain with them. Yet comparatively few have the force of character or the comfortable reliance on their own resources which would enable them to make a short dash into the country with any reasonable prospect of being happy there. It is rather a serious matter for a gentleman with a limited purse to make up a party for the "Star and Garter," where fashion compels him to be choicer about his food and curious in his wines. And, although his imagination may be essentially prosaic, yet it exaggerates the horrors of a sojourn in an out-of-the-way rustic inn, where the leaden-footed hours go by so heavily in the long loneliness of a depressing evening. The notion of a little variety would be another thing altogether, if he had only to change the scene of his ordinary town pleasures, with light, and elbow room, and fresh air thrown in. For, though no passionate admirer of nature, he is not altogether insensible to her charms; and these charms are indefinitely heightened to him when he enjoys them in congenial company. Away in the suburban club which would be the *succursale* of his town quarters, he would still find himself among his friends. A hard day's exercise on the river or in the cricket-field would be followed by a bath and a complete change of toilet in his snug bedroom. The social dinner would be spread by the open window, looking out on the lawn overshadowed by trees and enlivened by blooming flower-beds. The serving would be superintended by a good cook; but the prices of the dishes and wines should be reasonable, and nothing need be ordered for the good of the house. Afterwards coffee and cigars out of doors; to be followed by a quiet rubber or friendly pool. For ourselves, we can conceive nothing more agreeable, if the Committees make their arrangements judiciously. It would of course be necessary to prevent slippered and shooting-coated ease from degenerating into dissipation and orgies, and to see that the free introduction of the fair sex should cause no anxieties to liberal-minded chaperons. They should also set their faces, from the start, against anything like heavy play, which might prove a snare to the frequenters of those rural places of retirement, if *emui* held a candle to the spirit of gambling. For ourselves, we have many pleasant associations with suburban and river-side inns, and we should be sorry to think that they might suffer from this new form of competition. Of that, however, there is little fear. The class of men who will be the chief supporters of clubs in the suburban country are those who but seldom visit it at present; and, if anything, the habit of making dashes out of town would be likely to be popularized by the present movement, should it be fairly successful.

THE ANGLO-FRENCH COMMERCIAL NEGOTIATIONS.

THE appointment of the Commissioners who are to negotiate with France a renewal of the Commercial Treaty of 1860, and the notification which appeared on Monday last that all representations from persons interested in the French trade should be addressed to the Secretary of the Commission in the course of

the present week, remind us that the actual work of revision is about to begin without delay. The result will be awaited with much interest, for it will determine for many years to come the principles that are to govern European international trade. It is true indeed that France no longer occupies the paramount place in the world's estimation which she held in 1860. The lightest phrases of her ruler are not now analysed in the hope of detecting in them an intimation of the future course of events. Nor are his acts humbly copied by admiring satellites. Yet still, though the prestige of France is dimmed, and her influence lessened, her example has great weight with the other nations of Europe. More especially is this the case in commercial matters. The recuperative energy and unsuspected wealth of which she has given evidence since the war have impressed all observers with a higher idea of her industrial capacity; and yet her eminence as a manufacturing community is not such as to lead contemporaries to regard her policy as a warning rather than an instruction. The industrial and manufacturing superiority of our own country is so universally admitted that other nations assume as a matter of course that the *regime* which suits us will be inapplicable to themselves. Hence it is that our Free-trade legislation has had such timid imitators. But France, rich and full of resources though she be, is yet not beyond the reach of competition in manufactures. She is in fact just sufficiently advanced to put rivals on their mettle, yet so much behind England as to make her case comparable with a crowd of others. The decisions, therefore, to which France may come cannot fail to exercise an immense influence on contemporary opinion throughout Europe. And the French Government, it must be admitted, has fully recognized the importance of the negotiations into which it is about to enter, and has taken great pains to qualify itself for conducting them with success. About three years ago the Minister of Agriculture and Commerce of the day addressed a Circular to the various Chambers of Commerce and Agricultural Associations throughout the country, in which he invited their opinion regarding the various points that would arise in the revision of the treaty. The answer of the great majority was decidedly favourable to the renewal of existing treaties. In spite of the political objection that engagements of the kind deprive a country of a portion of its sovereignty—or rather, perhaps we should say, because of the service rendered by the treaties in preventing M. Thiers from returning to Protection—the Chambers, almost with unanimity, pronounced in favour of renewal. The great majority also declared for a further reduction of duties. Some few used language which would not be out of place in the mouths of genuine free-traders. But generally the representatives of the business communities of France were content to ask for a further advance in the direction taken by the Treaty of 1860. The experience of fifteen years had convinced all who were open to conviction that the freer commercial intercourse permitted in 1860 had been of incalculable benefit to France. On this point, indeed, the evidence is irresistible. From the Statistical Abstract for the principal foreign countries, published by the Board of Trade, we find, for example, that the imports into France amounted in 1860 to £82,184,000; in 1874 they had risen to 317,208,000, an increase of 74 per cent. In these fourteen years occurred the war, the Commune, the payment of the five milliards, and the loss of Alsace-Lorraine; yet, in spite of military disaster, financial embarrassment, increased taxation, and stationary population, the people of France were able to buy to this enormous extent more of the necessities and comforts of life, and more also of the raw materials of manufacture and of the instruments of industry. Again, in 1860 the exports of all kinds were valued at 216,584,000; in 1874 they had risen to 336,128,000, being an increase of 55 per cent. The increase of the imports, it will be noticed, has been in a much higher proportion than that of the exports, and this fact, of course, has not been missed by the protectionists. We need not stop here to inquire in what branch of the imports the increase has been greatest, or how far the exports may have risen during the last two years, or to what extent the increase of imports is due to the cession of Alsace-Lorraine, the payment of the indemnity, and the diminished investment in foreign securities. Even if we admit that the imports have been exceptionally stimulated by the treaty, the advantage to France is not the less manifest. Clearly we must assume that trade exists not to supply the wants of the public, but to enrich the suppliers, if we are to hold that an increase of imports is a matter to be deplored. The more plentiful supply of the public wants is palpably a matter for congratulation, unless the community is riotously wasting its substance. But even in 1874 the declared value of the exports from France exceeded the actual value of the imports by nearly nineteen millions sterling. In our own case, as everybody knows, the imports enormously exceed the declared value of the exports, yet even protectionists do not allege that England is on the road to ruin.

When the opinions of the various local representatives of agriculture and trade had been received, the advice of the Superior Council of Commerce was next asked. The question specially referred to the Council was as to the principles on which ought to be framed the general tariff which is to serve as a basis for the negotiation of the new treaties. France, as our readers may be aware, has no commercial treaties with certain countries, as, for example, the United States. Further, every article is no included even in the treaties. It is necessary, therefore, to regulate by statute the duties imposed in these two cases; and the tariff so framed manifestly affords the starting-point for the negotiations. That tariff applies to the countries which offer nothing in return for concession. The

treaty countries purchase further privileges by offering terms on their part. Hence the necessity for determining the principles of the general tariff before entering on the negotiations. The Superior Council set to work by appointing two sub-Committees to report—the one on the textile industries, the other on the remaining branches of trade. The members of the Textile Committee visited this country, and inquired very carefully into the cost of production here. They came to the conclusion that generally it is not more than three or four per cent. under the cost in France; that this slight advantage is nearly, if not quite, neutralized by the cost of carriage to France; and that consequently the latter has little to fear from English competition. But from these premises the Committee shrank from drawing a Free-trade conclusion. They declared strongly in favour of very light duties, but they recommended that the general tariff should be fixed high enough to leave to the negotiators the means of purchasing valuable concessions. In short, they pronounced for reciprocity. The Report of the second Committee was substantially to the same effect. In the last place, both Committees recommended that the tariff of the expiring treaties should be taken as the groundwork of the general tariff, but that reductions should be made in several duties which are decidedly too high. These recommendations underwent protracted debates in the Superior Council of Commerce. The protectionists have an unduly strong representation on the Council, and they stubbornly resisted the too liberal Reports of the Committees. In vain it was shown that the commercial treaties only exchanged a prohibitive for a protective tariff; that, for example, iron, which is the main instrument of modern industry, and yarn, both cotton and woollen, which is the raw material of a multitude of manufactures, are taxed more heavily than in almost any other European country, and that in consequence the productive capacity of France is forcibly restricted. The Council decided that the tariff of the treaties should be adopted as the general tariff. The decision, though a disappointment, affords striking evidence of the progress made since 1860. For the protectionists themselves now offer, without asking for an equivalent, to all who choose to trade with them, concessions which Napoleon himself, fresh from the glories of the Italian war, was unable to extort from an obsequious Legislature. It was hoped that the Government would be guided by the recommendations of the sub-Committees rather than by the decisions of the Council. The members of the Government are favourable to a liberal commercial policy; M. Léon Say, the Finance Minister, is a distinguished political economist, and an hereditary free-trader. The Legislature, too, is favourable to free international intercourse. And, lastly, it is notorious that the protectionists have an undue representation on the Council. The Government, however, has acted otherwise. It has introduced a Bill in accordance with the decisions of the Council. Another decision of great importance was that specific duties should in every case be substituted for *ad valorem*. The other matters discussed had no special reference to this country, and therefore need not be particularly mentioned here.

This brief historical sketch will make clear, we hope, the difficulties to be encountered by the English Commissioners. France is fully convinced of the advantages of free unrestricted commercial intercourse. But she insists, at the same time, that for every concession she shall receive an equivalent. We, on the contrary, have frankly accepted Free-trade. We have repealed the duties on corn, on shipping, on manufactured commodities of all kinds, on sugar, and other articles of food. What equivalent, then, have we to offer? There is but one; for the tobacco duties hardly concern France. We still levy excessive duties on French wines. In itself, a reduction of the wine duties would be highly beneficial, for it is clearly desirable to counteract the taste for strong drinks by bringing within the reach of all the light and wholesome wines of France. The exclusion of those wines was one of the evil consequences of the long revolutionary wars and the crushing taxation they entailed. But a proposal to reduce the wine duties would raise in arms the landed interest of the United Kingdom, and the whole liquor trade as well. The agitation for the repeal of the malt duties would revive in full force, and the complaint of Ireland that she is overtaxed, every year repeated to an incredulous House of Commons, would gather fresh strength, and would be reinforced by the cry that she was sacrificed to foreign interests. It would be impossible, therefore, to reduce the wine duties without opening up the whole question of the duties on beer and spirits; and that is a question as to which the Chancellor of the Exchequer, on the one hand, and the Temperance agitation, on the other, would have much to say. The second difficulty is raised by the proposal to substitute specific for *ad valorem* duties. The contention of the Superior Council of Commerce and the French Government is that *ad valorem* duties induce fraud, that importers declare their goods to be of less value than they really are to escape the higher duty, that this necessitates the keeping up of a large staff of experts, and the institution of inquiries which cause delay, disputes, and annoyance; and that consequently the system is expensive to all parties, as well as vexatious and inefficient. On the other hand, it is clear that specific duties must either be prohibitive of cheap goods, or must offer a premium on dear goods. If, for example, a fixed duty is imposed on a given length or a given weight of a commodity, quite irrespectively of the quality, one of two things must happen. Either a substantial duty must be levied on the finer qualities, in which case the duty on the coarser will be prohibitive; or else the duty on the cheap article must be reasonable, and in that event the dear article will be so lightly taxed as to be virtually free. It

is evident that the protectionists and their representatives on the Superior Council of Commerce hope that the effect will be to prohibit the cheaper goods. But the English trade with France in textile fabrics is almost exclusively in the coarser and cheaper goods. The French manufacturers can more than hold their own in the finer qualities. The adoption of specific duties, therefore, to the exclusion of *ad valorem* would be disastrous to the English exporter. It is probable that the proposal is made only to induce the English Government to make concessions for which it would not otherwise be prepared. For it is not credible that in the present state of opinion it is really desired to prevent the poorer classes in France from buying cheap English goods.

THE LAST OF THE OERA LINDA BOOK.

ON July 1, 1876, we called attention at considerable length to a very extraordinary work which was published in Holland in 1872. It is the transcript of a manuscript which professes to be written in the Old Frisian language, accompanied by a Dutch translation and introduction vouching for its authenticity by a modern Frisian, Dr. J. O. Ottema. The original Frisian text, accompanied by an English translation from Ottema, was edited last year by Mr. W. H. Sandbach, and it was through this English edition that our attention was drawn to the work. The story of the manuscript may be recapitulated in a few words. A workman at the dockyard of the Helder, by name Gerrit Over de Linde, was the happy possessor of the precious document, and stated that it had belonged to his family for unknown generations. This appeared to be placed beyond doubt by a letter placed at the commencement of the manuscript, dated 1256, signed "Hiddo tobinomath oera Linda" (Hiddo, surnamed Oera Linda), and addressed to his son, whom he conjures to preserve the document with the greatest care, as it contains the entire history of the Frisian people. This letter is followed by another, bearing the well-nigh incredible date of 803, signed "Liko tonomath ovira Linda," and addressed to his posterity, entreating them to preserve the document in secret, and never to let the eyes of a monk behold it. Thus the dockyard workman appears to have found a very respectable antiquity for his family.

When we say that the manuscript gives a history of the Frisians from the earliest times, and that it appears throughout to be a contemporary chronicle of the various ages, this alone will be acknowledged to render it one of the most remarkable in Europe. It will naturally be supposed that it goes back at furthest to the first century of our era, and recalls the campaigns of Germanicus, or possibly of Julius Cæsar, among its dim reminiscences. But how great is the marvel when we find that the first portion professes to be written by Adela, "Burchfām" or Borough-Lady of the Frisians, 559 B.C.; that the Frisians originally occupied the same territory as later, but wandered southwards under Wodin as king, and Teunis (called Nephew Teunis, Nēf-Tunis, otherwise Neptunus) as sea-king, arrived in Phœnicia in 2000 B.C., and built Tyre; that in 1630 B.C. the city of Middelburg in Walcheren was so fortunate as to be ruled by that wise Borough-Lady Minerva, who subsequently assisted her faithful Frisians to found Athens; that the Frisians somewhat later got from the Mediterranean to India by sea, and landed at "Pangab"; and much more equally marvellous. The constant mixture of mythology and history, and the anachronisms in the use of names (of which the Pangab, i.e. the modern Persian Panjāb, is an obvious instance), obliged us to express the strongest doubts of the authenticity of the document. These were then amply justified by an examination of the language, which turned out to be such a hash of words without any proper attention to inflexion or grammatical concords as might be produced by an ignorant person adventuring with an Old Frisian dictionary and some native wit, but not a spark of knowledge of the possibilities of language.

It must not be supposed that the manuscript which contained all these absurdities passed muster in Holland generally. Dr. Ottema vindicates its genuineness in an introduction in which he pleads for the credibility of its contents, and for the impossibility of imagining a possible epoch or a likely motive for forgery, and clenches his argument with the statement that it cannot have been fabricated in modern times, because no one now living is competent to write in the Old Frisian language at all. Moreover, he states that Dr. Heleo Verwijs, a competent scholar, had "immediately recognized it as very old Frisian"; of which anon. The Frisians generally appear to have been so dazzled by the picture of their unsuspected antiquity and greatness as to be unable to employ either common sense or criticism on the matter. But the Dutch Academy of Sciences would have nothing to say to the manuscript, and refused even to look at it. Even Mr. Sandbach says that the controversy is not yet settled. Yet, when he wrote, it had been set at rest for three years, although the result was not then published.

We little thought when writing our criticism last July that the mystery, which might, like many other celebrated forgeries, have remained a mystery for ever, would be so soon cleared up. Mr. Sandbach in his preface said that those who condemn the manuscript as a forgery "allow it to be one hundred, or perhaps one hundred and fifty, years old." M. Jules Andrieu wrote an ingenious letter to a contemporary, in which he gave good reasons, based on extensive and curious reading, for believing the manuscript to have been written by a patriotic Dutchman about the year 1700, and to be the plea of a freethinker for a "Republic

based on justice, truth, and purity of morals, and having for its religion an impersonal Deism without forms of worship"—opinions which it was so dangerous at that time to utter at Amsterdam, that the writer had hidden them under this remarkably thick veil. Thus, says M. Andrieu, there was no *forgery* at all:—"There is no more forgery here than there would have been had *Tremachus* appeared anonymously in Greek." But what if *Tremachus*, so far from "appearing"—i.e. being printed and published—had been shown in private circles in a manuscript studiously contrived by devices of paper, ink, and characters to mislead the unwary into a belief that it could not have been executed later than the thirteenth century? In the face of arguments like those of M. Andrieu, we ventured to hint that the manuscript was fabricated since 1853, and that there were Frisians living perfectly competent for the task.

The whole story is now given in the *Nederlandsch Spectator*. We give the essential points. In 1867 Dr. Verwijs at Leeuwarden received a letter from a Mr. J. at Harlingen, requesting him to examine some leaves of the manuscript, which were enclosed. Dr. Verwijs is said to have at once entertained suspicions of an intention to deceive him, especially as he could at first obtain no information where the manuscript came from. On learning later that the leaves belonged to Mr. Over de Linde at the Helder, who had many more similar ones, he wrote to the possessor that "the book was very interesting, and *was written in very old Frisian*," at the same time instituting inquiries respecting the possessor. The answer was to the effect that Gerrit Over de Linde had passed all his early life at sea, and understood no Frisian, not to speak of Old Frisian; was, in short, a simple workman, perfectly honest and incapable of deceit. Thereupon Dr. Verwijs went to the Helder and called on Over de Linde, who received him politely, showed him all the sights of the place, but was in no hurry to exhibit the manuscript. At last, however, it was produced, and all eyes were fixed on the celebrated linguist of Leeuwarden, who was to unveil its mysteries. "Pray translate us something out of it," said the old gentleman, "then we shall know something about it, for of course we cannot understand any of it." He listened with rapt attention while Dr. Verwijs read, and discovered the study of languages to be most interesting, and of course quite new to him, who had passed all his life at sea. Dr. Verwijs was asked to translate more; explained the meaning of obsolete words satisfactorily, and made himself highly popular, and the precious heirloom was in the end entrusted to his care to be more completely deciphered.

Let us here observe that this part of the story seems to acquit Dr. Verwijs of the imputation of having been even at first taken in. His declaration that the manuscript was in very old Frisian, which is paraded by the editor of the *Oera Linda Bok* was made in the first letter written by him to its possessor; and thus, as well as his subsequent conduct towards that gentleman, appears perfectly consistent with an intention to sift the matter to the bottom, and to gain his confidence as a means to that end. Any suspicions he then entertained he would naturally withhold until he possessed sufficient evidence to justify the publication of them. When, after the examination of the manuscript, he declared against its authenticity, the Over de Linde family sought to discredit him by publishing the above-mentioned letter. Whether there was any morally culpable double-dealing in his conduct we cannot attempt to decide without a more detailed account of the transaction; but his intellectual repute as a Frisian scholar appears to be relieved from suspicion.

Gerrit Over de Linde died in or about the year 1873, and a curious revelation was soon made. A chamber of his house, which he had always kept strictly private, was entered, and it turned out to be the workshop where the *Oera Linda Bok* had been fabricated! There was a whole library of books on Frisian history, languages and antiquities, mythology, &c., with plenty of grammars and dictionaries. One would like to have a complete list of these books, which would exhibit the sources, some of them certainly reconditæ, from which this unlettered man had drawn the curious ideas, and the more curious distortions of facts of history and mythology, of which his book is full. We may certainly be pretty sure that the books mentioned by M. Andrieu, De Grave's *République des Champs Elysées* (Ghent, 1806), Rudbeck's *Atlatenica sive Manheim* (Upsala, 1679-89), Justus Lipsius's *Letters* (Lugduni, 1616), &c. (or others which had copied from these) were among them, since they turn out to be the *fons et origo* of some of the most eccentric ideas of the *Oera Linda Bok*—unless indeed they had been previously parted with as too tell-tale. How M. Andrieu could know De Grave's book, and not come to the conclusion that the writer of the manuscript must have known it well and used it extensively, we are at a loss to conceive; especially as he himself notes the division of "Min-Erva" into two parts, as in accordance with that writer's etymology. Besides the books, a stock of "Overlandsch papier" (which is mentioned in the pretended letter of 1256, prefixed to the *Oera Linda Bok* as "wrlandsk pampyer"—the form "pampyer," or *pampier*, is one of the most suspected words, being a modern Dutch vulgarism) was found, partially covered with more writing in the "*Oera Linda language*"—the genu probably of a second Old Frisian manuscript, cruelly cut off before it could see the light. It contained an account of *Brahma* and *Brahmanism*, in which the name of the Indian god was derived, not from that of the Patriarch Abraham (which has been ventured by some writers of repute in their day), but from his Dutch diminutive *Brammetje*! None but he who explained Neptuneus as Nêf-

Tunis could surely have perpetrated this. The discovery was of course kept strictly secret by the family as long as possible. When and how the truth came out we are not informed, but it was not known in Holland till late in 1876 at the earliest.

Another amusing incident remains to be noted. The editor of the *Oera Linda Bok* drew especial attention to the paper on which it is written. He said it was *cotton paper*, which was manufactured in China from very remote times, and, becoming known to the Arabs by the conquest of Samarcand about the year 704, was made by them at Damascus, and subsequently by the Greeks, Spaniards, and Italians; but after the thirteenth century, especially in European countries, was supplanted by linen paper; hence this paper must have come from Spain, and could not be much later than the date assigned, 1256. Last year, however, Frederik Muller, the antiquarian bookseller of Amsterdam, and a Mr. Smidt van Gelder, published a declaration that they were perfectly acquainted with the paper of the manuscript, and that it is neither ancient nor foreign, but made by an existing firm at Maastricht. The discovery in the secret chamber at the Helder shows the learned editor and the learned bookseller to have been equally at sea. The paper is Chinese, and was brought by the seafaring author of the *Oera Linda Bok* himself from China.

THE DOCTRINE OF PROVOCATION.

THE case in which Lord Marcus Beresford has just been sentenced to a fine of 100*l.* and the costs of the prosecution for a common assault on Mr. Tidy, a solicitor with whom he had had money dealings, is chiefly important as laying down that, as a rule, in a case of this kind the question as to whether any provocation was given has no bearing on the charge against the accused; and it is to be regretted that this principle was not more strictly enforced during the proceedings. The simple question was whether Lord Marcus had committed the alleged assault, and the evidence ought to have been confined to that point. As it was, however, the cross-examination amounted, as the Solicitor-General remarked, to "a course of insult to the prosecutor, which, if permitted in such cases, would become a public nuisance." Nothing would give more dangerous encouragement to the spread of violent assaults than the knowledge that, if a trial followed, the prosecutor could be put through the ordeal of having all his life laid open, and charges made against his character, which, whether true or not, would have a damaging and painful effect. A muscular bully who felt sure of thrashing his victim might go about with comparative impunity, picking all sorts of quarrels or intimidating people to grant his demands, if it was foreseen that proceedings against him would involve a cruel badgering of the ill-used person, and the exposure of the most private circumstances of his life, accompanied by gross imputations as to which no evidence could be given. It is easy to conceive the use which might be made of this weapon in any case where there was ill feeling about family matters, or in which an unscrupulous person, intimately acquainted with the career of the man he had chosen for attack, wished to terrorize him first by a brutal beating, and then by the prospect of having to go into the witness-box and be worried by a counsel posted up in all sorts of injurious stories and imputations about him. In the present instance it is clear that, whatever grounds of complaint Lord Marcus Beresford had against Mr. Tidy, he had legal opportunities of obtaining redress, and had no right whatever to inflict punishment with his own hands. Having by the use of a false name obtained admission to Mr. Tidy's room, and finding him alone, he locked the door so as to prevent assistance being called, and then committed what was not merely a gross and deliberate breach of the peace, but a violent attack, which he had evidently planned in a deliberate manner, and had come prepared to execute. The Assistant Judge, in passing sentence, justly remarked that one should always have regard for human infirmity in a case of passion; and in awarding punishment for acts of violence committed upon sudden provocation, due allowance ought to be made for a sense of wrong and injustice; but when the temper had had time to cool, and resentment took the form of premeditated vengeance, then the original provocation could not be taken as an excuse. The Judge added that he did not mean to imply that he thought there was any real ground of complaint against Mr. Tidy; for whatever the facts might be, they could not be received as an answer to the particular indictment.

As far, therefore, as the verdict and sentence went, the course of justice was satisfactorily adhered to; but it cannot be doubted that Mr. Tidy was entitled to the protection of the Court while he was in the witness-box, and that the cross-examination to which he was subjected was wanton and unjustifiable, the matters gone into having no effect at all on the issue being tried. Money-lenders are a class who are for sufficient reasons not popular in society; but, if they do anything which amounts to a breach of the law, they can easily be made amenable for it in the usual way. On the other hand, the system of curing evils of this kind by a free use of fisticuffs or bludgeoning cannot be extenuated or tolerated under any circumstances. It is clear what sort of condition life would get into if able-bodied young fellows felt themselves safe in using their trained bodily strength in order to take revenge for injuries which in many cases might be imaginary or merely invented for a

malicious purpose. If money-lenders are not exactly entitled to sympathy, neither are those who take advantage of their trade for their own convenience, and then think that, instead of paying what they owe, they are entitled to clear off scores by a personal assault. It was argued in this case that the injury inflicted on the prosecutor was comparatively slight; but this does not make a kick or a blow less an outrage. It will no doubt be noted that the accused, who is an officer in the army, deliberately gave a false name in order to obtain an opportunity of committing an outrageous assault. Yet we observe that the reporter states that at the close of the case there was "much applause, and shouts of 'Hurrah!'" and that a number of persons in court pressed forward to shake hands with the defendant as he left the dock." Most people, we imagine, will think that he has got off very easily, and that instead of a fine, which may be subscribed by his friends, a month or two in prison would not have been out of proportion to his offence.

REVIEWS.

PROTHERO'S LIFE OF SIMON DE MONTFORT.*

IN writing a new Life of Simon of Montfort Mr. Prothero is of course ready at starting for the question—Can a new Life of Simon be needed after the Life by Dr. Pauli, especially when an English translation of Dr. Pauli's Life has lately appeared, and that a translation which contains some new notes and references from Dr. Pauli himself? Mr. Prothero answers this question in a way which is at once modest and manly. He acknowledges his deep obligations to Dr. Pauli's book; at the same time he claims to have studied the subject independently for himself, to have gone more minutely into some points than Dr. Pauli has done, and to have come on some points to different conclusions from his. And he says with truth in his preface, "It is generally admitted by historical scholars that the student can derive nothing but benefit by carefully studying the views of even a larger number of independent writers on the same subject." Mr. Prothero has also drawn more direct advantage than Dr. Pauli could draw from the *Constitutional History* of Professor Stubbs. He had indeed written the constitutional part of his own volume before the Professor's second volume appeared; but he has evidently made use of it in revising his own work. And it seems that he has had further help from Professor Stubbs, as well as from Mr. Laund and other scholars, in the work of revising his own sheets. Altogether, we cannot blame Mr. Prothero's change of purpose when, having first of all intended merely to make a translation of Dr. Pauli's book, he enlarged his plan, and wrote an original book of his own.

It is only natural that Simon, who, if especially an English, is also a European personage, should be looked at from rather different points of view by an English and by a foreign writer. Dr. Pauli indeed knows so much of England, and he has given so much study to the history of England, that he comes as near to an English writer as a foreign writer can do. Still, after all, there is a certain difference. The German and the English conceptions of history, and the German and English ways of treating history, are not exactly the same; and a writer of either nation who judges a writer of the other by his own national standard is very likely to judge him unfairly. Dr. Pauli has certainly no reason to complain of his treatment at the hands of Mr. Prothero. Mr. Prothero pays Dr. Pauli the homage due from a younger to an elder writer, from a learner to one of whom he has learned; but his homage is the reasonable respect of a scholar, not the cringing servility of a slave. Mr. Prothero points out a few places where he thinks that Dr. Pauli has not quite followed the correct course of the narrative. And when he differs, he differs both firmly and respectfully. He is not port, as young German writers sometimes take upon themselves to be, to their English betters. We have known a young German doctor who was not ashamed to write "Stubbs imig," so and so, without further remark. Mr. Prothero goes more into detail with the constitutional part of the story than Dr. Pauli does; and we think that he shows that Simon's political action, though there were intervals in which he was less prominent than at other times, was spread over a more continuous range of time than is represented by Dr. Pauli. There is another point into which he has also gone more minutely than the German writer—that is, into the topography of the two battles at Lewes and Evesham, of each of which he gives a map. Of the Evesham fight we once gave some account ourselves. The two have geographically a good deal in common. Both of them were strictly battles—if Robert of Gloucester refuses the name of battle to Evesham, it is on another ground—as distinguished from the struggles of the century next before, which mainly took the form of sieges. In both cases one side—the Royalists at Lewes, the patriots at Evesham—were in possession of a town on low ground, while the enemy came against them over the neighbouring heights. In both cases then, the battle-ground, or part of it, is found on the high ground or its slopes. Except that a town is concerned, we seem to be carried back into the eleventh century. The battles of Simon have more in common

with the battles of Edmund and Harold, with Assandun, Stamfordbridge, and Senlac, than with the endless takings and retakings of towns and castles in the wars of the twelfth century. In that century there was one great fight in the open field—the Battle of the Standard. But that one is certainly yet further removed from the general character of a twelfth-century fight than Lewes and Evesham themselves. For in the Battle of the Standard the town of Northallerton plays no part at all. In fact, it could hardly have been a military post, as both Lewes and Evesham were. While we are on this local aspect of things, we rather wonder that Mr. Prothero has not taken more notice of the very praiseworthy book of M. Blaauw's, *The Barons' War*. That book was certainly the beginning of any really detailed examination of the history of Simon and his time.

Mr. Prothero has, we think, one advantage over Dr. Pauli in his title-page. He does not commit himself to a theory. We always thought that Dr. Pauli's neatly turned title went a little too far. At all events it goes too far in the shape which it takes in the English translation. Simon there becomes "the Creator of the House of Commons." Now, if we rightly catch the difference in the shades of meaning between the German and the English words, creator is a word one degree stronger than Dr. Pauli's own word *der Schöpfer*. Certainly we cannot allow that Simon was the creator of the House of Commons, though he was the author of one of the most important of constitutional changes, and may be called the creator of one great element in the House of Commons. It is better, as any one who has studied Professor Stubbs's *Constitutional History* will see, not to use such words as House of Lords and House of Commons at all till a later time. The different elements of an English Parliament were fast showing themselves, and Simon brought in one new and most important element; but it was not yet clear whether we were to have one House or half a dozen. But we surely get the germ of the modern House of Commons as soon as we get representation by knights, as distinguished from the personal appearance of the lords and barons. The knights, who had appeared already, and the citizens and burgesses whom Simon brought in, did in the end join together to make the House of Commons. And, unless Simon had brought in the citizens and burgesses, the knights alone could hardly have formed a House of Commons. At any rate, it would have been a very different kind of House of Commons from what we are used to. In this way we may say that Simon's reform led to the present form of the House of Commons; but he cannot be said to have created it, for one of its elements existed already, and it did not come out of Simon's hands in the finished shape which it took somewhat later. We can then hardly call Simon the creator of the House of Commons, but we may call him the greatest of all Parliamentary reformers. Mr. Prothero has worked carefully at this whole aspect of Simon's character. In the personal portrait of him Dr. Pauli has, as Mr. Prothero says, left little to be added or changed. When we read of Simon in either of them, when we read of him even in Professor Stubbs, who is perhaps one degree less zealous for him, when we read of him in almost any modern writer, we do indeed see a change since the days of Hume, and even of Hallam. Hume was consistent enough in not understanding Simon or anybody else; but one would have thought that Hallam would have had some feeling for so memorable a reformer. But, after all, the difference between Hume's Toryism and Hallam's Whiggism was not so wide as the difference between the point of view of either of them and the point of view of our own generation. It is simply this—that, since Hume's time, even since Hallam's time, life has been breathed into the dead bones. No one of Hume's day or of Hallam's day could have gone through the whole personal and political life of Earl Simon in the same way which both Dr. Pauli and Mr. Prothero have done. Some antiquary might have taken the same trouble to fix the pedigree of Simon as he might have taken to fix the pedigree of the obscurest of mankind. But till quite recent times no one could have looked on Simon as a really living man who did a really living work, a work which directly affects ourselves. The senseless worship of the "ancients" and the senseless contempt for the "dark ages" both came from the same source—the failure to understand that history is one, and that the "ancients" and the men of the "dark ages" were men of like passions as ourselves, performers in earlier acts of a drama in which the men of our own time are performers in a later act. In their estimate of the character of the man we see hardly any difference between Dr. Pauli and Mr. Prothero, though, on the whole, Mr. Prothero gives the more generous estimate. Both allow for the extraordinary difficulty of the position in which Simon stood in his last days. The knot was perhaps best cut by his overthrow, and the hauling on of his work, after an interval, to his destroyer. Simon did more for England, as well as more for his own fame, by dying for her than if he had lived for her. At the same time we must carefully distinguish Simon from those popular heroes whose fame was wholly due to their deaths. No one could have made a saint or a hero or anything else out of Thomas of Lancaster when he lived; it was easy to make a martyr out of him when he was dead. On the other hand, we have abundant witnesses of the contemporary estimate of Simon while he still lived, above all in the great Latin poem, the manifesto of the reforming party of the thirteenth century.

We had marked several of the passages in which Mr. Prothero argues against Dr. Pauli; but they are mainly points of detail, and amount at most to little more than omissions on Dr. Pauli's part; little more than failure to mark some particular action of Simon in

* *The Life of Simon de Montfort, Earl of Leicester; with Special Reference to the Parliamentary History of his Time.* By George Walker Prothero. London: Longmans. 1877.

English affairs. They may be left for special students of the time to work out. But we must ask Mr. Prothero not to talk about "Prince" Edward, "Prince" Edmund. The form is so very modern; it carries us by so sudden a jump from the thirteenth century to the eighteenth. One step more, and we should get to Mr. Mackenzie Walcott's "Hon. Roger," as the description of an earl's son in the twelfth century. "Edwardus," "Dominus Edwardus"—once, at least, "puer Edwardus"—may be "Edward," or "Sir Edward," or "Lord Edward," as anybody chooses; but no prince, save the Prince of Aberlraw and Lord of Snowdon. Nor should Mr. Prothero talk about Baldwin, when he came a-begging, as "the banished Emperor of Constantinople." Nobody banished him; he simply came a-begging, as some of his restored Greek successors did after him.

Mr. Prothero appears in his title-page as "Fellow and Lecturer in History, King's College, Cambridge." We feel sure that the youth of King's College must get some wholesome historic food, and must be sent to the right pastures to look for it.

THE ENVIRONS OF LONDON.*

HOW completely the face of the country round London has changed in fifty years it is not difficult to learn. When Lysons wrote his *Environs* he took the parishes within a circle of twelve miles; Mr. Thorne takes in a circle of twenty miles, and is obliged to cross his line continually. In fact, when we remember how easy locomotion has become, and how possible it is that after a few years railway managers may even see the policy of encouraging travellers, it is hard to say positively where the environs of London, as Lysons would have understood them, end. The milestones do not tell us. Distance is not a measure in estimating the comparative accessibility of two such places as Berkhamstead and Brighton. Mr. Thorne might have included Margate and Ramsgate, Harwich and Reading, as well as Enfield or Dartford, Navestock or Woodmansterne, had he taken the time occupied by the journey as well as the distance into consideration. But though all England may now be almost called the environs of the great city, the most interesting part, historically, is no doubt that which lies within Middlesex, Essex, Hertfordshire, Kent, and Surrey. These five counties present probably a greater number of places worth visiting than all the rest of England put together. Kingston-on-Thames, Windsor, Egham, Greenwich, Hampton Court, Runnymede, St. Albans, Richmond, Kew, Tilbury, Theobalds, Hatfield, are all remarkable in our history. Yet they are all well within the circle of twenty miles. The ivy-mantled church of Stoke Poges, the monumental brasses at Stoke D'Abernon, the view from Cooper's Hill, the "antique towers" of Eton, the Manor-house of the Bishops at Fulham, Pope's grotto at Twickenham—all these and others appeal to different minds, yet all are within easy reach of the London excursionist. There is Bedford, with its peacocks, and the inn where "Hervey" was discovered; there is Edmonton, where Gilpin did not dine; there is Walpole's Strawberry Hill, and Sudbrook, where Jeannie Deans saw the Duke of Argyll—a fact, by the way, which Mr. Thorne unaccountably omits. The same afternoon will show a tourist Burnham Beeches and Windsor, or Knole and Chevening, or Enfield and Waltham. In fact, such a neighbourhood exists for no other city on earth; and it is strange indeed that we have had to wait so long for a book like this. Mr. Thorne has evidently given much attention to the immense subject in his hands. He has read a very large number of books, and has made careful observations of his own. He is certainly not omniscient, and fails unexpectedly here and there; but on the whole he has given us a useful book, one which does him credit, and which fills very appropriately a void in our topographical literature. Mr. Thorne is perhaps, like some of his predecessors, too fond of one period at the expense of another. He is evidently but little interested in purely geographical, geological, and ethnological details. He makes no general remarks, but passes impartially from Surrey to Essex, from Gothic architecture to rifle-boring, from a catalogue of pictures to a quotation from Pepys. This is, no doubt, as it should be in a book of the kind. We do not want fine writing, nor, on the other hand, are we content with a mere directory. Mr. Thorne once or twice indulges in such phrases as "venerable in its solitude," or, warming over the beauties of Virginia Water, descants on the name as "a forecast of the forest wilds, the broad waters, and tranquil solitudes that were to be called forth by the waving of the magician's wand"; but, for the most part, his descriptions are plain and unvarnished; he avoids the excessive use of superlatives, and contrives to make an extremely pleasant impression on his reader. He is sometimes absurdly mistaken, as when, for example, he talks of a Dean of Westminster in 1483; sometimes he leaves out just what we should have expected to find, such as an account of the famous Hanworth Library; and sometimes uses such expressions as "admeasurement," "St. Thomas a Bucket," and others, which we could excuse; but, on the whole, his book supplies a great need, and must not, in its first edition at least, be too narrowly examined.

It is impossible, of course, to go through a book of this kind as if it were a novel, or even a connected history. But, by way of showing how far Mr. Thorne may be consulted with advantage, we may examine his notices of some one class of objects, or test his

accuracy and taste by going through his pages with a view to discover his opinions on some question of antiquity or art. For example, we observe copious articles on Cowey Stakes and on the supposed *oppidum* of Cassivellaunus at St. Albans. Whether we adopt Mr. Thorne's opinion or not, it is certain that he leaves us in no doubt as to what it is. We have not been able to see any reason for considering Beech Bottom the *oppidum* of Cassivellaunus more than that of any other ancient Briton, and have always a wary feeling towards theories announced as "ingenious." Mr. Thorne, after noticing the possibility that Beech Bottom may be a part of the Roman road, goes on to say, "But an ingenious and more feasible explanation has been proposed by Mr. Samuel Sharpe, who regards it as a portion of the defences—the outer wall and fosse mentioned by Caesar—of the *Oppidum* of Cassivellaunus." He then traces a circumvallation four miles and a half in circuit, enclosing about eighteen hundred acres, and expresses his belief that Mr. Sharpe's general conclusion is well founded. With regard to Cowey Stakes he is equally explicit. He wisely adopts the opinion of Dr. Guest, determined no doubt, if he is wrong, to be wrong in good company. His notice of the question raised is well arranged, giving all the authorities for and against his own view, and summing them up with clearness. In his article on St. George's Hill above Cowey, he concludes that the work is British, again judiciously following Dr. Guest. With regard to the earthwork at Barking he is not so sure. Dr. Guest is not available here, and Mr. Thorne is careful how he expresses a positive opinion. It will thus be seen that, though he has views of his own, he has read and weighed the views of others, and that we may find the best authorities quoted in his book.

On another subject Mr. Thorne's private judgment is more freely exercised. In his accounts of churches he makes frequent mention of restorations. This is a point of interest just now, and it may be worth while to see what he says. Very few of the churches within the circle of twenty miles remain untouched. Most of them have been "restored," and almost all have suffered in the process. Here and there improvement has resulted, as, for instance, at Finchley, and perhaps also at Greenstead, where the wooden walls have been preserved from certain destruction, and where, as Mr. Thorne reports, "nothing could exceed the care and taste with which the work was effected." Against a few places where he can speak approvingly—half-a-dozen at most—there is an appalling list of "restorations wrought under the misused name of restoration." Mr. Thorne's remarks on this head are always brief. He never says much, but we must suppose "he thinks the more," and certainly what he does tell us is enough. The environs of London contain, according to Mr. Thorne, about thirty ancient churches in which "restoration" has been only a polite name for what used to be called Vandilism. We take a few examples as they occur. Mr. Thorne's usual phrase is something on this wise:—"The church is E. E., but has been restored, and has lost much of its venerable and picturesque aspect." The "but" is used as a mild way of finding fault, and by no means suffices for some of the cases. Thus, at Drayton the church is kept shut; "this, however, is of little consequence, the church having lost of its interest." At Eton College Chapel the additions made by Wren have been swept away, and some mural paintings—as "inadmissible in a Protestant church"—erased. At Heston, a very interesting and typical church, containing Norman, Early English, and Decorated work, but usually Perpendicular, was entirely removed by the restorer, with the exception of the tower. At Leatherhead "the old work was much altered in this recent restoration." At Merstham the mouldings have been re-chiselled; this is the case in many other places. At Mickleham "the body of the church was entirely remodelled under the pretence of restoration in 1822-3." The old chancel was removed in 1872, and a new one built. At Stoke D'Abernon "the chancel arch was semi-circular, and was by some called Saxon, but it was taken down, and a pointed arch substituted when the church was restored in 1854. The church was restored anew, in accordance with more advanced ecclesiastical tastes, in 1866, and in the course of the two restorations so much was taken down and rebuilt, so much recast, remodelled, and re-chiselled, so much old work replaced by new, and so much new work made to look like old, that it would now be unsafe to trust the apparent antiquity, or attempt to distinguish the relative ages, of any part of the fabric." This very successful "restoration" was, we believe, the work of an amateur, and was much more complete than even Mr. Thorne appears to know, although some members of the Surrey Archaeological Society, who remember long and short work in the masonry and other vestiges of extreme antiquity, could have given him information on the subject. But a well-qualified architect sometimes restores quite as thoroughly as any amateur. There was a most interesting "half-timbered" church near St. Albans, one of the few examples of the kind in existence; it had a treble claim on our attention; for, in addition to its own curiosity and beauty, it was situated on the site of Verulam, and was the burial-place of Lord Bacon. Let us see what Mr. Thorne has to say of it:—

The church was thoroughly restored by . . . in 1867, when Elizabethan porches, ceilings, and fittings—that one felt strengthened the Baconian associations—were swept away, and new roofs, windows, mouldings, pavement, and seats substituted. The church looks modern and somewhat commonplace now, but is really among the most ancient we possess.

And this is not all. Mr. Thorne continues, when speaking of the interior:—

The Verulam chapel, opposite the tomb, with its Elizabethan entrance,

* *Handbook to the Environs of London.* By James Thorne. London: John Murray. 1876.

ceiling, and pews, had quite a Bacon character before the recent restoration, when all that was modern was swept away, and the chapel reduced to an ordinary chancel aisle."

The name of the architect who perpetrated this barbarity is given in full; but we omit it here, thinking it possible Mr. Thorne may have been misinformed, as it is improbable that the local authorities can have entrusted to the same hand another and much more important building in the same neighbourhood. The case of Waltham Abbey is also spoken of in severe terms:—

The east-end of the church is, except the main work, entirely new, and in a style much later than the body of the church. . . . The greatest innovation made in the process of restoration was, however, in the decoration. . . . Below the eastern lancets and spandrels are subjects from *Æsop's Fables*.

Mr. Thorne omits to remark that, as if to make these very objectionable subjects as much out of place as possible, the "Dog and his Shadow" is figured, unless we are greatly mistaken, the size of life, immediately over the communion-table. This also was the work of an eminent architect whose name Mr. Thorne gives, and who had a very narrow escape of being entrusted with the decoration of a great cathedral church. After these examples it is hardly worth while to refer to South Ockendon, where the "old charm has been destroyed by restoration"; or to South Weald, where "the brasses, all imperfect, have been taken away, except the inscription of Sir Anthony Brown's, d. 1567, and the slabs used for paving-stones outside the church"; or to Stifford, which "was deprived of its air of hoar antiquity by restoration in 1865"; for it is, indeed, hardly possible to open a page without some complaint of the kind. Any one disposed to take up the question now will find a good store of accessible examples in these volumes. It is too late to save most of our parish churches; but a few remain, and Mr. Thorne has conferred a benefit on future generations by his outspoken criticisms. His taste, in fact, appears to be singularly acute and discriminating; and we feel sure when he condemns a house, a church, or a picture, that he is justified in his opinion. In some cases restorations in the strict sense of the word have been accomplished, and he mentions several places where ruin has been averted, as in the tower of St. Albans Abbey; but such examples are exceptional, and only go to prove the justice of a complaint now more and more often heard, that restoration is another name for the destruction of all that gives our English churches their unique value—the marks, namely, of successive generations, the associations of centuries, the beauty of irregular picturesqueness, and the delicate charms of age and incongruity.

The chief fault of the book is that Mr. Thorne has made little use of original authorities. He does not, it is true, gather his facts from every source, trustworthy or untrustworthy, and pour them all out undigested, like a late writer on London topography. He gives his authorities, makes frequent references, and at least enables his reader to judge for himself. But this is not exactly what is required in a "handbook." Mr. Thorne does not seem to have gone himself to charters, or indeed to any manuscript evidence whatever. He takes Lysons, for example, or Hasted, or any other author, in their quotations from Domesday and their references to the Patent Rolls, just as they stand, without attempts at verification. To this practice must be attributed most of the errors into which he has fallen. It is not long since (December 2, 1876) a mistake of Dugdale's as to the Blackfriars Priory at King's Langley was pointed out in these columns. But Mr. Thorne follows Lysons and others without question in quoting Dugdale. This one article indeed abounds in mistakes. Mr. Thorne says that the priory "appears never to have been wealthy." It was the richest house of the order in England. He says that nothing but the memory of the priory buildings is left. A moment's reference to the Ordnance Survey would have undeceived him on this point. The shields on the tomb of Edmund of Langley still bear the arms they bore in Chauncy's time, and no restoration has been attempted, though we cannot say how long the monument may escape. Mr. Thorne has, we fancy, never visited the place; and, though it is not to be expected that he should visit all the places of which he treats, he should at least obtain accurate information before he writes so positively. In speaking of Slyfield, an old manor-house in Great Bookham, he mentions the heraldry which adorns one of "the lower rooms," and says the arms are those of the Slyfields. But the arms are those of the Shiers family, and the best example of them in the house is not in a lower room over the chimney-piece, but in an upper room on the ceiling. These are small matters; but it is in extreme accuracy in such small matters that the virtue of a handbook lies. Under Runnimeade we are told that here John "signed and sealed" the document spoken of further on as "Magna Charter." What is Mr. Thorne's authority for the statement? It would be interesting to know how the Great Charter was attested, and, if Mr. Thorne has any exclusive sources of information, he should make them public. We are also in doubt as to his views on the history of manors. Does he quite understand what a manor was, and how the manors of Domesday differed from those of the time of the Dissolution? Compare, for example, Mr. Thorne's account of Enfield with that given by Lysons. Mr. Thorne has evidently taken his entirely from Lysons, but with additions and subtractions of his own, by which the older work is spoilt. Lysons begins with the Domesday account, according to which there was one manor of "Enefelde," which was in all probability at that time conterminous with the parish. He goes on to speak of the various lords, including the Mandevilles and the Bohuns, until it came to the Crown. After a long account of this—the chief, and in a Domesday sense

the only, manor—he next speaks of Worcesters, so called no doubt from the great Earl of the Tiptoft family, and of various other parts into which before the fourteenth century the original manor had been cut up. This is perfectly clear, and leads to no misconceptions. But when we turn to Mr. Thorne we find him commencing, "Enfield had eight manors," and then going on to quote Domesday, and coming back to tell of the descent of the original manor, without any indication that all the eight were one by one taken out of it. Mr. Thorne may know more on the subject than we give him credit for; but if he does, he manages to conceal the fact very successfully. He follows Lysons, but not closely enough in this and similar instances; yet he follows him too closely in others; for in his notice of Thames Ditton he says, "Miss Boyle married first Lord de Ros, and afterwards Lord Henry Fitzgerald." There is a genealogical error here; but we need only remark the spelling of Lord de Ros's name, which Mr. Thorne seems to have derived from Lysons.

But the number of little errors of this kind is something enormous. Making every possible allowance, and taking out the long list of misprints appended to the second volume, we are surprised to see a book of this character contain so many. Sir Baldwin Wake is called "Wyke." The *Journal* of the Archaeological Association is called "Archæol. Journul." Mr. Giliatt is called Mr. Gilbert. But it would be tedious to notice a tithe of them. One, which is corrected in the list of errata, is a mistake, not only of name, but of fact. At p. 73 we read that Chesterfield House, Mayfair, of which passing mention is made, is "now the Earl of Abercorn's." This is corrected into "Duke of Abercorn's," but both are wrong, as it is some years since the house passed into the hands of a commoner. It is now understood to have become Lord Dudley's. In like manner we are told, at p. 189, of a villa belonging to "the Marquis of Carmarthen." It is some years since the Marquess became Duke of Leeds. The late Lord Stanhope is spoken of as the present owner of Chavening. Mr. Thorne is sadly puzzled by the word "Rome" in certain names, as "Rome Lane" at Enfield, and "Rome Land" at St. Albans and Waltham Abbey. In speaking of the Lane, he conjectures that it was so called from "some tradition connecting it with" the Gunpowder Plot. Under Waltham Abbey, he quotes Mr. Walcott as thinking that Rome Lands were so called "from *rome*, roomy, as in Romney, Romsey," &c., but he adds his own opinion that "this seems very doubtful." He further increases the difficulty by a paragraph on the name of Romford, in which he says that it "is derived from the ford over the Bourne (called by some writers the Rom), a shallow stream." After noticing the supposition that it refers to the Roman road, he goes on, "Others more plausibly suggest that it was the broad ford, from the A.S. *rum*, broad, the brook here spreading out into a wide and shallow stream." He is very near hitting the truth in the next sentence. "If, however, the Rom were the ancient name of the brook, it would simply mean the ford over the Rom." It does not occur to him to go a step further, and seeing that "bourne" means brook, and "rom," or, as he spells it elsewhere, "rome," means broad, so Rombourne means the broad brook, and Romford the way over it. In those distant places Lysons is not available, and Mr. Thorne is thrown back on his own resources. He fails in one or two other particulars from mere hurry or carelessness, as in the notice of Sopwell Priory, near St. Albans, of which he tells us that not a fragment is left, though a very superficial examination of Sir Richard Lee's house would have shown him that it was built in and on the old walls, and is really the old priory altered and adapted.

The information is not brought down to the present time in many cases besides those we have noticed above; but a more serious fault is the omission of the distance from London, which should have been given in every instance. We miss also some account of the livings; for, though the churches are generally described, we are not told whether they are served by rectors or vicars, nor are the patrons indicated, nor the income. A few skeleton routes for excursions might have been added with advantage, as well as a map or two, the mean level, and other notes of the kind. And there is great cause for dissatisfaction in the division of the work into two volumes. The arrangement in alphabetical order renders this form peculiarly unsuitable. One is sure to find on an excursion that the volume left at home should have been brought. Although this is by far the fullest book of the kind published up to the present time, it must be still fuller before we can say we are quite satisfied. If we thank Mr. Thorne for what he has done, it is rather with a keen sense of favours to come, a hope that from this may grow a book worthy of the greatness of so great a subject.

DOUDAN'S CORRESPONDENCE.*

THE recently published correspondence of M. Doudan is a book which should not be allowed to pass without notice. It is one of those exceptions to the general inferiority of modern letter-writing which may be said to prove the rule. Modern letters are for the most part bad, because their writers are in a hurry, and possibly because innumerable literary channels, open to all men of moderate ability, draw off some of the talent which would in other times have been devoted to letter-writing. A Mme. de Sévigné at the present day would be a popular novelist, and would refer her daughter to the newspapers for contemporary gossip. M. Doudan led an exceptional existence, and therefore reached an excellence in

* X. Doudan. *Mélanges et lettres*. Paris. 1876.

epistolary writing which is now equally exceptional. He was as anxious to avoid as others are to attract public notice. His position made him independent of literary labour, and the fineness of his taste made him over-exacting in self-criticism. His conversation we can easily believe to have been charming, and the letters, of which a collection is now published, were almost his only means of uttering his sentiments. The conversation, we fear, has vanished for ever. A few articles on philosophy and criticism, and the letters of which we are about to speak, are our only means of appreciating an intellect marked in a high degree by the characteristic excellences of the best French type.

A word or two must be said of Doudan's life. He took a characteristic pleasure, it seems, in enveloping his history in a certain mystery. He seldom spoke of himself, and the most intimate of his friends knew very little of his early life. Born in 1800 at Douai, he came to Paris to finish his studies, and made a few friends amongst the more distinguished men of his own standing. He might possibly have taken to a literary career, for which he had already shown a marked aptitude. In 1826, however, he was recommended to the Broglie family, in order to superintend the education of Madame de Staël's son by her second marriage. There he rapidly won the affectionate confidence of the Duke de Broglie, and when, after 1830, the Duke became a Minister, Doudan was for some years his private secretary. We are told that all who had to do business with M. de Broglie during that period remember the charming conversation which enabled them to endure with patience the hours of waiting in an ante-chamber. He rendered more serious services to his chief in the composition of despatches and in giving advice upon all important matters. Public appointments were pressed upon him, but when M. de Broglie retired in 1836, Doudan preferred to remain a member of his family, and during the remainder of his life was one of the most conspicuous figures in the society which met in the Duke's salon. There the fineness of his wit and the keenness of his logic enabled him to hold his own against the ablest of conversational gladiators. "If he would only write something," said Cousin, after an evening in his company, "he ought to be a member of the Academy; no one, since Voltaire, has had so much wit." The impression made upon competent observers is attested by a phrase of Sainte-Beuve. The great critic spoke of Doudan as one of those "*esprits délicats, nés sublimes, nés du moins pour tout concevoir, et à qui la force seule et la patience d'exécution ont manqué*." The affection with which he was regarded by the family of which he had then become a member was doubtless a greater consolation to him than even the applause of such distinguished men, and he evidently needed it. A good constitutionalist and a believer in the excellence of English institutions, he was a melancholy spectator of political events after 1848. His health was not strong, and he had some valetudinary tendencies. He clung to Paris in order to be near a favourite physician, and passed there the dreadful winter of 1870-1. Speaking of the terrible cold one day, he says, with unusual bitterness, that Providence seemed sometimes like Mmc. Benoît, who was never to be found at home. He survived the siege, but died two years afterwards, at the age of seventy-two.

The letters correspond in their tone with the character indicated by such a career. They are marked (and in this respect, by the way, they are an odd contrast to the recently published correspondence of Balzac) by an entire absence of egotism. Doudan takes an interest in everything except himself. Though a man of wide culture and keen intellect, he has resolved upon, or rather he has spontaneously adopted, a practice of complete self-effacement. He is essentially a looker-on; affectionate and deeply interested in the happiness of others, but never speculating upon his own concerns, except, indeed, at moments of ill-health. We are always tempted to wish that so admirable a critic of men and books could have trusted himself in the open arena. But the reluctance is characteristic. He speaks of it himself. He is not, he says, naturally jealous, but he is discouraged by the excellence of others; and says to himself, when he reads a good article, "You are quite incapable of writing like that; all these ideas would never have occurred to you." He consoles himself by reading incessantly at every leisure moment. "I read always, and have only ideas of my own by accident, like flies passing before my book." If he returns to the world, he adds, he will be a naval officer. It is better to see a fine tropical night from the ship's quarter-deck than to read other people's travels at the fireside. The fireside, however, is his natural place, though he sees the objections to the over-nicety which condemns him to stay there. He fancies his hand trembling in reading an address to the Academy:—

One should not attach too much importance to important things, or one does not do them. *Il est bon de savoir faire à peu près; tous ceux qui ont fait beaucoup ont fait à la diable*; to be a good architect, one must be without the subtleties of Bevenuto Cellini. With these subtleties one makes a dozen poignard-handles, and life is passed.

Yet he can find consolation for a friend who, like himself, errs on the side of refinement. Success in the world is won by the coarse intelligence which takes things in the gross, and does not trouble itself about minutiae. Whilst you, he says, "are contemplating a butterfly's wing with tremors and emotion, these Cyclopes have swallowed the wings of roast fowls." They will laugh at you for your thoroughness and refinement. The world does not look closely at anything:—

When its great wheels, greased with whale-oil, meet the light delicate wheels carved in diamond, and moving rapidly and noiselessly on a polished axle, there is a shock; but the little wheels are still of diamond, and do

not break. You will have your turn in eternity, where the butterfly's wing is held superior to a Mayence ham, but here it is the reign of the Mayence hams. Do what you will, you will never eat as fast as the rest. The ham will set you thinking of the bear, the bear of the forest, the forest of the mountains, the eternal snows, the silently-flowing rivers, and meanwhile nothing remains of the Mayence ham but the bones, and you are left pale and rather moody amongst this band of healthy, well-fed good fellows who will laugh at you when they have a chance. Let them eat till they die of it.

If Doudan was too fastidious for competition with the rougher strugglers for success, it was not from any intellectual effeminacy. It was the absence of ambition, not any want of power, that held him apart. One of his friends tells us how M. Villemain used to be palpably nervous when about to meet Doudan after some new publication. His criticism, indeed, has a keen edge to it, and he was too honest to dull it by flattery. Many passages in the letters show how well he could sharpen his weapons. There are, for example, some sharp touches at M. Renan. A clever man ought, he admits, to have some vague as well as some clear ideas, without which he will discover nothing; but still "there must be some bones solid enough to sustain any living being whatever, if it is not of the race of serpents. I can't see the bones of M. Renan." He strikes out a happier phrase in speaking of the Life of St. Paul. M. Renan, he says, "is a great coquet amongst theologians and savants. His coquetry is dashed with impertinence, but he gives to the men of his generation what they desire in all things—bonbons with a flavour of the Infinite (*des bonbons qui sentent l'infini*)."

Doudan naturally appreciated the merits of Sainte-Beuve, and says that their friendship had lasted without a cloud until some trifling difference two years before Sainte-Beuve's death. Perhaps a cloud would have appeared earlier if the critic could have read the letter in which his friend commented upon one of his articles. Sainte-Beuve had spoken cruelly, it seems, of Cousin and Villemain at a painful moment. A singular man is this Sainte-Beuve, observes Doudan:—

He has a violent instinct for finishing off the sick. As soon as he hears that a man has fallen in the street, he runs out with a packet of fine needles ready to stick into the flesh. He throws himself *à corps perdu* on the dead, especially if they have been his friends, and makes their confession out loud to give a little amusement to the standers-by.

Doudan, it is plain, would have been in no want of needles had he wished to gain credit as a public operator. There are many critical passages of a similar quality in the correspondence, some of which might excite the wrath of the ardent admirers of Lamartine or M. Victor Hugo—that "Michael Angelo in terra cotta," as Doudan calls him.

Doudan, as one of his friends tells us, regarded himself as best qualified to be, like Socrates, an intellectual midwife. Another represents him as a kind of literary confessor; and in such offices he would doubtless be inestimable. He would not have been a Frenchman if he had been incapable of making a stinging epigram on occasion; but his epigrams show more than the dexterity common to most of his countrymen. He possessed in a very high degree the quality which Frenchmen call *bon sens*, which is not identical with English good sense, though closely allied to it. Where the sound judgment of an English writer is masked by apparent brutality, the sound judgment of a Frenchman is masked by the lightness of his touch. He is too clear and felicitous to get credit for his real logical force. Doudan, however, is free from any petty affectation. His felicities come spontaneously in the effort to express his thought; they are no external ornaments; and they therefore prove that his thinking is really acute. His modesty and reticence translate themselves into a playful irony. His tone is that of a man of the world too wise to be really ashamed of warmth of feeling and depth of thinking, but yet most anxious not to obtrude them upon his correspondents. He prefers to cover them under a slight veil of apparently cynical sentiment, and shrinks from extravagance of phrase as he would shrink from any action indicative of social vulgarity. But uniform elevation of tone shows that he is never cynical in the worse sense of the word. The purity and modesty of his character show themselves in his literary tendencies. A true Frenchman of the old school, he separated gradually from the romanticists, with whom he had sympathized in his youth, and looked with amazement or dislike at their later developments. He speaks with cordial hatred of the immoral school which, as he says, has for its motto, "The devil is not so black as you think." Some people, he thinks, want to find out whether evil is not perhaps good, and try to dress its rather repulsive face in all the ornaments of the imagination. "Let's see if this band will not look well on its forehead; try if these pearls would not suit its long ears, and these wild flowers go well in its flat hair? But no waiting-maid is clever enough to disguise the secret ugliness of this arrogant animal." His disgust at such attempts perhaps made him rather too benevolent to some modern English novels. He criticizes them with a respect which is rather surprising, though it may be flattering. But he explains very well why a foreigner cannot be quite a competent judge on such matters; and we may add that he was brought up on Walter Scott. His hearty love of that great man may have prejudiced him in favour of some of the great man's compatriots. Moreover, as a constitutionalist and as a disciple of the French school which believed in Scotch philosophers, Doudan was perhaps predisposed to Anglo-mania. Without going into details, however, we may say that it is impossible to dip into these letters without finding admirable expression of acute thought upon life and general principles of criticism as well as

upon particular persons, mixed with personal sentiment which gives a charming impression of the writer's character. He belonged during his life to a class which he declares to be more common than is generally supposed, the "beaux esprits qui n'ont rien écrit." He holds, he says, with Gray, that there are many mute inglorious Miltons. These letters tend to show that the estimate formed of a man by his friends on the strength of his private manifestations may be more trustworthy than we are apt to take for granted. It is pleasant to assume that no talents are wasted; nor was Doudan wasted as far as his influence made itself felt through the channels of private intercourse; but we feel that he was a man who was so far wasted to literature that he might, if less fastidious, or less protected from fortune, have done some enduring work.

MAJOR RUSSELL'S TURKISH AND RUSSIAN WARS *

THIS is a very timely publication, and if it were translated into Russian or French, and circulated among the officers of the Russian army now mobilized on the borders of Turkey, we can imagine nothing better calculated to check any still existing war fever in that body. It is no discredit to any soldiers to shrink from a useless squandering of their lives, and never has any narrative brought out more clearly the awful waste of life in war, quite apart from the loss in actual fighting. It is now pretty well understood by those whose attention has been called to the matter, that the loss in war, even under favourable conditions as to food, clothing, and climate, arises far more from sickness than from the bullet, and that, instead of speaking of the soldier as food for powder, it would be much more correct to regard him as probably destined to end his life in a camp hospital, if not in a ditch; but for disproportion between losses in action and losses from disease, there have been few more striking and awful instances in recent times than the Russo-Turkish war of 1828-29. Not, of course, that the destruction of life came near that which happened in the retreat from Moscow; but in that case there was a sufficient reason for the catastrophe. Napoleon risked all on a chance, and it might have been predicted with certainty that, if compelled to retreat, his army must perish. But in the invasion of Turkey by the Russians in 1828 and the following year there were not apparently any conditions to make the attempt specially hazardous. The invaders chose their own time for making the advance; the weather was not unpropitious; the Russian army was well found and equipped, as things went in those days; while the Turkish army was in a state of extreme disorganization, and the resistance opposed by it was not more obstinate or intelligent than might have been anticipated. The causes which, notwithstanding these advantages, brought about the Russian disasters—for such must the result of the two campaigns be pronounced to be, although the honours of war rested with their side—are very clearly detailed in the work now before us. Major Russell takes his facts from the late General Chesney, who travelled over the scene shortly after the war, and from Von Moltke, who was attached to the Russian headquarters; but the intelligent criticisms given us in this interesting volume are his own.

The Russians crossed the Pruth in May 1828, the whole army available for operations, including the supports to come up later, being estimated at 120,000 men; but it seems doubtful whether more than 80,000 ever came into the first line of operations at one time. The Turks, however, had barely one-fourth of that number at starting, wherewith to oppose the invaders. The first mistake was in beginning so late in the season. In this respect military considerations had been subordinated to political. The Danube was crossed without difficulty, the Turkish commander adopting a Fabian system of tactics, and awaiting the invader behind the entrenchments of different frontier fortresses. The fortress of Brailow was taken in June, after a month's siege, the Turkish commander coming under strong suspicion of having sold the place. Varna surrendered, after a long siege, in October, a golden key having been used here also. But the fortified position of the Turks before Schumla was found impregnable, and the siege of Silistria had to be raised when, immediately after the fall of Varna, the Russians withdrew for the winter, leaving a vast number of dead behind them. "If we consider," says Von Moltke, "the enormous sacrifice that the war cost the Russians in the year 1828, it is difficult to say whether they or the Turks won or lost it."

Next year the Russians started again in May, Wittgenstein having been succeeded by his chief of the staff, Diebitsch; but the army was no stronger than in the previous year, the effectives available in the first line at starting being estimated by General Chesney at less than seventy thousand. This time, while Silistria was invested and Schumla masked, the Russian general advanced from Varna by his left. The Turks, issuing from Schumla, assumed the offensive, trying to fall on the Russian right rear, and a really desperate battle ensued, both sides fighting with determination; it ended, however, in a complete victory for the Russians. After this defeat the active opposition of the Turks may be said to have ceased, and Diebitsch might have occupied Schumla. He determined, instead, to press forward across the Balkans. There was only one thing that stood in the way of a march on Constantinople, and that was want of men. He had but 25,000 in hand. If only 10,000 were detached to watch the 30,000

men in Schumla, no more than 15,000 remained to cross the Balkans and penetrate into the heart of the enemy's country. Four weeks were therefore spent awaiting the arrival of the reinforcements set free by the fall of Silistria. But when Diebitsch set forward again he had probably at most not more than 35,000 effectives; for sickness was then making dreadful inroads on his muster-rolls. When a sufficient garrison had been left in Adrianople, there remained but little over 20,000 men wherewith to pursue the march to Constantinople. Thus it is that armies dwindle away. The position of the Russians was precarious in the extreme, and great exertions were made by the Emperor Nicholas to raise levies for its reinforcement. But, happily for the Russians, the bold policy proved here, as it so often does in war, the safest. The Turkish fears exaggerated the numbers of the advancing Russians, and the articles of peace were signed in time to save the gallant Diebitsch and his suffering but patient troops from a terrible disaster. For the sickness in his army had now attained to awful dimensions. No sooner, indeed, had the Russians entered the Principalities in the previous year than the plague broke out; but the plague was the smallest of the evils which beset this unhappy army. "Nervous, intermittent, and putrid fevers, dysentery, scurvy, and inflammatory disorders, prevailed everywhere, and destroyed ten times as many soldiers as the plague, which had hitherto been confined within narrow limits." It is estimated that during the first of the two years' war considerably more than 200,000 soldiers passed through the hospitals, of whom upwards of 80,000 died. This is exclusive of those—a very small minority—who were killed on the field of battle. It must be remembered, therefore, that the army which took the field the next year, and marched on Adrianople, was the remnant of that which thus miserably perished, reinforced of course very largely with fresh troops; and it says a great deal for the spirit of the Russians that, with this terrible foretaste of what would await them if the advance were repeated, they should have entered with such good heart on the second campaign. In the following May the plague again broke out, and raged with increasing violence, till at last in Varna alone the deaths reached as many as 500 a day. Everywhere the doctors tell victims almost to a man. The mortality was almost as excessive as in the previous campaign, and Von Moltke estimates the loss from disease in the second year of the war at 60,000 men. Altogether, then, about 150,000 men died in this war, in which there was only one pitched battle, and the towns were taken through the treachery of the defenders. As Major Russell well observes, "On reading the account of these horrors, the feeling naturally arises, what must have been the talent and determination of the general who was undeterred by them and still led his army on?" He goes on to quote the following description of him from Lord Albemarle's Diary:—

Field Marshal Diebitsch is a little fat, plethoric looking man, scarcely five feet high, with a large head, long black hair, and a complexion of the deepest sallow, and a countenance indicative of certain immortality of temper, which has earned for him from the troops, in addition to his proud title of *Vladika*, or *Crosser of the Balkans*, that of *Souvan*, or *Tea-Kettle*.

Of course the point of immediate interest in connexion with this war is to be able to determine how far the chances of success for Russia would be greater or less now in a similar invasion than they were in 1829. Russia has certainly a much larger army now mobilized on the banks of the Pruth than she had in 1828, and much better means of reinforcing it, at least up to the borders of its own territory; beyond that the break of railway gauge would appear to leave her dependent on cart and cattle transit, just as of old, supposing that the Turks have sufficient sense to remove their rolling stock out of the way. And the larger the army the greater of course becomes the difficulty of keeping it properly supplied. Then, although the Turks have certainly not displayed any military capacity in their war with Serbia, their army has comparatively improved much more than that of Russia, both as to numbers and organization, since 1828, when indeed it was in a state of extraordinary disorder and incompleteness, the Janissaries having been lately destroyed, and no adequate force established in their place. On the whole, it would seem that Turkey has made the greater relative improvement, and, if so, an advance on Constantinople would be still more difficult for the Russians now than it was in 1829. This comparison, too, leaves out of view the probable effect of sickness. The Turks are in fact protected as much by the detestable climate of Eastern Europe as by anything else. No doubt the hygiene of the Russian army was extremely defective in 1829; but there is no reason to suppose that it is at all perfect now, or that the heats of Bulgaria would not prove as destructive of Northern life as of yore. Major Russell calculates that under the most favourable circumstances ninety days must elapse after the passage of the Pruth before Constantinople is seriously threatened. Now the war, if it does take place, cannot really commence much before May; for when once the frost begins to break up, the roads become impassable till spring is fairly established. It must therefore be the middle or end of August before the Russians are before Constantinople, if the Turks should not be able to bar their progress; and the latter will have a potent ally in the heats of that season. The Russians, moreover, have no longer the command of the sea, while it must be very doubtful if another Diebitsch will arise to impress his strong will on the course of events. Lastly, it is now well known that Constantinople is capable of being made practically impregnable against an attack on the land side. Taking into account all these considerations—the certain loss, the financial embarrassment, and that, even if suc-

* *Russian Wars with Turkey*. By Major Frank Russell. 14th Hussars. London: Henry S. King & Co. 1877.

cessful in making her way to Constantinople, the probability still faces her that she may not be allowed after all to reap the fruits of her victory—Russia is certainly not without a full armory of reasons for wishing to find any honourable or plausible means of escape from the task which a few months ago she seemed ready to enter upon with light-hearted recklessness.

We have here been dealing only with the question of a Russian invasion of Turkey by way of Bulgaria; but, if war breaks out, the eastern side of the Black Sea will also be the scene of important operations, and some of the keenest observers of the existing state of things are of opinion that Russia will make her chief efforts in that direction. The possible outlines of a campaign in Armenia are discussed at some length by Major Russell; we have only space here to remark on the infatuation which possesses Russia, with her want both of population and money, to extend her Asiatic empire, when every mile of advance really makes her only the more vulnerable. So far from her strides eastward being a source of danger to our hold on India, we believe that England has only to hold up her hand and Russian sway east of the Caspian would crumble away like the sand of the Steppes over which it is now exerted. But this is not the place to develop so important a doctrine. We have only to add, in conclusion, a word of commendation on the carefulness and ability with which Major Russell has executed his interesting task.

LA LÉGENDE DES SIÈCLES.*

M. VICTOR HUGO'S new volumes show no signs of diminished power; they are indeed full of the extraordinary qualities which make their writer one of the most comprehensive poets that the world has seen since Shakespeare. In saying this we do not forget the faults of extravagance, immodesty, redundancy, and bombast which have disfigured some of M. Hugo's works. Poets who have written less or aimed at less than M. Hugo have attained within their limits a perfection which he will not pause in his rapid and sweeping flight to seek; and the French poet is at times wanting especially in that control which in Shakespeare tempers the rush of passion and produces sublimity without a touch of extravagance or an approach to the absurd. Yet, for vastness of conception, power of expression, variety of mood, and penetration of character combined, there are very few modern poets we can think of who rival M. Hugo. In his present volumes there are many instances of the grandeur and daring of thought which the poet can convey to his readers in words every one of which is full and eloquent; there are not a few examples of his biting faculty of satire and epigram; and there is a special development of that tender appreciation of the beauty of childhood which we may expect to see yet further developed in the forthcoming *L'Art d'être Grand-père*. In giving prominence to this, M. Hugo has shown a wisdom which does not always belong to poets in their old age. Instead of drawing upon the recollection of past emotions, he has written from present experience, and produced poems as tragic in their depth of pathos as his earlier works were in their fire and passion.

The volumes open with a poem called "La Vision d'où est sorti ce livre," in which the vastness of the poet's imagination is as evident and finds as full an expression as ever before:—

J'eus un rêve; le mur des siècles m'apparut,
C'était de la chair vive avec du grand bruit,
Une immobilité faite d'inquiétude,
Un édifice ayant un bruit de multitude.

Parfois l'éclair fai-ait sur la paroi livide
Luitre des millions de faces tout à coup.
Je voyais là ce Rien que nous appelons Tout.
Les rois, les dieux, la gloire et la loi, les passagers
Des générations à vau-l'eau dans les âges;
Et devant mon regard se prolongeant sans fin
Les fléaux, les douleurs, l'ignorance, la faim,
La superstition, la science, l'histoire
Comme à perte de vue une façade noire.

As the poet continues to look steadfastly at the vision, it becomes clearer; the chaos resolves itself into an order in which he distinguishes the past history of the world, until

sur la vision lugubre, et sur moi-même,
Que j'y voyais ainsi qu'au fond d'un miroir blême,
La vie immense ouvrait ses difformes rameaux:
Je contemplai les fers, les voluptés, les maux,
La mort, les avatars et les métamorphoses,
Et dans l'obscur taillis des êtres et des choses
Je regardais rider, noir, riant, l'œil en feu,
Satan, ce braconnier de la forêt de Dieu.

Then comes the shock of two opposing spirits, those of the Orestes and of the Apocalypse, for whose advent the heavens seem to make a way; and as they pass, the one crying "Fatalité!" the other "Dieu!" the vision trembles and breaks up: and, when it reappears again—

Ce n'était plus ce mur, prodigieux, complet,
Où le destin avec l'infini s'accouplait—

it was like a vast burying-ground, full of images of inevitable death and destruction:—

Seulement l'avenir continuait d'éclorer
Sur ces vestiges noirs qu'un pâle orient dore,
Et se levait avec un air d'astre; au milieu
D'un nuage où, sans voir de foudre, on sentait Dieu.

This is followed by a hymn of great beauty to "La Terre," in which we may note for their terse power of imagery the lines—

Et l'éclair front vivant qui, lorsqu'il brille et fait,
Tout ensemble épouvante et ras que la Nuit,
A force d'éblouissants sourires.

Then comes "Suprémacie," in which Vayou, Agni, and Indra, the gods of the wind, fire, and space, boasting of their limitless powers, are confronted by an apparition of light, who lays at their feet a blade of straw, and bids them exercise their strength on that. Vayou raises a tremendous storm, in which the whole universe seems to tremble, and Agni sets the world in flames, while the straw remains unhurt at their feet. Indra vaunts his power of seeing everything that exists:—

Lumière, je te dis que j'embrasse tout l'être
Toi-même, entends-tu bien, tu ne peux disparaître
De mon regard, jamais éclipé ni déçu!
A peine ent-il parlé qu'elle avait disparu.

"Entre Géants et Dieux" contains the defiance of the gods by one of the giants whose cave they approach, and "Les Temps Paniques," which describes the change under the rule of the gods from the simple levelness of life on the earth to a reign of terror in which three rivers, Styx, Alpheus, and Symphalius, fled underground, and in which

Les vagues voix du soir moururent "Oublions!"
L'absence des géants attrista les lions.

These two poems are followed by one of considerable length, called "Le Titan," which is full of beauty and power. The giant Pitos has been bound by the gods and shut up under Olympus. He ponders over his imprisonment, and with a sudden effort breaks his bonds. Then, digging a way with his strong hands, and breaking down all obstacles, he penetrates deeper and deeper into the earth, until through an opening he sees "l'autre côté monstrueux de la Terre." He sees by degrees spread out before him a whole universe of worlds—"des millions d'enfers et de paradis"—beyond them a limitless gulf, and

A travers l'épave d'une brume éternelle
Dans on ne sait quelle ombre énorme, une grande!

Then he burst suddenly among the gods laughing and feasting on Olympus, "et leur cria terrible: O dieux, il est un Dieu!"

It would be impossible, for want of space, to speak of every poem in M. Hugo's volumes, and from "Le Titan" we must pass on to "Aide offerte à Majorien prétendant à l'Empire," which is remarkable for its extraordinary dramatic force. In a dialogue of some thirty odd lines between two speakers, the poet conveys a singularly vivid impression of the irresistible force of the hordes which fill the plain in Germany where the scene is laid, and the revelation that their leader is Attila comes with admirable effect in the last line. "Le Romancier du Ciel," which takes up a good deal of the division of the book called "Après les Dieux les Rois," is written in a metre and spirit of which the first stanza may serve as an example:—

Vous ne m'allez qu'à la hache,
Quoique altier et hasardeux,
Vous êtes petit, roi Sanchez;
Mais le Ciel est grand pour deux.

The same idea is finely kept up throughout, but the work suffers, as do many others in the volumes, from the poet's habit of taking for granted that his readers are well up in the out-of-the-way names of Spanish legend which he must have collected with infinite pains. "Welf, Castellan d'Osbor," is a short drama in six scenes, which represents Otto III. of Germany, and other princes, accompanied by Pope Sylvester, offering every kind of honour and advancement to Welf if he will give up the gloomy tower which he is resolved to hold against them, and join himself to their forces. He refuses in a sombre and scornful speech; the tower is unassailable; the princes and their troops retire, but take up an ambush. A little beggar girl, cold, hungry, friendless, passes by and demands shelter. Welf lets down the drawbridge to take her in, and is instantly surrounded by his foes, while the crowd which has before adored him as a god heaps every kind of insult upon him. The dark grandeur of the forest and the lonely tower, the shallow splendour of the Empire, the infinite courage and tenderness of Welf, the different types of the tickle mob—all these are brought before the reader's mind with a marvellous art and concentrated power. Perhaps the least happy of all the poems in the two volumes is "L'Angle du Casque," which comes soon after "Welf." This is a combat between Comte Angus and Lord Tiphaine of Scotland; and among other strange facts which come out in the course of the poem, it may be noted that Hecla is plainly visible from Lord Tiphaine's domain in Scotland. There is an irresistible sense of incongruity and absurdity about the whole work, and the end, which aims at a sublime terror, is nothing but childish. Tiphaine pursues the young Count in a chase conducted on the gigantic scale in which M. Hugo delights, and finally kills him, upon which the brass eagle on Tiphaine's helmet takes all nature to witness that Tiphaine is a bad man, and tears him to pieces.

"L'Épopée du Ver," with which the second volume opens, is charged with a biting eloquence and fire, and its gloomy tendency is relieved by the address from the poet to the worm which follows it. The poem is, however, disfigured here and there by images which are somewhat too revolting. One stanza, which brings out the writer's power of satire, may be quoted:—

C'est parce qu'un ma nuit j'ai mangé vos victoires,
C'est parce que je suis composé de vos gloires,
Dont l'éclat retentit
De toutes vos feries, de toutes vos durées,
De toutes vos grandeurs tour à tour dévorées,
Que je reste petit.

"Masferrer" is another form of the idea expressed in "Welf," with a different conclusion. The three finest poems in the second volume, and we are disposed to think the most perfect in the whole collection, are "Le Cimetière d'Eylau," "Guerre Civile," and "Petit Paul." The first of these conveys with extraordinary force and vividness the story told to the writer by his uncle of the battle in which he, with a hundred and twenty men, kept the cemetery which was the pivot of the contest. The recital is full of keen touches of character as well as of magnificent description. After hours of steadfast opposition to shot and shell,

Soudain le feu cessa, la nuit sembla moins noire.
Et l'on cria : Victoire ! et je criai ! Victoire !
J'aperçus des clartés qui s'approchaient de nous.
Sanglant, sur une main et sur les deux genoux
Je me traînai : je dis :—Voyons où nous en sommes.
J'ajoutai :—Debout, tous ! Et je comptai mes hommes.
—Présent ! dit le sergent.—Présent ! dit le gamin.
Je vis mon colonel venir, l'épée en main.
—Par qui donc la bataille a-t-elle été gagnée ?
—Par vous, dit-il.—La neige était de sang baignée.
Il reprit :—C'est bien vous, Hugo ? c'est votre voix ?
—Oui.—Combien de vivants êtes-vous ici ?—Trois.

In "Guerre Civile" the crowd has seized a soldier, who replies to their insults with calm contempt, and walks disdainfully among the bodies which he himself may have shot down. He is being hurried to death when

Un enfant apparut. Un enfant de six ans ;
Ses deux bras se dressaient suppliants, menaçants.
Tous criaient :—Fusillez le mouchard ! Qu'on l'assomme !
Et l'enfant se jeta dans les jambes de l'homme.
Et dit, ayant au front le rayon baptêmeux :
—Père, je ne veux pas qu'on te fasse de mal !

The child refuses to leave his father, who persuades his captors to pretend that they are taking a friendly walk, and sends his son home reassured—

Nous sommes à notre aise à présent, tuez-moi,
Dit le père aux vainqueurs ; ou voulez-vous que j'aie ?
Alors dans cette foule où grondait la bataille,
On entendit passer un immense frisson,
Et le peuple cria : Rentrez dans la maison !

In "Petit Paul" is found the full expression of that depth of tenderness and pathos of which we have spoken above. The motive of the poem—the cruelty of a stepmother to a child who has been his grandfather's idol—has been often taken before ; but it may be doubted whether the intensity of pathos with which M. Hugo has treated it has ever been approached. To remove any line from its proper place in a poem so perfect as this is perhaps audacious ; but, for the sake of one expression, we cannot resist quoting these four lines describing Paul in his stepmother's house :—

Il prenait dans un coin, à terre, ses repas,
Il était devenu muet, ne parlait pas,
Ne pleurait plus. L'enfance est parfois sombre et forte.
Souvent il regardait lugubrement la porte.

What the catastrophe of the poem is may be guessed from this—the tragic beauty of its expression by the poet cannot be imagined without reading it.

SELLAR'S VIRGIL.*

THIS book is an attempt to gather up and present in a comprehensive form what is known and has been said about Virgil and the influences under which he wrote. Mr. Sellar's former volume had given good hopes that he would undertake this great labour and perform it well ; and we have to thank him for a volume which, after all deductions, is the most important effort that has yet been made to interpret Virgil for modern readers. Sainte-Beuve's well-known *Étude* was at most a study of the *Æneid* ; and, full of charm as it is, it leaves even on the *Æneid* much to be said. The great French critic knew too much of literature in general to know any department exhaustively. Conington, too, in his edition had above all things to edit, and from the nature of the case his criticism is a criticism of details. Mr. Nettleship in his *Suggestions*. Mr. Green in his little *Virgilian Study*—these and many other short essays had really only pointed the way to a larger work that might include them all. And indeed the last charge that any one would bring against Mr. Sellar's volume is that it is not large enough. The table of contents is a massive piece of work, with its eleven chapters and their careful divisions and subdivisions, exhausting Virgil's life, his poems one after another, his place in Roman literature and in the world's estimation. There is abundant industry and care here at least, whatever may be thought of the work in other respects.

As is fitting in a volume which professes to be only the first of two that are to give a complete account of all the Augustan poets (and so to continue his former work on the *Roman Poets of the Republic*), Mr. Sellar begins with a full-length review of the Augustan age in its literary aspect. Without much pretence of independent research, he deepens and widens the received idea of that age by bringing to bear upon it all that has been recently said on such subjects as the deification of the Emperor, the sentiment of nature, and the influence of Alexandrine poetry. English readers who are not professed students have in this gene-

ration taken their impression of the Virgilian circle mainly from Dean Merivale ; but Dean Merivale's account of the influences at work was written twenty years ago, and took little account of the labours of foreign scholars. What Jahn has said of the fine art of that time, of the Livian statue of Augustus, of the cameos and other gems ; what Helbig has said of the influences which made Pompeii beautiful—this is the kind of information that Mr. Sellar has striven to embody. His view is that the literary men who represent to us the Augustan age—*novi homines* one and all, and thus opposed to the whole sentiment of the literary men of the former generation—were the result partly of the general enthusiasm in favour of peace and order, manipulated with wonderful skill by the Emperor and his minister, partly of the unprecedented accumulation of wealth in Rome, and partly of a peculiar literary culture derived from Greek artists and Greek writers of an age when the bloom was gone. And the reasons for the sudden development of poetry rather than of the more native "oratory, history, and didactic disquisition" are in their turn to be sought for in the circumstances of the time. Despotism destroys political eloquence, and, if it chooses, can destroy history and political speculation. But poetry, as Edgar Quinet has said, "is the last form of literature to wither under a despotism," though it withers not the less certainly in the end. In the case of the Augustan poets, not only had the mechanical difficulties of their art been overcome in the preceding age, but an idea of dazzling splendour was present to their minds, and for one short generation the Empire was a thought not of "dull oppression," but of "inspiring novelty," to men full of a sense of the new possibilities opened for Italy and Rome, and full of the new taste for Greek letters.

Before turning to Virgil's poems in detail, Mr. Sellar spends two well-filled chapters on the poet's place in Roman literature and on his life. On the latter subject nothing very new is added to what criticism had before extracted from Donatus and the other biographers, and from Virgil's own references to himself and his contemporaries' allusions to him. But the author has put out all his strength in the former chapter, which contains not only a sketch of the history of Virgil's reputation, but Mr. Sellar's own views of Virgil as a "representative" poet, and as one of the great poets of the world. Some interesting remarks precede these more dogmatic sections ; for instance, where the decline in Virgil's fame during the century before 1850 is partly accounted for by the saying that Voltaire and the French of his day "were interested in other ages in so far as they appeared to be like their own," while the modern critic "feels an imaginative interest in nascent or obscure civilizations"—in other words, is interested in other ages in so far as they are unlike his own. Hence Virgil, in an age like that of our fathers, is likely to be obscured by Homer, who, besides the ineffaceable charm of originality, has the *mille annos* which make all the difference between an age that stimulates modern curiosity and one that echoes the modern time. The beginning of this century, Mr. Sellar also reminds us, was an era when men desired "to escape from the exhausted atmosphere of literary tradition, and to return again to the simplicity of nature and human feeling." Hence the great English and German poets who characterize that time are men who draw much from Greek sources, and very little from Roman, the genius of which is "more in harmony with eras of established order and of adherence to custom."

But now that, as we regard it, a healthier and more scientific spirit has come into existence than either the spirit of conventional admiration or the spirit of conventional depreciation, the world begins to turn back to Virgil with an interest as strong as that of Addison and Voltaire, though its grounds may be different. Not because he is the rival of Homer in "the inspired poetry of heroic action," but because he is, in the first place, the embodiment and representative of all that is great in the Roman Imperial idea and in Roman culture, and, in the second, the supreme example of a peculiar type of imagination, and one of the greatest masters of style in literature, Virgil has definitively taken his place as the chief of Roman writers, and as one of the four or five great poets of the world. To how many has it been given to seize and sum up, and present in the perfect manner of the great artist, the very essence, the vital spirit of their age, and that age one of the decisive ages of the world's history ? Whether such an age is like or unlike our own, the modern judgment on such an achievement must be that the man who does it is one of the great ones of literature ; nay, if we are to have comparisons, that he who with all the pleasure-giving skill of the artist presents an idea so varied and comprehensive as the Roman idea, is hardly less, in spite of the *mille annos*, than the poet of the *Iliad*, with its picture of elementary human passions and its simple story. Mr. Sellar takes great pains to show how this "representative" character belongs to Virgil ; indeed the sections in which he tries to demonstrate this may be called the central sections of his book, determining as they do the lines of the more detailed examination of Virgil's separate poems that follows. The poet represents, he says, the idea of the destiny and genius of Rome ; the sentiment, newly rising into prominence in his day, of Italy as one country and the common home of Rome's best beloved children ; the political feeling of the time, when "faith in the Republic had become impracticable" ; the tenderer religion of the time, when *pietas* meant both "piety" and "pity," both love to God and good will towards men ; the learning of the time, philosophic, antiquarian, sacerdotal ; the art of the time, with its too careful study of Greek models, its over-reflectiveness, its perfection that had within it a seed of decay.

* *The Roman Poets of the Augustan Age.—Virgil.* By W. Y. Sellar, M.A. Oxford: at the Clarendon Press. 1877.

The separate examination of each poem, into which our space does not allow us to follow Mr. Sellar, is a development of this view of Virgil.

It is difficult to select characteristic passages for quotation from Mr. Sellar's book, though here and there we come upon a passage where the thought is singularly definite as well as true, and is expressed in a crisp and clear manner. For example, of the two aspects of Nature which the Georgics and the Eclogues present:—

'In the Georgics, the sense of the relation of Nature to human energy imparts greater nobleness to the conception. She appears there, not only in her majesty and beauty, but as endowed with a soul and will. She stands to man at first in the relation of an antagonist: but, by compliance with her conditions, he subdues her to his will, and finds in her at last a just and beneficent helpmate. In the Eclogues she takes rather the form of an enchantress, who, by the charm of her outward mien and her freely-offered gifts, fascinates him into a life of indolent repose. If the one poem may in a sense be described as the "glorification of labour," the other might be described as the "glorification of the *dolce far niente*" of Italian life.

Or, again, of the likeness and yet contrast between Virgil and Lucretius:—

The secret of the power of Lucretius as an interpreter of Nature lies in his recognition of the sublimity of natural law in ordinary phenomena. The secret of Virgil's power lies in the insight and long-practised meditation through which he abstracts the single element of beauty from common sights and the ordinary operations of industry.

But we can hardly say that the general effect of the book on the reader is that which is produced by passages so clear as these. For the most part, the four hundred pages in which Mr. Sellar has treated Virgil lay him open to the charge of diffuseness, of dwelling too long upon the obvious, of going too little below the surface. For example, the section from which we have quoted the former of the two passages, the section on "Truth of Feeling in the Eclogues," is twice as long as it need be, and some of the remarks that introduce it tremble too near the verge of commonplace to be admissible in a writer of Mr. Sellar's powers. No doubt to write a really effective book upon Virgil is one of the most difficult tasks a man can set himself; the poet is far too well known for the world to tolerate anything but the most exceptional treatment of him. The keenest historical imagination, the power of receiving and communicating a perfectly definite impression, a horror of "vain repetitions"—these are indispensable qualities to the critic whose opinions of Virgil are in any way to be accepted as final. If Mr. Sellar does not possess all these qualities, he certainly possesses adequate learning, although his book contains no history of Virgilian manuscripts or of Virgilian emendation; and he has a methodical way of going to work which produces its effect. The result, as we have said, is that he has written the most comprehensive book on Virgil that exists in English. But whether it is to be accepted as the best and last word that criticism has to say upon Virgil is another question.

THE CITY OF SUNSHINE.*

IT would be little to the purpose to compare this tale with the ordinary novels about India. With one or two striking exceptions, even the good ones among them seldom rise above the level of mediocrity; they might pass for third-rate productions of the London season, with a tiger hunt, a badminton party, and a view of the Snowy Range thrown in, by way of local colouring. *Their India* is simply Belgravia with a turban and *chuddur*. This, however, is a real tale of India, by a writer who thoroughly understands his subject. At the beginning of the story we are shown the villagers of Dhupnagar working themselves into a state of excitement about the apostasy of Krishna Chandra, son of Ramanath Gossain, the owner or hereditary guardian of the local temple and its far-famed miraculous *linga*. If it were a vile *Sudra* whose morals and religion had been spoiled by the foreign kine-eaters of the Calcutta University it would have mattered little; but a high-born Brahmin, the destined guardian of the *linga*, it was horrible! The chief men of the village—Three Shells, the moneylender; Prosunno, the lawyer; and Gangooly, the gossiping, consequential, good-natured headman—are hit off very cleverly; and there is also humour in the account of how the opposition were induced to consent to the prosecution, for the simple reason that they were deep in the books of the moneylender, who was in love with Radha, with whom Krishna was in love. The perplexity of the villagers is extreme; for what would become of their pilgrim traffic if the Gossain left the village, taking the *linga* with him? The question, however, was settled in the temple grounds, whether the sly villagers had deputed their two most unpopular members, the lawyer and the moneylender. With the prompt sarcasm for which he is often distinguished in the course of the story, Ramanath silences the lawyer, who had himself been taught by the kine-killers; and he disposed of Three Shells by telling him a story. Two years ago, said he, a Brahmin pilgrim lay dying of hunger and thirst in the pagoda tope close by. In his last moments he revealed to the priest the fearful crimes of which he had been guilty. He had come from Lootna—"a place you may perhaps have heard of. But what ails you, Three Shells? You look as if you were going to faint. The sun is too strong for you. Sit a little further back into the shade, man." "He had led a terrible life had that Brahmin," continued the priest, "but he told me of an accomplice who was even more steeped in crime than he was. This person was—" "Dog and son of a

dog," exclaimed Ramanath, starting to his legs, as Three Shells with a howl of despair prostrated himself before him, and attempted to kiss his feet, "pollute not with your unhallowed lips the feet of a pure Brahmin. Back, wretch, lest I blast thee with a look." As the Mahajun sneaked out of the compound, Ramanath informed him that he had placed a sealed copy of the above little story in the hands of a trusty friend, who would deliver it to the English magistrate "in the event," said the priest drily, "of anything unusual happening to me—that is, if I were to be suddenly found dead, or the like." Dhupnagar was cheated of its punchayet; but the reader anticipates how necessary the possession of the packet, and the priest's death, have become to the moneylender's peace of mind. His villain, Mohun, will strangle Ramanath; for Three Shells himself "cannot carry another priest on his conscience"; and then he will poison Mohun, "for there can be no sin in putting such a scoundrel out of the world"; next he will foreclose the mortgage on the spendthrift Rajah's property; then tempt the proud Kristo to give him his daughter, as a reward for remitting his debts; and, finally, he will die a Rai Bahadur, after having won the favour of Government by his contributions to district roads and female schools. But to return to Ramanath. Without concealing his grief, he received Krishna with all the old tenderness. He bided his time. He never expostulated with him in a way to arouse his pride or rekindle his enthusiasm. The old man was also master of a kindly satire which even a stronger apostle than Krishna would find it hard to resist. But the priest's surest weapon was his son's love for Radha. How could an out-caste marry her, or support her if he did; for Ramanath's wealth morally, if not legally, belonged to the temple, over which an apostate never could preside. Ramanath left the young enthusiast to brood in solitude. He cut off his supplies of vanity—refused him the gratification of martyrdom. It was most humiliating. Did not the Calcutta mob stone Mr. Chatterjee when he turned Christian? And yet the blockheads of Dhupnagar considered Krishna Chandra Gossain—the crack student of his year—too insignificant for lapidation:—"In fact Krishna felt quite angry with the latitudinarianism of his townsfolk, and began to think there would be but small benefit in teaching them a new faith when they cared so very little for their present creed." But perhaps Krishna found some consolation in the martyrdom of his final surrender. The only drop of bitterness in Ramanath's cup of happiness was the necessity of sacrificing the happiness of his beloved daughter-in-law Chakwi, whose chances of winning Krishna's affections would vanish on the introduction of a second wife. For Ramanath was tender-hearted; he could never bear to see a woman cry—so very unlike his "dear father—peace be with him!—who would beat his wives until the Zenana rang with wailing, like a burning-ghat at burial-time."

The chapters on Krishna Agonistes are a good delineation of the conflict and interplay between passion, worldly interest, and high ideals. They also contain many vivid sketches of Hindoo domestic life. Especially striking is the picture of the haughty, high-born Radha, stately and beautiful as an Apsara from Indra's heaven, and with her secret scorn for the bookish, sheepish youth to whom the elder folks are about to transfer her like a parcel of goods. But the Fates spoiled Ramanath's little plot. In the dead of night Krishna overheard an impassioned conversation between her and Afzul Khan. We are told that the stone wall of Radha's garden gave Krishna more support at that moment than the two million and odd gods of his fathers; and that Krishna broke off the match without assigning any cause. We are now in the thick of Mr. Allardyce's plots and counter-plots. By the machinations of Preenath, the untive deputy magistrate, Radha's third and last lover, Afzul Khan—the handsome, wild scapegrace—was put under lock and key on the charge of having shared in certain robberies which had lately taken place, one of them at Radha's father's house. Then comes a characteristic scene of Hindoo superstition, in which poor Chakwi visits a witch, from whom she procures a love-philtre wherewith to subdue Krishna. Afzul's father is also there—his object being to poison his son, so as to save him the disgrace of hanging, or of transportation, which is worse. Radha's passionate grief over the dying Afzul is described with great force. Afzul, however, came to. He had swallowed the wrong dose. It was Ramanath Gossain who accidentally drank the mixture intended for his son, and in a few hours his funeral pyre lighted up the waters of the Gungapootra, whilst Three Shells greedily listened to the sound of wailing, and watched the smoke with ferocious delight glancing in his rat's eyes. But a fate as tragic and sudden soon fell on Three Shells himself. For, scorning her country's conventionalities, and throwing her old pride to the winds, Radha breaks in on the court assembled to try Afzul, and explains the true cause of his presence in her father's compound. And, to crown all, the robberies were there and then brought home to two professional thieves in the moneylender's secret employ, by Mr. Romesh Chunder Roy, who, having been sent by the Calcutta Brahmoists to examine into the facts of Krishna's apostasy, had discovered certain secrets of Dhupnagar life. Three Shells died; and next day he lost his path in the jungle. His wild flight from a tiger was arrested by a precipice at the foot of which stood Afzul and another pursuer. The brute seized Three Shells, who clung to the edge: a shot brought them to *terra firma*; and the two man-eaters speedily perished in each other's embrace. Afzul, of course, married Radha; and Krishna forsook the Empyrean and Saraswati, the Goddess of Wisdom, for his ancestral acres and Chakwi.

The Mahajun's death, no doubt, looks sensational, and its cir-

* *The City of Sunshine*. By Alexander Allardyce. 3 vols. Edinburgh and London: Blackwood & Sons. 1877.

circumstances of time and place seem rather improbable; and it might be plausibly urged that the development of the story depends on an unaccountable sin of omission, and an improbable sin of commission. But, apart from this, the story presents an interesting picture of Hindoo life and character, though perhaps Anglo-Indians alone will fully appreciate its fidelity. How appropriate to the man and the occasion is the attitude of Bejoy, the match-maker, as, with his head on one side, a flower daintily held to the tip of his nose, his eyes half-closed, and a phlegmatic smile on his countenance, he stands listening unperceived outside a group of villagers gossiping about the Krishna-Radha business! All through the story Bejoy is just the man whose soul, in a past stage of his existence, might have inhabited the body of a cat. His step is feline. When pleased, he utters inarticulate sounds like the purring of a cat. You almost expect him to rub himself against your legs. To look at him, "you could have almost sworn he had made his toilet by licking himself only half an hour before." The most amusing character in the story is Mr. Roy, the barrister and ex-Templar, whose eccentricities and irreverent remarks on the holy cow so horrified the simple folk of Dhupnagar. Then there is Ramanath Gossain, whom one loves to imagine sitting cross-legged in his temple-porch, as he contemplatively smokes his hookah, after the rosy dawn, and in the dreamy eve; the fine old priest, with his shrewd notions on men and things, his kindly, dignified, and persuasive ways, but withal his quiet, dry sarcasm for the hypocrites rash enough to provoke it. Ramanath is the best type of the old-fashioned Hindoo; just as Krishna and Mr. Roy and the "Dipty" (Deputy-Magistrate) are respectively exact types of revolutionary or Young Bengal; and all four ought to be studied in conjunction. Mr. Allardye makes his Baboos personally interesting in spite of their meanness, their duplicity, or their shallow conceit. It would be absurd to feel angry with Mr. Roy; his unflinching good humour and self-possession disarm your resentment at his amazing impudence; and you can only laugh at him when, after a snubbing that would settle most men, he walks cheerily off, whistling a cockney air and twirling his gold-headed cane. Next to Ramanath and Krishna, the best-drawn character is perhaps Agha, the Khyberlee, the rough, wild, yet tender-hearted Orson, who seriously thought of slaying an infidel or two by way of invoking the compassion of Allah on the imprisoned Afzul, but who finally decided on trying a pilgrimage to the tomb of the holy saint, and began his prayer in the following blunt and straightforward sentence:—"Oh blessed Pir Murtaza Ali Khan, an Afghan yourself, and knowing how difficult it is for an Afghan to do right, have mercy on the vilest and humblest of your slaves." And then, after denouncing himself as "worse than a dog of dirt and a cat of clay"; "worse than the Nawab of Panch Pahar's little, brown, spavined gelding"; and "worse than the rotten old rock that lies between Dhupnagar and Milkiganj, on the banks of the Gungapootra," he concludes:—"Wherefore, Oh blessed Pir Murtaza Ali Khan, seeing that thou art so holy, and I am so vile, do what is needful. What use of more? Amen." The description of Agha's ruminations on the unsatisfactory order of things in general is highly humorous. Another agreeable characteristic of Mr. Allardye's work is the absence of any appearance of effort. Only in one instance is a description overdone:—

The Gungapootra came gliding slowly down to the bottom of the valley, sweeping with its waters now the one side now the other, as the robes of a queen are tossed from side to side as she paces the palace hall; throwing up huge mounds of silt as it slowly doubles the corner of Milkiganj, &c.

The simile is quite in the Oriental spirit; but the abruptness of the transition from pictorial drapery to alluvial deposit almost suggests the substitution of silk for silt.

PRINCE HENRY THE NAVIGATOR.*

THE painstaking and accurate author of this work has put before himself a very distinct issue. He is not exactly engaged in a process of rehabilitation. He is determined, if possible, to show that the splendid maritime achievements to which we owe the discovery of America and Australia, the sea route to India, China, and the Moluccas, and the circumnavigation of the globe, all compressed into a century, were in reality due to the imagination and perseverance of a single man. As the great-grandson of our own Edward III., as the grandson of John of Gaunt, as the son of his daughter Philippa and of João, one of the best kings that ever sat on the throne of Portugal, Prince Henry, termed "the Navigator," has a special claim on the respect and remembrance of Englishmen. This Prince was born, fortunately, at a time when the world had just begun to wake up from a long slumber, and Mr. Major has shown, by a good deal of research, how King João vanquished the Spaniards in the battle of Aljubarrota, formed an alliance with England, forced the Mussulmans to evacuate the town and citadel of Ceuta, and then allowed his sons, more than one of whom were men of eminence, to give that attention to travel and maritime exploration which in so short a space enlarged the whole horizon of politics, science, and trade. We do not make out that Prince Henry is entitled himself to take rank as a discoverer. What

Mr. Major claims for his hero is that he successfully stimulated and directed the energies of his own and other races; that, on the bleak promontory of Sagres, swept by the winds of the Atlantic and unrelieved by vegetation, he passed years in studying imperfect maps, and in perfecting inadequate instruments; that, by a judicious liberality, he ensured to his country the services of able seamen of all nations; and that, in a life of less than seventy years, he fairly placed Portugal for a time at the head of the pioneers of the world. We admit that the author has made out a very good case, and we may say of his work, as a literary production, that it tells us a great deal in a moderate compass. If the narrative has occasionally a dry antiquarian flavour about it; if the pages teem with such names as Pedro and Diego, Perestrella, Balhazar, and Bartosa; if there is a certain sameness in the accounts of stormy Capes, furious seas, low lines of coasts fringed with palm-trees and cultivated by hostile Moors or tattooed and suspicious negroes, these characteristics are only what we must expect. But the author is never grandiloquent, never loses sight of his premises and proofs, and never writes for effect; and now and then, in his descriptions of strange customs and gesticulating and naked combatants, there is a freshness and a simplicity which take us back to Herodotus and Defoe.

There is, of course, a family likeness in all the experiences of these hardy seamen; and the Portuguese, being good Roman Catholics, seem to have been honestly actuated quite as much by the hope of introducing Christianity among barbarous tribes as by a thirst for new conquests. Wherever they landed they appear to have first planted the standard of their country, and then to have carved a cross. Their next endeavour ordinarily was to win over some of the negroes and carry them back to Portugal. But these benevolent motives were not seldom misconstrued, and there are one or two ugly stories of artifices resorted to by the explorers which were met with forcible retaliation by the natives. Barrenness of results only appears to have had the effect of sharpening invention and furnishing fresh incentives to energy; and, with all our modern amplitude of resources and wealth of knowledge, we must admire the courage and skill which carried frail ships, provided with unscientific instruments, round dangerous Capes and over tempestuous oceans in safety to their unknown ports. Indeed this book has more than once reminded us of Macaulay's warning against the habit of looking at ancient transactions by the light of modern knowledge, and of boasting that we all know that there is a place called New Holland, while both Columbus and Gama went to their graves in ignorance of the fact.

We shall endeavour to condense some of the chapters in which Mr. Major shows how, step by step, the Portuguese crept along the vast coast of Africa, got past the Cape of Good Hope, and eventually founded an empire in India, where their career as explorers ended and that of administrators did not begin. There is an old tradition that Madeira was really discovered by an Englishman named Machin, who fell in love with a young lady of good family, carried her off in spite of her parents, was driven to the island in an attempt to evade pursuit and reach France, and died there with his mistress, the survivors just managing to reach the coast of Africa, where they were taken prisoners by the Moors. This book shows that one of Machin's crew, a Spaniard named Juan de Morales, was ransomed by Spanish intervention, and eventually found his way into the service of Prince Henry, who sent out one of his navigators, Gonsalves Zarco, to re-discover the island and colonize it for Portugal. The name of the Englishman Machin is still retained in a part of Madeira called Machico, while Funchal, we are told, is derived from the Portuguese *Funcho*, or fennel, with which the place abounds. We like to hear of the contemporaneous account of abundant water and wood, of the jackdaws and the sea-wolves which gave their names to places either in Madeira itself or the lesser island of Porto Santo; of the introduction of the sugar cane, and of those celebrated vineyards which, though they recently have ceased to fill our cellars, only thirty years after their introduction displayed bunches of three or four palms in length, which to a Venetian navigator appeared "the most beautiful sight in the world" and of a prolific rabbit, which littered so copiously that her descendants ate up all the vegetable cultivation and became a positive pest. But it rather taxes our faith to believe that when certain dense forests in the interior of the island were set on fire, in order to save labour and to clear a passage, they continued to burn unextinguished for the space of seven years. After the discovery of Madeira a great deal of time and labour was spent in doubling Cape Bojador, exploring the country of the Tawny Moors, passing the Senegal, moving southwards along the Gold Coast, and preparing the way for the triumphs of Dias and Gama. The author takes occasion to show clearly that the group of the Azores, though marked on an early Genoese map of 1351 found in a library at Florence, were not known to the Portuguese at all till 1432, nor colonized till some years subsequently. And there seems to be some controversy as to the precise date of discovery between the Flemings and the Portuguese, into which we do not care to enter; but we may remark that Mr. Major effectually explodes the tradition about an equestrian statue, with letters in the Phœnician or some unknown language, which pointed to the existence of a new world across the Atlantic.

Passing over these topics, we come to the remarkable enterprise of the Venetian Cadamosto. This gentleman, when only twenty-two years of age, had the luck, owing to contrary winds, to make the acquaintance of Prince Henry, who helped to fit out

* *The Discoveries of Prince Henry the Navigator, and their Results.* By Richard Henry Major, F.S.A., Keeper of the Department of Maps and Charts in the British Museum, &c. London: Sampson Low, Marston, & Co. 1877

his ship and sent him to report on Madeira and Porto Santo, and to push his way still further south. In the space of some thirty-seven years since their discovery the islands had made a marvellous progress. Goats, wild boars, and rabbits, as we have already said, were abundant. There was wheat enough for consumption and for export. Wood of great elegance and fragrant was made into furniture, which was sent to Portugal, and Madeira could boast of eight hundred men, of whom one hundred were mounted. Then we have an interesting account of a native potentate who possessed the country fifty miles south of the Senegal, and to whom the Portuguese gave the odd title of Budomel. This worthy had nine wives in one place, and more or less in others, and was respected by his subjects, not for his rank, but for his riches and for "personal strength, sense, justice, courage, and good looks." He kept up great state, only showing himself to his subjects for one hour in the morning and a short time in the evening; and he allowed no one, not even his relatives, to approach him except on their knees and with their foreheads on the earth, something like the fashion countenanced in Burma. The climate, we are not surprised to learn, was too hot for cereals or vines; but there was plenty of oil and palm-wine, as well as of serpents, white ants, and animals of various sorts. Horses imported from Barbary could not stand the "extreme heat," which "soon killed them"; but we are inclined to impute the mortality, not to warmth of climate, which favours the high-spirited Arab, but to "unsuitable food, such as beans and millet. South of Prince Budomel's country was the Gambia, and up this they proceeded some way, but returned after an encounter with the negroes which reads very like a page or two of *Robinson Crusoe*. In a second voyage their motives were better appreciated, and Cadamosto proceeded some sixty miles up the Gambia, to the region of Batti Mansa, or King Batti. Fever compelled him to return after a stay of eleven days; but he tasted elephant's flesh, and thought it hard and disagreeable; saw some hippopotami, and wondered at a habit, unknown elsewhere, of eating dog's flesh. About this time another captain, one Diego Gomez, went much further up the same river, or nearly five hundred miles, and feasted the sovereign, Nominansa, in return for divers civilities, with fowls and meat and white wine and red, to such an extent that the guests said to each other that "no nation was better than the Christians." We own to feeling an interest in this potentate, and in his wish for baptism; in his amusement at learning that the Christians carried on their wrists a bird which could catch and kill other birds; and in his longing for some rams, sheep, geese, and a pig; as also for two men "who could construct houses, and make a survey of his city." But the narrative says little more on this subject except that, some two years afterwards, Prince Henry sent a certain abbot, a relative of a cardinal, to remain with Nominansa, and instruct him in the true faith.

When Prince Henry died and was buried in the monastery at Batalha, in a tomb which, by reason of its exquisite design, "we are to believe eye-witnesses, is alone worth a journey to Portugal, discovery sustained a check for a time. But the race of enterprising navigators was not extinct. King Alfonso, as the author spells his name, leased the African trade for five years to Fernam Gomez, with the exception of ivory, stipulating with excellent forethought, that the lessee should be bound to discover annually one hundred leagues of coast. This gentleman, who must not be confounded with another of a similar name, also discovered what we call the island of Fernando Po, fitted out an expedition which opened up a trade in gold dust, discovered the island of St. Thomas, and was the first to cross the equator. All this enabled Fernam to amass great wealth and render good service to the King, who granted him a coat-of-arms, *argent*, three negroes' heads collared, or, with rings in their ears and noses. These expeditions doubtless prepared the way for the final triumph of Bartholomew Dias, who actually rounded the Cape of Good Hope without knowing it, reached Algoa Bay, to which he gave the name of Santa Cruz, and returned home, owing to the exhaustion of his crew in mind and body, after an absence of just sixteen months and seventeen days.

Mr. Major judiciously abstains from dwelling at length on such a comparatively well-known story as the voyage of Columbus; but he draws attention to the fact that that great sailor made several voyages to the Guinea coast in the Portuguese service, and married the daughter of a gentleman in the household of Prince Henry, whom that Prince had made Governor of Porto Santo, and who is credited with the introduction there of the progenitrix of all the rabbits. This book reminds us how it was that the proposal of Columbus to discover India by going due west did not meet with favour at the hand of King João; but, for the purpose of this work, it may be conceded that the Genoese navigator deduced his inferences from facts supplied by Portuguese pilots, and gathered in trips to Madeira or the Guinea coast. The fame of discoveries in the East and South, Mr. Major, in the concluding part of his work, fairly apportioned between Cabral, De Gama, and Albuquerque on the one hand, and Magalhaens and his comrades on the other. De Gama, stopping at various points on the west and the east coast of Africa, and at Madagascar, then known as the Island of St. Lawrence, sighted the high land of Southern India, near Calicut, after a voyage of more than ten months, and there is a grim and prophetic irony in the first salutation which greeted the adventurers. "The devil take you for coming here; what brought you from such a distance?" The reply, too, sounds oddly enough:—"We come in search of spices and Christians." We must leave readers to note how the torch

of discovery was handed over unquenched by De Gama to Cabral and to Almeida, the first Viceroy of the Indies, and how these and others discovered Brazil, Ascension, and St. Helena, explored a part of Ceylon, already known by accounts sent overland, and at the beginning of the sixteenth century pushed eastward to the Moluccas and China. It is almost humiliating to think that out of what might have been a noble inheritance, transmitted by a nation which then outstripped our own in boldness, nothing is left but a strip of country on the west coast of India bearing testimony to departed greatness, some three or four wealthy mercantile families long established at Calcutta, a Portuguese church or two at Hooghly and at Agra, and a motley assembly of humbler persons who perpetuate the high-sounding names of De Souza, Gomez, Almeida, and Gonsalves, and discharge the useful but not very elevating functions of clerks and copyists in Government offices at the Presidency towns.

The last chapter in the book is devoted to Magalhaens, who, when only twenty years old, had been in the retinue of the first Portuguese Viceroy of the Indies; and how he started on an expedition equipped by Charles V. of Spain, quelled a mutiny on the coast of South America, went through the Straits on which he has bestowed his name, reached the Philippines, and died in a fight with the natives at the island of Matan, is all told with perspicuity and succinctness. We have only to add that perusal is facilitated by a large map of Africa which gives the places both as they were known on their discovery and as they are known now; that, in an older map of 1591, the outlines of three great inland lakes, the Albert, the Victoria Nyanza, and the Tanganyika, can all be traced; that there is a useful index; that a curious old chart of the northern part of Australia indicates that the existence of this southern tract was more than suspected at a date prior to that assigned for its discovery; and that at page 248 there is a very good drawing of a stone statue of Prince Henry in armour, the noble expression of which seems to guarantee the moral qualities ascribed to him by friendly contemporaries, and fully to justify the author's high estimate of his favourite hero.

THE DARK COLLEEN.*

THE Dark Colleen is a novel which possesses the rare and valuable quality of novelty. It is different from other romances, and from other samples of the Irish school of fiction, in its faults no less than in its good points. An Irish novel entirely devoid of humour is certainly a new species, and it must be said that the lack of humour in *The Dark Colleen* is plentiful and conspicuous. On the other hand, the scenery will be strange to most readers, and in many passages the aspects of nature, whether in an "isle undiscoverable in the unheard of West," or in a Norman village, are very cleverly described. Moreover, the book is a study of a very curious and interesting state of society. The manners and customs are those which students read of, as of dead antiquities, in ancient manuals of Celtic law. The life is that of people as unsophisticated and as much their own rulers as the dwellers in the woodland villages in George Sand's *Maitres Sonneurs*. We may have to observe that the pictures of this life are sometimes theatrical, and that the light upon them, though it never was on sea or land, has often illuminated the boards of the British theatre. Admitting all this, and even admitting the much graver fault that, with one or two exceptions, the characters want life and reality, it must still be said that *The Dark Colleen* is a novel which no thorough novel-reader should miss, and which people who generally shun novels may go out of their way to enjoy.

Morna Dunroon, the *Dark Colleen* of the story, was a native of Eagle Island—a fragment, as may be guessed, of an ancient continent that extended westward of Ireland. The people were half Celtic in blood, half Spanish; for one of the vessels that were driven north and west in the great storm that scattered the Armada found rest in the natural haven of Eagle Island. "Free from the emasculating breath of modern culture and modern thought," as the author quaintly says, the natives of Eagle Island were sound Catholics and devoted believers in fairies and water spirits; above all, in the Midian Mara, or Mermaid Queen. The heling people enjoyed autoomy in a sense more extended than that of modern English diplomacy, and every year elected a "king." There was no constitutional reason why the same worthy should not hold the post for several turns in succession, and the father of Morna Dunroon had been king for twenty years when the story opens. Now it must be specially noted that the Eagle Islanders held the Homeric and primitive theory of good government, the theory which prevails in the *Odyssey*, and which is stated in the *Senchus Mor*. When a good king reigns, then, as Mr. Worsley translates Homer, and as the people of Eagle Island believed,

Then the dark earth produces wine and bread,
With fruit the trees bend, and the hills seem white
With flocks, and fishes swarm in the sea's bed,
And the whole people thrives for such a righteous head.

Under a bad king herrings sail and the potato disease brings famine. The plot of *The Dark Colleen* turns on the universal and implicit belief in this theory of government. It was Morna's destiny to spoil her father's long and prosperous reign. It happened to her one morning to be early abroad, in a land which may best be described in the words of the author:—

The Island itself is revealed fresh from the dewy baths of morning.

* *The Dark Colleen*. By the Author of "The Queen of Connaught." 3 vols. London: Richard Bentley & Son. 1876.

Crags, mountains, glistening peaks that point to heaven; stretches of green pasture and growing corn, black moors and wastes of heather; streams and mountain loughs glimmering before the eye. The sides of the mountains are torn into craggy dells, through which the torrents creep; and here and there amidst the openings in the granite crags are glimpses of emerald where the sheep and goats creep small as white mice. Far below the land stretches in an even sweep of grass and heather, broken up by crags and boulders and loose stones. To the south of the island fantastically shapen rocks form promontories projecting far out into the sea: some detached and pointing needle-like to the sky, others topped with table-lands of grass and heather, which are again enclosed by masses of distorted crags, crested with sea smoke and drifting clouds. All round the cliffs are terrible, opening here and there like huge jaws filled with sharp cruel teeth. Beneath these the sea washes and surges incessantly in and out of caverns black as night;—then it is cast back, and the hissing foam spreads out upon the water, and the white sea smoke, rising high in the air, is beaten into the face of a young girl who stands upon one of the highest cliffs, looking out over the ocean.

After enjoying the prospect from the height Morna went down to the coast, and there found, still alive, a French sailor who had been washed on shore from a wreck. It is difficult to believe in the possibility of his recovery in the circumstances described. Emile Bisson was spared by the sea only to do himself. He was the captain of a sailing vessel, and "as beautiful a youth" as any of the paragons who abound in modern studies of the Renaissance. He had golden hair, blue eyes, "a superb smile," "a cooling voice," a soft moustache, soft white fingers, and a habit of saying *Mon Dieu* which becomes very wearisome. He wore gloves when at sea, incredible as it may seem; he scented himself, and, in short, was as unlike a French sailor as he could well be. By way of wakening him from his deadly exhaustion, Morna "swept back the dripping hair, and evenly read every line of the fair face," and, by means of this simple process, curiously omitted in the instructions of the Humane Society, "his eyes opened once more." There was clearly life in Bisson, observing which the rough fishermen who soon came on the scene were naturally anxious to throw him into the deep. "Save a stranger from the sea, and he will prove your bitter enemy" was their motto. They argued that the Midian Mara (who very likely was only an ancestral spirit after all) would be annoyed at the rescue, that mackerel would cease to visit the coast, that the potato disease would return, if Bisson were resuscitated. Dunroon, the king of the island, was, as we have seen, personally interested in avoiding the threatened evils. The crown princess, however, very injudiciously insisted on sending for the local medicine man, a savage quack named Tuam O'Deeagan, and, by aid of the charms of Tuam and the powers of a good constitution, Bisson rallied and recovered health.

It is scarcely necessary to say that Bisson, as he grew stronger, took a fancy to Morna, and that Morna fell in love with him. We are repeatedly told that the rogue of a captain thought her a mere pretty savage, and not what the author chooses to call a "civilized." Time slipped away, and visitors came to the island; among others, Father Moy, a rather drunken but well-meaning priest, and Barron O'Cloasky, a wandering beggar. These two odd people are, with the exception of the pure and passionate heroine, the best characters in the book. Barron was a contented creature, and a good son, who took with him in all his wanderings his old father, mounted on a donkey. The donkey showed great sagacity by kicking Bisson at sight, and was clearly an animal of much foresight and value. Though there was plenty of drink (why not "lashings and lavings galore"? it is strange to miss these familiar terms in an Irish novel), the island was discontented. When the Feast of the King came, and when Dunroon was making for the royal seat, the revolutionary feeling broke out, and the fishers called for a new monarch. There had been no luck since Dunroon saved the Frenchman, they cried. The sceptre was just going to pass from the Dunroon dynasty, when Morna, whose girlish modesty had hitherto kept her silent, offered to dive down to the haunts of the Midian Mara, and pluck a crimson flower from her sea gardens. The superstitious folk were satisfied with this arrangement, and Morna, who had a marked liking for "sensation headers," was as good as her word. The description of her moonlight adventure, though clever and striking, lacks, we think, the magic, the "glamour," with which some writers would have invested such a daring incident of romance.

In spite of the Colleen's courageous dive, and in spite of the blessing of the priest, luck did not turn. Bisson lingered in the island, and the mackerel and herring held off. Truagh, a boat-shaped dwarf and an admirer of Morna, once witnessed a tender scene between the Frenchman and the girl, and that scene was only the beginning of evil. Morna defeated by her native purity and innocence the schemes of her would-be seducer, and Bisson was obliged to get the priest to perform the marriage service in secret. Soon after he left the island, and took Morna with him to Bernice, a little Norman town some seven miles from the port of Hantour. Though Bisson had married Morna, he was by no means disposed to acknowledge her as his wife. He kept her secluded in the inland town, and passed his time flirting with Euphrasie Monier, the *dame de comptoir* of a little café in Hantour. The selfishness and the hard prettiness of Euphrasie are very carefully sketched, and one is made to feel that she really possessed "the charming innocence of a girl of nineteen, mingled with the practised coquetry (*sic*) of the woman of thirty." By skilful manoeuvring this siren at last extracted an offer of marriage from the scoundrel Bisson, who was now obliged to devise some plan of getting rid of Morna. Nothing better occurred to him than to decoy her on board his new vessel, and leave her to the tender mercies of his mate Nicole Louandre, who, believing Morna to be

a castaway mistress of Bisson's, had no reason to fancy that his own delicate attentions would not be acceptable. Morna baffled him by the simple expedient of leaping overboard, and swimming a quarter of a mile to shore. Safely landed, she walked home, and surprised Bisson in the act of making love to Euphrasie. After a cleverly-written scene, in which the scoundrel convinces the unwilling Morna that he is weary of her, she walks back to Hantour, in a sort of dream, and embarks for Ireland.

So far the story, though not very probable, has not only not revolted the reader by its absurdity, but has often charmed him with the pure and ardent affection of Morna, or pleased him with slightly over-coloured but still effective sketches of scenery. When Morna reaches Ireland, a less pleasant passage occurs. The weary and bewildered girl, lost in a large seaport, is beguiled by an old hag into a low drinking-shop or shebeen, where sailors kiss and annoy her. Among others, Louandre meets her, recognizes her, and, when she escapes, pursues her. By great luck she encounters Barron O'Cloasky, his stately old beggarly father, and the donkey, who is now promoted to the dignity of a capital letter, and is spoken of as the Ass. Morna very naturally faints from fatigue, and Barron recognizes her. Then, "in the old Celtic tongue, which Morna knew and loved so well, a voice exclaimed, 'Begorra!'" It added more solemnly, "By Our Lady and all the Saints, if it isn't the Colleen Dubh!" A battle royal between Barron and Louandre was settled by the intervention of the donkey:—

Louandre, standing with clenched fists raised in the air, received the kick full in his side, and with a groan he fell. For a moment all stood amazed, gazing silently upon the man's senseless form; then Morna ran to the Ass, and fell with a low hysterical cry upon her neck.

This was the passage which compelled us to conclude that Irish humour was not among the gifts of the author of *The Dark Colleen*. We do not intend to follow the Ass, Barron, the old man, and Morna back to Eagle Island, nor to forestall the curiosity of the reader by disclosing the end of this eventful history. The conclusion is in harmony with the wilder vein of the narrative, and all through the book we miss and long for a return to the pleasant quiet of the early chapters. Pleasant quiet, the author may say with some truth, never does return; things never are again as they were before some one eventful hour or day robbed life of its illusion, and nature of her soft peace and charm. Still, after a tale more full of storm and turmoil than our analysis even hints at, art demands some "rest and returning," and more promise of fair weather than we can detect in the latest pages of *The Dark Colleen*. Our readers are left free to imagine a more sedate and tranquil, though not a very attractive, love affair in the future of Morna. Many will be glad, no doubt, to weave a day dream of their own in which she is serenely prosperous; for though her history, as told here, wants humour, and the sense of proportion, and graceful ease, she herself is certainly a person in whose destinies no one can help feeling concern and interest. These emotions will make all but hardened critics overlook the occasional blemishes and the prevailing stiffness of the novel.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE SATURDAY REVIEW.

Price 6d.

CONTENTS OF No. 1,117, MARCH 24, 1877:

Germany. Egypt. The Protocol. The Papal Allocation. The Chinese in California. Liberty of the Press in France. The Stock Exchange.

Health and Temper. Dean Stanley in *Exilium*. Newspaper Developments. "Bulgarians and Turks." Suburban Clubs. The Anglo-French Commercial Negotiations. The Last of the Octa Lida Book. The Doctrine of Provocation.

Prothero's Life of Simon de Montfort. The Envoys of London. Doukan's Correspondence. Major Russell's Turkish and Russian Wars. La Légende des Sides. Sellar's Virgil. The City of Sunshine. Prince Henry the Navigator. The Dark Colleen.

CONTENTS OF No. 1,116, MARCH 17, 1877:

THE NEGOTIATIONS.

AT the present moment there is an apparent improvement in the prospects of peace. According to one statement, the English Ministry has intimated that it will sign the Protocol on condition that Russia shall make a formal engagement to demobilize, and that, in the event of any failure in fulfilling that engagement, the Protocol shall become null and void. It is also said that the Russian Government is willing to accept this compromise, and to put the promise to demobilize into a memorandum, which may, if necessary, be read to the English Parliament; but in return it requires that the promised removal of the troops shall be deferred until the Porte has accepted the Protocol and made peace with Montenegro. Assuming that this is the present state of the negotiations, it is no doubt, in a certain degree, a step in advance; but it does not appear that there is yet sufficient ground for believing that all difficulties are over. It is evident that the postponement of the demobilization until differences are at an end between the Porte and Montenegro opens up an ominous possibility of delay, and it is easy to conceive that influences might be applied to effect this result. A stipulation that the disarmament should depend on the decision of a Russian Minister or General could scarcely be more illusory. The Prince of MONTENEGRO will make peace when he receives orders to that effect from St. Petersburg, and he will not make peace before. Again, much must depend on the manner in which the demobilization is to be carried out, and this involves a number of delicate and awkward questions, such as the distance to which the Russian forces are to be removed from the Turkish frontier, and whether they are to be allowed to leave behind them, to be ready for a possible return, the vast amount of warlike stores which they have been accumulating there for some time past. Nothing is now said of the reported proposal that Turkey should be the first to disarm; but, if it was really made, it was obviously vexatious. The Turks are not about to invade Russia, and they cannot be expected to place themselves at the mercy of a superior enemy. Nevertheless it is a question whether it is worth while to exact a promise of disarmament as a condition of agreement. If a Protocol setting out the terms on which peace is to be maintained is to be signed by the Great Powers, it will perhaps be in the power of Russia to render the transaction nugatory by invading Turkey in the spring; but the diplomatic and moral position of the aggressor would then be injuriously affected by the previous verbal arrangement. An implied undertaking to disarm could not be violated except at the risk of provoking universal indignation. Any supposed sanction of a Russian right of interference in Turkey would be worthless if obtained by means of deception.

The diplomatic uncertainties and difficulties which have now occupied several months have perhaps reflected the vacillations of Russian policy. The Emperor ALEXANDER, who must at the time of the Moscow speech have resolved on war as the only alternative to the submission of Turkey, appears to have afterwards hesitated on the verge of a costly and uncertain enterprise. The latest reports of military movements indicate the probable resumption of a warlike policy; and the violent and menacing language of the Russian papers corresponds with the measures of the Government. The advantages of a free press are universally recognized; and, on the other hand, it may in certain

states of society be impolitic to allow unrestrained discussion. The combination of reckless license with total absence of liberty has only been found possible in Russia. The mischievous sophisms, the insolent denunciation of foreign States, the reckless provocations to war which are periodically substituted for ordinary discussion, represent the appeal of despotism to popular passion. The Government which lately banished the professional advocates of a batch of political prisoners allows no serious treatment by journalists of domestic questions, and prevents at its pleasure the expression of opinions on foreign affairs which may be distasteful to itself. When it is thought expedient to support diplomacy by intimidation, the newspapers are stimulated and let loose; and Europe is invited to acknowledge the necessity of deference to a spontaneous expression of the national will. At present the literary agents of the Government are chiefly engaged in attributing to England the risk of a rupture which, if it occurs, will have been deliberately prepared and directly caused by Russia. It may be true that, in conventional phrase, the English Government might have been more ready to build a golden bridge for the retreat of Russia from a false position; but the construction of any bridge is likely to be languidly pursued when it is known or suspected that the fabric is not destined to be used. The English Government may perhaps have ascertained that the tedious exchange of protocol drafts was only designed to occupy the time till the roads in Roumania and Bulgaria should become passable in spring.

The debate of Friday week gave Mr. GLADSTONE the opportunity of making another eloquent speech, and enabled the Government to put their adversaries in an absurd position. If Mr. FAWCETT's motion was, as Mr. GLADSTONE said, merely a peg to hang speeches on, its form and substance may have mattered little; but Mr. FAWCETT himself took a more serious view of his own language and conduct; and it is surprising that he should not have understood the feebleness of the argument which he intended to imply in his Resolution and to support by his speech. He cannot have quoted Lord DERBY's phrases except for the purpose of insinuating that the Government was about to repudiate principles affirmed by the FOREIGN MINISTER; yet it was impossible that Mr. FAWCETT should know the purpose and tenor of the late negotiations. Lord HARRINGTON and Mr. GLADSTONE himself declined to vote for the motion, and Mr. FAWCETT, by offering to withdraw it, acknowledged the inopportune nature of his censure on the Government. As an apology for blunders and confusion, it is suggested that, while all the world is talking about the Eastern question, it is unreasonable to ask that Parliament should be exceptionally silent. The distinction between irresponsible conversation and declamations which may compromise the national policy might have seemed too obvious to be mentioned. It is utterly wrong to propose motions for the purpose of hanging speeches upon them. Mr. GLADSTONE's speech probably gained in effect by the accident of his having mislaid his papers. Detailed statements of outrages committed on Turkey would have been less interesting than the powerful declamation which took their place. The admiration of the Liberal members for the oratory of their former leader must have been tempered by annoyance at being compelled to vote either with the Government or against their own convictions. It was remarkable that, notwithstanding his impressive denunciation of the Turks, Mr. GLADSTONE abstained, as he has abstained on all former

occasions, from propounding a policy. Mr. FAWCETT's motion pointed directly to coercion; and perhaps Mr. GLADSTONE may share his opinion; but he has never yet expressed it. It is still more probable that he would incline to acquiescence in Russian intervention; but on that point also he has been silent. In his letter to Sir H. DRUMMOND WOLFE, and in his speech on Tuesday last, Mr. GLADSTONE admits that during the Cretan insurrection he thought humanity must yield to the higher duty of preserving neutrality. He intimates an opposite judgment as applicable to the present contest; but whether he proposes a breach of neutrality, or an approval of a breach of neutrality by others, he has never yet distinctly stated. Lord DUFFERIN avowedly holds peace to be more important than the reform of Turkish administration. Mr. GLADSTONE has not yet pledged himself to the logical consequence of his numerous speeches and pamphlets.

The only forecast of the future which can be confidently made is the oracular proposition that the intentions of Russia will be fulfilled, whether they point to peace or to war. The English demand of disarmament as a condition precedent to the signature of a Protocol is an attempt to anticipate by a few days or weeks the ultimate solution. As Sir S. NORMAN said in answer to Lord HAVINGHAM, and in due official phrase, the present meeting relates rather to the circumstances in which the Protocol is to be adopted than to the terms in which it is expressed. Either the Government is still ignorant of the purposes of Russia, or it is not at liberty to communicate the knowledge which it may possess. It would have been well if Parliament had during the interval of uncertainty been content to abstain from desultory debates on isolated portions of the Eastern question. One of the most unreasonable paradoxes which could have been concocted at the present moment is Mr. GLADSTONE's false belief that before the Crimean war Russia possessed an undisputed right of intervention in the domestic government of Turkey. On the contrary, the ostensible cause of the war was the demand by the Emperor NICOLAS of a concession which, if Mr. GLADSTONE's opinion were correct, would have been utterly superfluous. It is hard on Sir H. ELLIOT that his withdrawal from the Embassy at Constantinople should be recommended on the ground that he secured the conviction which was entertained in 1853 by the Government of which Mr. GLADSTONE was a member, and by the Emperor NICOLAS himself. It will perhaps not be expedient that Sir H. ELLIOT should return to Constantinople, because he represents a policy which has been partially abandoned, and also because the Opposition has probably succeeded in convincing the Turks that the Allies were disposed to connive at their follies and crimes; but it is well that Mr. BOWEN should have denounced in appropriate language the vile and calumnious attacks to which Sir H. ELLIOT has been exposed. The personal enmity of more than one newspaper correspondent to the Ambassador added venom to false charges and insinuations which probably originated in Russian suggestions. Sir HENRY ELLIOT was accused in plain terms of intrigue against Lord SALISBURY, by writers who had previously favoured or propagated the mendacious report that he advised the Porte to reject proposals which had been sanctioned by the English Government. It may have been some consolation to an upright public servant that in the late debate every speaker, except Mr. BYLANDS, recognized in becoming language the honourable and loyal character which had been so wantonly impugned. It is to be hoped rather than expected that Sir H. ELLIOT's assailants and detractors will deal fairly with his temporary or permanent successor.

ITALY.

THE outline of this year's Budget has been submitted to the Italian Parliament by Signor DEPRETIS, and the prospect which Italy has before her is at least as satisfactory as could have been expected. If Italy is not exactly solvent, she is marching to the great goal of solvency with firm and vigorous steps. There is to be, if all goes well, a surplus this year. It is not a large surplus, being somewhat under half a million sterling; but still a surplus of any kind is a glory to Italy. Italy is very hard pressed by taxation; but she becomes every year more prosperous and rich. Her income for the present year is estimated at 55,880,000*l.*, and her outlay at 55,400,000*l.*; and

the exertions which Italy must make to raise a sum so large in proportion to her resources are very great. It is an old story, too, that some of the taxes are very hard to bear, especially the Grist-tax, and the present Ministry came in pledged to mitigate, if not to remove, the grievances to which the exaction of the Grist-tax gives rise. But in practice the Ministry has been obliged to let things go on as they were, as this was the only means of keeping up the credit of the country. Signor DEPRETIS cannot admit any remission of taxation, and his hope for the future lies in the prospect that the existing taxes may be gradually made to yield more and more by the development of the national resources and by an adroit arrangement of new treaties of commerce. He, however, takes credit to his Ministry for having already done something which entitles it to special commendation. His predecessors, he says, were wrong in their estimates. The income of last year was over-estimated by nine millions of francs, and the expenditure underestimated by eighteen millions. But he and his colleagues effected reductions to the amount of twenty-four millions, so that they succeeded in almost exactly repairing the blunders of the MEXIMATI Ministry. Even, however, if all goes this year as well as could be wished, and there really is a small surplus, the financial position of Italy will still be far from what patriotic statesmen would wish to see it. In the first place, there is a large floating debt of over nine millions sterling, and it is not obvious how Signor DEPRETIS, so far as his speech has hitherto been reported, proposes to deal with this great source of difficulty. In the next place, Italy is cursed with a large inconvertible paper currency, the inconveniences of which are felt in every transaction of daily life. Signor DEPRETIS has had the courage to try to do something not inconsiderable in the way of grappling with this gigantic evil. He proposes that the present limit, which is about thirty-seven and a half million sterling, shall not be exceeded, and that a sinking fund shall be instituted, beginning with 300,000*l.* next year for the extinction of the paper currency. Lastly, he thinks it indispensable that the Credit Institution shall be reformed and provided with new capital. For this purpose he proposes—if this is the real meaning of his proposal, which has as yet been only briefly reported by telegraph—that the land belonging to the rural communes shall be sold, the communes receiving an equivalent charge on the State, and that the money produced by the sale shall be used to set up land banks. This is a bold measure, and one open to many obvious objections; but it is premature to criticize it until its exact character and drift are more precisely known than they are at present.

The quarrel between the Vatican and the Quirinal rages with unabated fury. Cardinal SIMEONE has now issued a reply to Signor MAXIMATI's circular to the magistrates in which the reasons were stated which had induced the Government to permit the publication in Italy of the Pope's recent Allocation. The new Papal utterance is written in a strain of passionate indignation, and openly appeals to foreign Powers to intervene on behalf of the Pope. At the bottom of the dispute lies an irreconcilable divergence of conception as to what the Pope's position in Italy really is. The theory of the Italian Government is that, when the temporal power was taken from the Pope, Italy undertook to furnish him with an asylum exempt altogether from Italian jurisdiction, where he might go on, so far as Italy was concerned, exactly as if he were at Avignon or Malta. He is as safe from personal violence or interruption in the functions of his spiritual office as if he were living under the protection of France or England, and in addition the Italian Government would pay him a handsome pension if he chose to accept it. But then Italy claims that the Pope's position shall carry with it all its consequences. The fact that it is Italy which gives the Pope an asylum which he must have somewhere does not alter the relations which Italy has, in common with other Catholic countries, to the head of the Church. Italy is, in the eyes of the Italian Government, as free to deal with the temporal difficulties arising out of the Pope's acts as if the Pope were a thousand miles away from the Vatican. France claims the right of prohibiting the publication of documents issued by the Pope, and it is only a question of discretion when the French Government will exercise this right. Signor MAXIMATI in the same way considered the Allocation issued from the Vatican exactly as if it had been issued from Avignon. He was quite at liberty to stop its publication if he pleased, but he thought it better not to stop it, and most people

will think he judged wisely. If, again, Italian subjects or foreigners residing in Italy choose to make the Papal Allocation a handle for attacks of their own on the Government, Italy considers itself as free to punish them, so far as the law permits, as it would consider itself free to punish persons advocating a Republican revolution or the restoration of the King of NAPLES. If it pleases, the Italian Parliament may increase the rigour of the laws against ecclesiastical agitators, just as any other country may legislate directly against priests if it thinks fit. Lately the Italian Government has taken a step in this direction, and the step it has taken appears to be a decidedly wrong one. It is monstrous that priests should be liable to legal penalties because they disturb the peace of families. They cannot do their duty unless they sometimes disturb the peace of families, nor can any men who try to make the world better. The Italian Government disturbed the peace of a good many families when it took advantage of Sedan to drive the Pope across the Tiber. But there seems nothing more monstrous in such an enactment if made in Italy than if made in France or Austria, when once the main theory of the Italian Government is adopted, and it is recognized that, whether the Pope happens to be in the Vatican or at Avignon or at Jerusalem, the sphere of secular government in Italy remains always the same.

It is needless to say that a totally different theory of the Pope's position as regards Italy prevails at the Vatican. There it is held that Italy, when seizing by an act of execrable violence on the temporal possessions of the Pope, bought off the hostility of other Catholic Powers by entering into a covenant with the Pope, with the Catholic world generally, and especially with France and Austria, that Italy would for all future time stand towards the Pope in a perfectly exceptional position. The spiritual power was to be able to do throughout all Italy exactly what it pleased. For spiritual purposes all Italy was to be taken to be situated within the precincts of the Vatican. The Pope's Bulls and Allocations were to circulate from the Alps to Sicily as a matter of right. If priests attacked the Government, it was to be a sufficient answer that they were priests and were doing what they were told to do. If these privileges were in any way infringed, then France and Austria and any other Catholic country would be entitled, and, so far as proper Catholic motives guided them, might be relied on, to intervene and make Italy keep to its bargain. This is the Papal view, and it is so diametrically opposed to the Italian view that arguments founded on the two theories cannot possibly touch each other. Cardinal SIMONE, for example, begins by pointing out that it is no concession to the Pope that the publication of his Allocation has been permitted in Italy, because any day a Minister may take a different course, and the successor of Signor MARINI may prevent the publication of a future Allocation. If the publication of Allocations is a matter of right, this is as good an argument as could be wished. If it is a matter of discretion, the argument has no force whatever. Cardinal SIMONE goes on to complain that, whereas Ministerial papers are allowed to criticize the Allocation, clerical papers are not allowed to defend it. Here, again, the ground of complaint is strong or weak according as the one theory or the other is adopted. If the Italian Government is at liberty to treat the Papal Allocation as it would treat a Republican manifesto, it is natural that it should leave in peace the papers that blame, and should weigh heavily on papers that support, an attempt to destroy it. If, on the contrary, the Italian Government has consented to allow everything to be said and done against its interests and existence of which the Pope approves, there can be no doubt that it breaks its covenant every day. So, again, as to foreign intervention, the CARDINAL is quite right in invoking it if Italy bargained with foreign Powers that she would let the Pope do what he pleased on Italian soil; but, if foreign intervention is only to be the instrument by which Italy is to be forced into such a bargain, Italy may very naturally wish foreign Powers to mind their own business, and not create for her a position which they would not accept for themselves. All this, however, refers only to the question of principle involved in the controversy. Apart from principle, Italy has to exercise a discretion, and in real life there are many reasons why Italy will do well to treat the Pope and the clergy with as much gentleness and leniency as possible; and it is much to be regretted that in her new measure she

seems to have departed from the attitude of patient and indulgent wisdom which has hitherto characterized her dealings with the Papacy.

THE SESSION TO EASTER.

THE first quarter of the Session has not corresponded in all respects with the anticipations which had been formed. The autumn agitation seemed to forebode a conflict of parties in which the Parliamentary minority would be supported by popular sentiment. Both Houses have since occupied themselves at least sufficiently with the Eastern question; but the Opposition has prudently declined to expose its weakness by a division. Desultory censures of the past policy of the Government were easier and safer than a trial of strength on any definite or tangible issue. It would have mattered little to the leaders of the Opposition if they had been merely outvoted, provided they had any preferable course of action to recommend; but the real question was whether coercion should be applied to the Turks; and only a small fraction of the Liberal party would have been prepared to resort to force. Mr. GLADSTONE himself, though he repeatedly taunted the Government with its alleged desertion of the cause of the oppressed Christians, has never distinctly proposed an offensive alliance with Russia against Turkey. The Duke of ARGYLL, in the most eloquent speech which has been delivered in either House, contented himself with a vague assertion that the Government might, if it thought fit, choose among half a dozen different methods of coercion. Lord SALISBURY, who is perhaps not more friendly to the Turks, answered to the effect that the Porte would probably not yield to the most formidable threats, and that the consequences of actual hostility would be dangerous and incalculable. The tedious progress of the recent negotiations supplied an additional reason for not pledging Parliament to any positive opinion. The discussions which have occurred on various occasions probably reflect the indecision which prevails throughout the country. Indignation against Turkish misgovernment coexists with a general disinclination to undertake the responsibility of correcting the disorders of a remote community. The Government has perhaps lost popularity through its supposed want of sympathy for the sufferers; but it has become evident that the Opposition, if it were restored to power, would be equally helpless. When the Protocol is settled or abandoned, there will perhaps be a new series of debates, with not less unsatisfactory results.

The progress of ordinary business has not been remarkably interesting. Mr. SELWY's Valuation Bill may probably be useful, but it is difficult to feel enthusiasm for or against Assessment Committees. The discussion of the Army and Navy Estimates is always confined to official and professional or quasi-professional speakers. Only a few members feel themselves competent to derive instruction from Mr. KELL's elaborate demonstrations of the mismanagement of the navy; but even civilians arrived at the unanimous conclusion that Mr. SELWY would not put an end to actual or possible abuses by the process of converting a First Lord of the Admiralty into a Secretary of State. Mr. HARBY's statement on moving the Army Estimates was received with general satisfaction. The expenditure for the year shows a slight reduction, and the number of recruits is largely increased. The effect of the great changes introduced by Lord CARDWELL seems thus far to have been highly advantageous; and Colonel MURK, in retracting some former expressions of disapproval, probably represented the feelings of many competent judges of military affairs. It is perhaps to be regretted that Mr. HARBY has determined, for the sake of symmetry, to close the only side door by which candidates for commissions who have not the gift of learning at present sometimes enter the army. Militia subalterns will henceforth be compelled to submit to the universal necessity of competitive examination. Diplomats and Foreign Office clerks will probably not long escape the iron rule of competition; but Mr. TRAVELMAN failed for the time in his attempt to convince the House of Commons that appointment to office by number of marks is a law of nature. He protested in vain that some of the Indian civilians who have entered the service under the modern system promised in course of time to rival their predecessors who were appointed by the favour of Directors. Popular zeal for competition has perhaps diminished since it has been discovered that the necessary preparation under cram tutors

is so costly as to exclude the poorer classes from competition. The supporters of the modern system were the less disposed to interfere with the discretion of the Government because the present FOREIGN MINISTER and the present CHANCELLOR of the EXCHEQUER have always been advocates of competition. Lord DERRY, though he might at his choice directly appoint Foreign Office clerks, selects by competitive examination among ten or twelve nominees. The diplomatic service alone is still recruited by merit or by interest.

Only a few annual motions or schemes of private members have been disposed of during February and March. Sir JOHN LEBROCK carried against the Government the second reading of the Bill for preserving Ancient Monuments; and possibly the measure may hereafter emerge from the Select Committee to which it has been referred. Mr. KNATCHBULL-HUGHESSEN also obtained a majority for his strange proposal that English landed property owned by a colonist should devolve according to the law, not of England, but of the colony. The deceased wife's sister party will have to content themselves with their unexpected triumph, for the objections to the measure are not confined to the social question. It is impossible to establish for the colonies a different principle from that which determines the rights of the issue of Scotch marriages. The debate on the Bill for enabling municipal corporations to purchase a monopoly of the trade in liquor was chiefly remarkable for the establishment or commencement of Mr. CHAMBERLAIN'S Parliamentary reputation. His local influence and his ability in municipal administration were generally recognized, and he was not unknown as a political writer; but it can never be certainly known, except by experiment, whether a new aspirant will suit the taste of the House of Commons. Mr. CHAMBERLAIN'S force of argument, his moderation, his language, and his manner secured the approval both of fastidious critics and of the House in general. It is not improbable that, when the moderate section of his party has been eliminated by future elections, Mr. CHAMBERLAIN, who is understood to hold opinions which are now thought extreme, may be a principal leader of the Liberals, and in his turn a Minister. His political career is more hopeful than his project for suppressing the trade of publicans and licensed victuallers. Sir WILFRID LAWSON, who has not yet moved his Permissive Bill, gave a partially ironical support to the Gothenburg device. He would probably have voted with the majority if Mr. CHAMBERLAIN had not given corporations a discretionary power to withhold the enjoyment of alcoholic drinks from their unfortunate subjects and constituents. The division on a Bill which was indirectly permissive will be repeated when Sir WILFRID LAWSON'S debate recurs in due season. The Government has redeemed its pledge of allowing the Irish Sunday Closing Bill to pass the second reading. A Select Committee has since collected evidence which tends to show that hasty deference to Irish clamour is not unlikely to produce serious discontent in Ireland.

The first appearance of new Ministerial leaders in both Houses was watched with natural curiosity. Lord BEACONSFIELD, after one or two skirmishes on the Eastern question, has had no opportunity of exhibiting the faculty which he probably possesses of adapting himself to change of position. The House of Lords, which has generally but insufficient employment at the beginning of a Session, has this year been compulsorily idle. In almost the only division which has taken place the majority consisted of three peers, and the minority of one. It is unlucky that the great abilities of Lord SALISBURY, Lord CARNARON, Lord CAIRNS, and Lord BEACONSFIELD himself should find little or no Parliamentary occupation, while their colleagues in the House of Commons are far overmatched in debate. Sir STAFFORD NORTHCOTE, though it is premature to judge of his ultimate success, has scarcely satisfied the moderate expectations which were formed when he was designated as successor to Mr. DISRAELI. With the aid of Mr. HARDY, he has sustained without conspicuous failure the unequal contest with the leaders of the Opposition; but his management of business has on more than one occasion been deficient in foresight and in firmness. The leader of the House is responsible for the blunder of announcing by Circular an impending division on Mr. READ'S motion for County Boards, when he ought to have understood that the county members, though they disliked the innovation, could not safely oppose it. The excuse for subsequent acquiescence, founded on the moderation of Mr. READ'S speech, was trans-

parently insufficient. Representative government in counties may or may not be desirable, but its expediency can by no possibility depend on the language which may be used by one of its advocates. The grant of a Committee on the Stock Exchange, after Mr. STANHOPE had been allowed to deliver an able speech against the motion, was another instance of weakness. A Minister ought to make up his mind at least the day before a debate, and not when it is proceeding. There is still time to redeem oversights, and to correct erroneous tendencies. The position of the Government has not been seriously affected; and the temper of the constituencies two or three years hence cannot be ascertained beforehand. According to present appearances, the Ministry will last as long as the Parliament.

THE INDIAN BUDGET.

THE Indian Budget—the Budget, that is to say, introduced in the Legislative Council—is necessarily of more than ordinary interest. So long as India was supposed to be steadily, if slowly, approaching the time when her receipts and expenditure would show a proper equilibrium, the subject had not much attraction for Englishmen. The details of Indian taxation were necessarily strange to them, and it was only on rare occasions that they could have an opinion upon the relative merits of this or that impost. The famine in the Deccan has worked a remarkable change in this respect. It has made it clear for the first time that famines are a regular element of Indian life, and that in one province or another a famine, or rather a scarcity needing special provisions to ensure that it shall not grow into a famine, may be looked for every two or three years. It is plain that, if this is the case, the calculations of Indian expenditure must be completely recast. Hitherto a famine, with the loan that is necessarily incurred for its relief, has been regarded as a piece of abnormal ill-fortune. It deranged the Budget of the year; but when once it was over, and the additional interest had been duly added to the liabilities which the Indian Finance Minister had to meet, it passed from recollection. The idea that famines return with sufficient regularity to make it a part of the Finance Minister's ordinary duty to provide against them is fatal to all the comfortable theories of Indian economy that have of late been popular. It now appears that the expenditure of the Government of India, taking not one year with another, but one period of three years with another, is invariably and largely in excess of its income. When once this fact has been realized, the Indian Budget passes into the region of high political problems. Whether the revenue can be increased by new taxes or the expenditure lessened by new economies, or whether the missing balance is to be looked for in the direction of an increased outlay on public works which may have the effect of preventing famines by enabling the Indian cultivator to deal with drought, are all questions of pressing importance to England as well as to India.

The debate in the Legislative Council of which a summary was given in Monday's *Times* scarcely rose to the height of the occasion. The decentralization projects which are included in the Budget seem to be generally approved, perhaps from the natural preponderance in the Council of the representatives of Bengal interests. One of the native members argued that it was unjust to levy fresh taxes on Bengal, inasmuch as the province already yielded a large surplus revenue. It will be hardly convenient if the Government of India should hereafter find that the wants of a poor Presidency cannot be supplied from the abundance of a wealthy one without causing discontent among the population which has to contribute to its neighbours' needs. Decentralization is an excellent expedient for securing local supervision of local expenditure; but it cannot be successful unless a very clear line of demarcation is drawn between the local and the national exchequers. Bengal must go on paying a share of the income of India which will be calculated according to the wealth of the province, not according to the proportion of that income which is actually needed for local purposes. Lord LYTTON described the effect of the Decentralization Bills with commendable moderation when he said that they were merely intended to give the earliest possible application to the principle that the local Governments should be financially responsible for the mainten-

ance and management of works of special local utility. Even with this restriction the process ought to be carried out with very great caution.

The subject which excited most interest in the Legislative Council was the repeal of the Customs duties; and Sir JOHN STRACHEY had to explain early in the debate that too much importance had been attached to this part of his speech on introducing the Budget. He had only meant, he said, to speak of a good time coming; of a time in which the necessary revenue would be raised without the imposition of a single Customs duty, and the untaxed wares of the world would have free access to all parts of India. But in saying this he was only expressing his opinion that it ought to be so, and his desire that it might be so. He had no intention of doing anything at present to bring it about. The Customs duties yield on an average two millions and a half annually, and a Finance Minister who has to raise a loan in India, and to get another raised in England to meet the expenses of the year, is not likely to throw away a sum of that magnitude. Even the 300,000*l.* which is furnished by the cotton duties is not to be replaced by fresh taxes. The Government hope that the day will soon come when the first step towards their abolition may be taken; but even this partial approach is not to be attempted during the present year. Sir JOHN STRACHEY's qualification of his earlier statement is exceedingly prudent, and it may perhaps seem ungracious to remark that, if the earlier statement had not been made, there would have been no need for the subsequent qualification. But Lord LYTTON, who spoke on Wednesday, did not imitate his Finance Minister's prudence. Whether the fault be the Viceroy's or some one else's, there is an unfortunate disposition in the Government of India just now to amuse itself with statements of general principles which it either does not intend, or knows that it will not be able, to put into immediate action. We had occasion the other day to notice an example of this tendency in the preamble to the instructions on the mode of dealing with the famine, and Lord LYTTON seems to have again fallen into the same error with regard to the cotton duties. The majority of the speakers in the first Budget debate were apparently much more in sympathy with Sir JOHN STRACHEY in what may be called his second Customs phase than with the Viceroy. One member feared that the abolition of the duties might stifle at its birth a now and promising Indian industry. Another thought Sir JOHN STRACHEY's picture Utopian. Another could not agree that the interests of India and Manchester were identical in the matter, and urged that Indian interests must be first considered. Another believed that there was no form of taxation so sound, so productive, and so little open to objection as the Customs duties, and that perhaps the least objectionable of all of them was the tax on the finer kinds of cotton goods.

It does not matter whether these arguments are sound or unsound in themselves. The point to be noticed is that there was not the least need that the discussion should ever have been raised. Englishmen would be glad of a financial millennium in which the untaxed wares of the world would be laid at their feet; but Chancellors of the Exchequer do not think it necessary, when they have no surplus, to picture the charms of getting tea, wine, and tobacco free of duty. They reserve their outbursts of enthusiasm for those happy years in which they have money available for the remission of taxes. It must be said, by way of excuse for Sir JOHN STRACHEY, that there seems no probability that any such year will come round during his term of office; and he may consequently think it hard to be entirely deprived of the pleasures which fall to the lot of more fortunate Finance Ministers. But the same plea cannot be urged on behalf of Lord LYTTON. The Viceroy had seen the bad effect of Sir JOHN STRACHEY's first speech in the comments made on it in the subsequent debate. He had heard the Lieutenant-Governor of BENGAL insist on the immense mischief that would be done by an announcement that, while the Government of India was pressing the local Governments to tax the pettiest traders in the North-West Provinces, and to throw increased burdens on the peasantry of Bengal, it had formed a deliberate conception of financial policy which would remit the one form of taxation that presses upon European residents in India, in order to comply with the demands of Manchester millowners. We do not say for a moment that this is a fair description of the financial policy which points to a repeal of the cotton

duties. In the long run the people of India must be benefited by the largest extension of Free-trade that is compatible with raising the necessary revenue. But we fear that it is not an unfair description of the considerations which led to the exposition of this financial policy at a moment when there was no possibility of its being reduced to action. Sir JOHN STRACHEY's Budget is calculated for the meridian of India; in presence of so serious a deficit it would have been impossible to do anything else. But Lord LYTTON's speech is calculated for the meridian of Manchester, and, under present circumstances, this argues an unfortunate subordination of the necessities of Indian administration to the necessities of English politics.

SPAIN.

THE result of King ALFONSO's recent journey seems to be regarded as on the whole satisfactory. In judicious conformity with royal traditions he has attended service at churches and cathedrals, he has distributed alms, and he has professed interest in local institutions. Above all, he has shown himself to large numbers of people, and he may probably have earned his reward in the popularity which naturally attends on youth and prosperity. The inhabitants of some of the large towns, and especially of Barcelona, while they displayed a coldness which implies the prevalence of Republican opinions, abstained from acts of molestation or rudeness. The upper and middle classes are probably unanimous in their satisfaction with the re-establishment of a dynasty which promises a certain amount of stability. Every other form of government which has been established in Spain since the fall of Queen ISABELLA has been disliked and opposed by large sections of the population. The restored monarchy has obtained a larger share of acquiescence, if not of support; and it is satisfactory to know that the First Minister is the same who undertook the conduct of affairs when the young KING returned to Spain more than two years ago. Constitutional government is not perhaps yet fully acclimatized in a country where large parties are alternately excluded from all share in the representation. The leader of the small Parliamentary Opposition was not long since regarded as a reactionary Minister; and the Liberals who formerly followed ZORRILLA have no seats in the Cortes. The Republicans, who three or four years ago possessed an enormous majority, are only represented by their former leader, who has been cured by experience of many illusions. Nevertheless the maintenance of constitutional forms will facilitate the resumption or establishment at some future time of a real Parliamentary Government; and meanwhile the Ministerial dictatorship is administered with prudence and moderation. The prospects of Spain have been brighter since the accession of the present KING than for many years before.

The Carlist war ended a year ago, and there is no apparent danger that it will be renewed. The insurrection derived all its hopes of success from the reduction and demoralization of the army under Republican influence; and the mistake is not likely to be repeated. In this and in other instances Spain has within a few years ascertained by practical experience the absurdity of many projects which formerly possessed a certain amount of popularity. The Federal Republic has probably been finally renounced by rational politicians since the revolt of Carthage. The utility of changes of dynasty has been fully proved by the restoration of the reigning family. Notwithstanding both the free choice of a Cortes elected for the special purpose, and his own personal merits, the Italian Prince who was placed on the throne by PRIM never overcame the popular prejudice against a foreigner. It is not known whether the clergy and the Ultramontane faction have been capable like other parties of learning by experience. The KING has been courteously received by the ecclesiastical authorities; and the portion of the clergy which preferred Don CARLOS may perhaps have convinced themselves that they can no longer rest their hopes on a Pretender. It would be too much to expect that Parliamentary leaders should be convinced of the wisdom and necessity of compromise. If ZORRILLA and SAGASTA were once more competitors for the direction of public affairs, jealousy and ambition would probably prevail as of old over dispassionate patriotism. As long as peace and order are maintained, the country will almost certainly become richer and more prosperous. After the

civil war of forty years ago, the wealth of Spain increased during a generation more rapidly than that of France or England. At some distant period the introduction of a more rational commercial policy will give a new impulse to agriculture, trade, and industry. In a well-known passage DEMOSTHENES consoles the Athenians for their misfortunes by reminding them of their folly and weakness. If, he suggests, the triumphs of PHILIP had been obtained in spite of wise and valiant resistance, there would be little hope for the future. It is because the causes of misfortune may be removed by the adoption of a sounder policy that the condition of affairs is not absolutely hopeless. A country like Spain, which has been governed in defiance of economical and political principle, has a large reserve of wealth and power which may be realized at pleasure.

Little or nothing has lately been heard of the insurrection in Cuba. Some months have passed since MARTINEZ CAMPOS accepted the office of Governor-General, in the expectation, which had so often deceived his predecessors, that he would immediately succeed in terminating the civil war. It is possible that his preparations may not yet be completed, and that he has formed some definite and hopeful scheme of operations; but it is extremely difficult to deal with a sporadic rebellion, and to defeat adversaries who neither hold permanent positions nor offer or accept battle in the open field. The causes and the nature of the insurrection are, notwithstanding its long duration, still imperfectly understood in foreign countries. The obstinate resistance offered to the Government seems to imply the existence of widespread disaffection, which is perhaps directed rather against the dominant class in the colony than against the Spanish Government. Former Governors have been greatly embarrassed by the independent or mutinous spirit of the Volunteers who have been organized by the Spanish settlers; but MARTINEZ CAMPOS possesses a resolute character, and he has been accompanied or followed by a large force of regular troops not unaccustomed to war. His reputed ambition affords a security against the temptation to which many Governors have yielded of accumulating a fortune at the expense of the colonists. He may still expect a brilliant career in Spain, where he has strong claims on the Government both as a restorer of the monarchy and as the most conspicuous among the general officers who terminated the Carlist war. It was generally believed when he was sent to Cuba that the Government was not unwilling to remove to a distance a formidable aspirant to political power. If he ultimately restores the authority of the mother-country in the disturbed districts of Cuba, he will return to Spain in the enjoyment of a reputation with which none of his rivals can compete. For the present, he has not performed the promises which were made on his behalf by his adherents.

The greatest danger which menaced Spain in consequence of the insurrection in Cuba has disappeared or has been suspended. The United States no longer threaten intervention on the pretext either of hatred of slavery or of enthusiasm for Republican institutions. President GRANT, though he had the good sense to withhold from the insurgents any recognition of belligerent rights, was in the habit from time to time of urging the Spanish Government to recognize the independence of the island. More judicious American politicians deprecated both the probable anarchy which would result from independence and the responsibilities which would be involved in annexation to the United States. The policy of the American Government is generally more cautious than the language of its members; but it seemed possible that, in the event of any collision, an intervention in Cuba might at any time be undertaken. Before the end of his term of office General GRANT had renewed friendly relations with Spain, and there is no reason to suppose that his successor will share his intermittent zeal for territorial aggrandizement. The Spanish Government has the good fortune to be exempt from actual or probable conflicts of interest with any other Power. The irritation which was at one time felt against the French Government had abated, as its causes were removed even before the end of the Carlist war. With the rest of Europe Spain has few relations and no cause of hostility. It is not yet known whether the King, who has scarcely emerged from boyhood, possesses a capacity which may enable him to serve his country efficiently. Since the earlier years of CHARLES III., who himself ultimately became a pompous trifler, no King of Spain has acquired or deserved the confidence and gratitude

of his subjects. The education of ALFONSO XII. may perhaps have been prematurely interrupted; but it was well that he should become a resident Spaniard while he was still young enough to acquire the feelings and habits of his countrymen. Any intelligence which he may possess ought to have been developed by occasions of witnessing the spectacle both of war and peace. The good will which has been shown to him during his recent progress will be exchanged for a warmer feeling if he profits by the opportunities of his station. A King of Spain might exercise large authority if he showed himself able and willing to take a part in the management of public affairs, and to stand aloof from faction.

THE DUKE AND THE WAR OFFICE.

THE difficulty of devising and carrying into execution any consistent scheme for the organization of the various bodies which together constitute the military force of Great Britain was never shown more clearly than in the Report of Mr. STANLEY'S Committee. Assembled about this time last year by Mr. HARDY, they were dubbed the "Militia Committee," and were generally directed to inquire into "certain questions connected with that arm of the 'service.'" But it is impossible to touch the militia without coming into contact with "certain questions" which bear equally upon the organization of the line; and the instructions issued for the guidance of the Committee directed them to consider "whether the militia regiments 'should not be third and fourth (militia) battalions of the 'local regiment or brigade.'" The answer to this question comes from the Committee with great distinctness and apparent unanimity. That answer is Yes. All this appears very simple. Mr. HARDY wisely desires to avoid, if possible, throwing the army again into the crucible of reform, accepts the principles asserted by Lord CARDWELL, and approved by Parliament, and directs the Committee to recommend whatever measures may be necessary to carry out honestly and effectually the system of local centres which should connect line regiments with particular districts and with the militia battalions in those districts. The late Government, having laid down the lines of a framework on which this organization should be constructed, appointed a Committee to carry out the details; the COMMANDER-IN-CHIEF accepted the conclusions arrived at in their Report; and a General Order was issued in 1873 whereby HER MAJESTY was "pleased to approve" of certain arrangements in connexion with the localization of the forces. One of those arrangements was the linking together of two battalions of the line for all purposes, including all new appointments of officers and enlistment of men. In respect of these matters the QUEEN ordered that the linked battalions were to "constitute one corps for 'all military purposes.'" Officers and soldiers appointed to the brigade, as the combined battalions of line and militia were called, were to be interchangeable between the line battalions of the brigade, and liable to serve in either of the two battalions, whether, at the beginning of their service, they had joined it or the other battalion. In accordance with these orders of the QUEEN, issued in conformity with the advice of her responsible Ministers, the various battalions of infantry were arranged two and two in the Army List, the names of all the young officers as they joined being placed on a single list common to both battalions. Had this course been steadily pursued, the old double lists would have faded away gradually, and the new single list would in time have contained the names of all officers belonging to both battalions, exactly as is now the case with any of the first twenty-five regiments on the Army List, which have all two battalions. The process would have been one of gradual assimilation, and no susceptibilities would have been wounded. One of the battalions was always to be abroad. In time of peace the other was to be at home, acting in conjunction with the dépôt common to both as a feeder of the battalion on foreign service. When one battalion came home, the other would take its place. In time of war, seeing that both battalions might be abroad, the dépôt was to be raised to the strength of from 600 to 1,000 men.

This is all very clear, and, being ordered by HER MAJESTY, was of course carried out in its integrity. Not at all. The Army List was soon restored to its old condition. The single list common to two regiments was abolished, and not a sign appeared to show that any reor-

ganization had been applied to the British infantry. The directions of the QUEEN remain ostensibly in force to this day, since there has been no alteration of the order; but, when we ask what is the difficulty, and why the Committee should have had to investigate this part of the subject at all, we find that the Duke of CAMBRIDGE has opposed the carrying out of the order, and "hoped that before it could possibly come into operation, it would be cancelled." This, then, is the secret of the second change in the Army List. HER MAJESTY issues a General Order to the army, carrying out the advice of her Ministers (which, we may add, was in accordance with the views of the great majority of army reformers), and every sign of obedience to it is effaced from the Army List, because the Duke of CAMBRIDGE hopes to have it abolished. There is no possible doubt as to the situation of affairs. His ROYAL HIGHNESS expressed himself so clearly in his evidence given before the Militia Committee that there is no room left for question. He does not wish the officers to be interchangeable, nor the battalions to become gradually assimilated, nor in fact that the Royal Order of 1873 should be carried into execution. "We have done very well as we are. . . ."

"Leave things alone, I should say." Unfortunately "things" cannot be left alone as they stand, because the legal position of the officers, as defined by HER MAJESTY'S Order, would come into collision with the wishes and intentions of the COMMANDER-IN-CHIEF; and the Committee find themselves obliged to give a verdict in as curious a case as we have seen for some time. What is their verdict? Enlightened by the past as to the fate likely to befall any scheme which gives the least loophole of escape, this Committee of essentially Conservative members, appointed by a Conservative Minister, not only reaffirm the former principles, but make such recommendations as will, if carried out, effectually close the controversy for the future. They advise that the two battalions of the line, the two or more of militia, and the depot, should be viewed as constituent parts of one body, and that such body should be "treated as one regiment," with a territorial title. And to this they append the declaration that it is impossible to enter fully into the consideration of details till this one point is settled. Thus every question connected with the subject hangs on a principle which was first laid down by a Minister of War, then worked out by a Committee appointed for the purpose, then ordered by the QUEEN to be carried into effect; and, when opposed by the COMMANDER-IN-CHIEF, is once more recommended, and that more emphatically than ever, by a Committee appointed by a new Minister of War, and containing members of the Horse Guards staff, as well as peers and members of the House of Commons.

Of course if the Duke of CAMBRIDGE were to press his point he would soon have a following, and the position of Mr. HARDY would become very difficult. Nothing can exceed the firmness of the Committee's Report. "We feel not the less bound to insist very strongly on our conclusions. Unless, therefore, it is determined to adopt a retrograde course by rescinding General Order 32 of 1873, we think that those portions of it which refer to the linking of regiments should be carried into effect in the same manner as the provisions of any other General Order." And in another place they say that "this order has not been acted on." Finally, they give in the appendix some pages of the Army List as it would stand if the order had been carried out. This being the state of affairs, what is to be done? The Report which has been presented to both Houses of Parliament by command of HER MAJESTY cannot be ignored, nor can it be said that the distinguished officers who served on the Committee are unaware of what is due to the feeling of *esprit de corps* in the army. But it is quite certain that the general good of the service, which means the safety of the country, must prevail over any *esprit* whatever; and, besides, we do not for a moment believe that there is any necessity for wounding the *esprit de corps* of a single regiment in any important particular. Why should not the regiments retain, for the present at any rate, their old numbers, if they are very anxious to do so? The Committee propose that they should retain all their old honours and distinctions, and it would really be too much to say that the army must remain disorganized because a few regiments object to be renumbered. But, as we have said, if there is any deep feeling on the point, or even if the Duke of CAMBRIDGE has set his heart upon the retention of the old numbers, let each battalion be known as it always has been, by number and distinctive title,

though forming part of a territorial regiment. There will be something rather absurd in such an arrangement, but most English reforms have to submit to some absurdities for the sake of compromise. In a few years all the men and all the officers will have become accustomed to the territorial organization, and will smile at the fancies that agitated their predecessors. According to the General Order of 1873 officers and men who joined the service within the last three or four years are now interchangeable between two battalions, and the number of them is already considerable. They will increase, while the old officers will decrease, and we may safely leave to another generation the completion of the task.

But we are inclined to ask whether there is not something altogether wrong in a spirit which can be invoked to throw difficulties in the way of military organization? We have heard of armies the officers and men of which dictated to the State, but we never heard of any advantage springing from such dictation; and, again, the jealousies of the component parts of the army might, if encouraged too far, be extremely prejudicial on service. Everybody knows how difficult it is for two allied armies to work harmoniously, and the same spirit on a smaller scale might be detrimental to the interests of the country and of the army at a critical moment. Not to speak of Austrian or other foreign armies, we have examples enough at home in the break up of Highland levies from the jealousy of clans, and the strong feeling excited when we had German regiments in England. *Esprit de corps* is no doubt a very useful force in its way; but there must be limits to it, or we shall presently have regiments objecting to serve in brigades or divisions. Each one will want to have a division to itself. There are also other facts to be considered. Not a regiment goes on foreign service, according to our present disorganization, without begging some volunteers to complete its strength from other regiments. And when Lord CARDWELL threw difficulties in the way of the exchange of officers from one regiment to another, what a hubbub was set up! So, then, corps feeling does not prevent the transfer of officers and men for their own pleasure or advantage, but no one, it seems, must touch them for the good of the service. We do not believe in all this supposed difficulty. The officers of infantry regiments are gentlemen and Englishmen before all, and they would not allow any slight feeling of annoyance to stand between them and their duty to the country, even if it were necessary to give their regiments new numbers, as has been done many times before now. We are sure that Mr. HARDY has only to be firm and all opposition will speedily vanish. If the point be not carried now we shall have thrown three millions and a half away, and the *esprit* of the country under such circumstances will not be agreeable to those whose perversity will have aroused it. But we hope better things. We cannot but believe that the Duke of CAMBRIDGE will even yet give a frank acceptance to measures on which the competent authorities have decided, and which have every claim on his loyal support and co-operation.

RAILWAY ACCIDENTS.

THE accident at Morpeth is of a kind more than usually alarming, not only on account of its fatal results, but because it seems difficult to assign it to any definite cause. The train was behind time, but it does not appear that unpunctuality had anything to do with the disaster. There is, too, a curve on the spot where the accident took place, which is sufficiently sharp to make it the duty of the driver to slacken speed. But all the evidence given before the CORONER concurs in showing that the train was going at a moderate rate of speed. There was nothing wrong with signals or points. The engine which left the track was quite fit for its work; and one after another of the usual causes of accidents may be excluded until we come to the state of the permanent way. An engine does not leave the track without some reason, and therefore the conclusion is inevitable that something was wrong in the permanent way; but what it was that was wrong was so doubtful that skilled witnesses had to resort to guesses or theories in order to make out to their own minds a plausible account of what took place. The matter is still under investigation, as the jury wished fresh evidence to be submitted to their consideration, and some fact may be elicited which will furnish a clue to what is

now wrapped in much, if not in complete, obscurity. Captain TILLY expressed a confident opinion that something was broken or out of place at the point of junction of two rails before the accident took place. The pressure of the engine did not do the mischief; but the mischief was prepared before the engine came up. Whether there were indications of possible mischief which ought to have attracted the attention of the Company's servants is the main point which the jury will have to decide, and it is impossible to anticipate what their decision will be. The evidence may show that such indications existed; but it is instructive to observe that men of knowledge and experience consider an accident possible without any indications of the kind being discernible. Mr. LAWS, a civil engineer of Newcastle, had been invited by the CORONER to inspect the scene of the catastrophe, and was asked what was his theory of the accident. He stated that he had carefully considered all that took place, and that he thought that the accident might not improbably have been caused by the weather. The rain soaking through the soil had lowered the sleeper, and the sleeper had lowered the joint. The engine jumped for want of solid support, and so got off the rails. This may or may not be the true account; but at any rate it is the account given by a professional man of long experience; and obviously if he is right, and human vigilance can be in this way baffled by rain, it is hopeless in such a climate as that of England to dream of complete safety in railway travelling.

On the other hand, it may be said that, even if it is conceded to be possible that causes so completely beyond human control as the weather may produce accidents on railways, experience has clearly shown that such cases are extremely rare. The causes of an accident are generally as clear as daylight, and all but a minute fraction of accidents can be clearly traced to the want of proper precautions. The statistics recently published by the Board of Trade show that in 1876 there were 57 collisions between passenger trains, 129 collisions between passenger trains and goods or mineral trains, and 57 collisions between goods trains; and collisions are not only of all kinds of accidents the most fatal, but are more incontestably than any others due to negligence. Preventable accidents are of constant occurrence; and no question can concern the public more nearly than the question how such accidents are to be prevented. Mr. GALT, one of the Commissioners appointed to inquire into the whole subject of railway accidents, has, in what is the most novel and instructive part of the Report, finally dispelled the popular illusion that Railway Companies must for their own sakes do all they can to prevent accidents, because they will have to pay crushing damages if accidents occur. Mr. GALT has shown that the damages which any Company has ever had to pay, even in cases of the most terrible accidents, bear such an infinitesimally small proportion to the gross receipts of the Company that dividends, and consequently the market prices of the shares, are practically not affected at all. It is much cheaper to have accidents than to take more than a certain amount of precautions against them. If then the Companies will not, from motives of financial prudence, do all that theoretically might be done to prevent accidents, can they be made by legislation to adopt precautions which they consider too costly? In a very halting and faltering way the members of the Royal Commission came to the conclusion that legislation to this effect was possible and desirable. The Government has announced that it is not its intention to bring in any measure this Session to give effect to the recommendations of the Commission, and, in a certain degree, there is nothing very surprising in this announcement. The whole subject is full of difficulties, which the labours of the Commission have done scarcely anything to remove. There was no real agreement between them, and although all signed the Report, this was only out of politeness and gentlemanly feeling towards each other, and those who had paid the most attention to the subject reserved for themselves the privilege of expressing their real views in supplementary documents. Mr. T. D. HARRISON, for example, whose professional experience is almost unrivalled, gave himself the amusement of going through the Report item by item, and exposing what seemed to him the transparent absurdity of the recommendations of the Commissioners. A Government certainly could not be expected to adopt recommendations relating to the whole subject of the administration and legal liabilities of Railway Companies without ample time for considering them: but it

may be regretted that an attempt is not to be made to deal with certain urgent and tolerably simple questions, which we have more than once pointed out as ripe for settlement.

The Commissioners tried to face the question whether a line can be drawn between the accidents which legislation can prevent and those which it cannot prevent. They all agreed that there was a very large number of accidents against which the Legislature can enforce no precautions. They started from the principle that the Companies must have the full responsibility of working their lines when once certain preliminary precautions have been adopted. Even if all the recommendations of the Commission were adopted, the public would be exposed to constant risk. For instance, in 1876 there were 880 failures of tires and 397 failures of axles; but the Commissioners all concur in thinking that legislation can do nothing to prevent tires and axles from failing. How tires ought to be constructed is as certain as any proposition in mechanics can be; but one great Company at least persists in using tires fastened in the wrong way, and the Commissioners content themselves with a mild entreaty that Companies will be kind enough to fasten their tires properly. All that the Commissioners think can be done by legislation is to compel Companies to adopt such obvious precautions as the use of the block and interlocking systems, the use of continuous breaks and continuous foot-boards, and the construction of ledges at public crossings. Mr. GALT indeed goes further, and thinks that Companies ought to be compelled to keep their permanent way and rolling-stock in good order; but in this recommendation he stands alone. The Government would, however, have to consider very carefully whether, if resort is had to legislation up to the point to which the Commissioners generally wish to carry it, the protection of the public would not require that legislation should be carried much beyond their proposals. But when legislation has done whatever may be supposed to be its work, who is to be entrusted with the delicate duty of seeing it carried out? With the exception of Mr. HARRISON, all the Commissioners think that the Board of Trade is not to be trusted. It would, in plain language, bully the Companies far too much. It would make requirements that would ruin poor Companies, and would force Companies with a small traffic to take expensive precautions that are only necessary when the traffic is very great. It would, if Mr. GALT's proposals are adopted, condemn rolling-stock which, though shabby, was serviceable, and would have views as to the permanent way too sublime for daily life. The Commission, therefore, recommends that a new tribunal shall be instituted, the province of which shall be to decide between Companies and the Board of Trade. This tribunal would consist of eminent men who really understand railways; and the Board of Trade, which is assumed to know but little about them, would attend in the capacity of a public prosecutor, and take its chance of getting a conviction. No doubt the invention has its merits; for it would greatly conciliate the Companies, and take away all dread of the tyrannical interference of ignorant officials. There is also a certain analogy between the functions thus assigned to the Board of Trade and those which it discharges with regard to the detention of merchant ships. But when it is proposed to carry out the principle of an appeal from a Government office on the immense scale which the supervision of railways would involve, a cautious Government cannot fail to ask itself anxiously how far this mode of arranging things is to be carried. The theory that there ought to be an appeal from Government departments to persons who really understand their business is evidently one of very wide application. There are many people who would very much like to be able to appeal from the decrees of the Local Government Board and the educational edicts of the Privy Council. The traditional maxim, to which Parliament has hitherto, with occasional deviations, adhered is that the limits of legislative interference shall be as narrow as possible, but that within those limits the officers of the Crown shall have real executive power. The augmentation of legislative interference, coupled with the institution of tribunals superseding and controlling the action of the officials of the Crown, might be a popular, but it would certainly be a startling innovation.

VICTOR HUGO AND M. LOUIS BLANC.

M. VICTOR HUGO and M. LOUIS BLANC appear occasionally on French platforms, somewhat as Bright and Mr. GORDEN used to appear a generation ago on English platforms. The difference, however, between the two speakers is very much more marked. Mr. Bright's eloquence rose to a higher pitch than Mr. Gordon's, but it never soared into that region of the pure ideal in which M. VICTOR HUGO habitually lives. Unfortunately the great French poet mistakes himself, and is anxious to be mistaken by others, for a practical politician. The extraordinary rhapsody of which he delivered himself at the Chateau d'Eau Theatre on Sunday has only made its way into this country through the medium of the *Times* Correspondent. But even beneath all the disadvantages of a hurried newspaper translation it is possible to recognize the materials of a poem of great force and beauty. The conclusion, in which M. HUGO describes the voyage of Progress, bears about the same relation to politics that the song of the "Bay of Biscay" does; but, with the necessary change in the form, it might be poetry of a high order. The misfortune is that M. HUGO seems to intend it for good common sense. At the first glance the main argument of his speech, that kings desire war and peoples desire peace, seems to be strangely inappropriate to the present condition of affairs in Europe. The English Government has been busy for some weeks past in providing the Emperor of RUSSIA with an excuse for not going to war which he can present to his people with some hope that they will think it sufficient. The Sultan of TURKEY is supposed to be willing to make almost any concessions that the Powers might ask of him, if he were not afraid of being murdered by his subjects for his cowardice in making terms with unbelievers. Here, at all events, are two conspicuous exceptions to M. HUGO's dictum; two cases in which it is kings who wish for peace and peoples who wish for war. It turns out, however, that when M. HUGO talks of the peoples as wanting peace, he puts a sense of his own upon the phrase. The peoples want peace on condition that they first get their own way in everything. It does not appear to strike M. HUGO that upon this condition kings, even kings as he paints them, would want peace too. The two Sovereigns who represent to M. HUGO all that is horrible in contemporary history, the Emperor WILLIAM and NAPOLEON III., would never have wished to fight one another if they could have settled everything to their mutual satisfaction on easier terms. The peoples, according to M. HUGO, desire every disarmament except the disarmament of conscience. By "every disarmament" he means that in religion reason must replace intolerance; that in punishment correction must replace vengeance; that in social matters comfort must replace straitened circumstances; that in international politics arbitration must replace war. When all these triumphs have been achieved, then conscience may disarm. But, so long as any of these ideals remain unrealized, so long as politics include war and judicial force the scaffold, so long as there is no amnesty for the conquered and no justice for the oppressed, conscience must remain armed and oppose incorruptible right to iniquitous law. The meaning of all this seems to be that, until M. HUGO and his friends have abolished every institution they dislike, they intend to keep their weapons and to use them as opportunity offers. M. HUGO's love of peace does not, after all, amount to very much. If he only abandons war when he has reaped the whole harvest that war could possibly yield him, what thank has he? Do not even kings and emperors the same?

A speech of M. HUGO's would not be complete without a passage in glorification of Paris. She appears on this occasion as the capital of the world, sacrosanct, the capital of France, as the city of light, helping the city of labour. This is M. HUGO's mode of describing a collection among the workmen of Paris, or so many of them as came to listen to M. HUGO's eloquence, on behalf of the workmen of Lyons. In his poetical capacity M. HUGO has a perfect right to christen the two chief cities of France by any names he pleases. But when he is speaking in prose, and still more when he is speaking before an audience composed entirely of Paris citizens, it is strange that it does not strike him that the line between poetical prose and ordinary prose is at present very slightly marked. If M. Baniab, who at present, every day, is busy with slave-dealing and usury, were to say, "we should not class. Innumerable works on the same," we should not

quarrel with him for preaching the merits of the Paris workmen. They have their good points, and they are points which a Conservative Chamber is very likely to lose sight of. But the language in which M. HUGO speaks to them would be more becoming if he were addressing a company of angels—pure ethereal spirits who have never fallen from their first innocence, nor entertained a thought that was inconsistent with the most exalted conceptions of duty. The most impracticable and fickle city in France does not quite deserve to have these praises showered upon it without stint or qualification.

M. LOUIS BLANC spoke in a more measured and rational strain. The subject of his address was the English Poor-law, and his hearers probably regarded their presence in the theatre as the price to be paid for getting good places in which to listen to M. VICTOR HUGO. M. LOUIS BLANC seems to have described English pauperism from the point of view of the "Amateur Casual." He has probably not had many opportunities of studying the later aspects of the question, and he is apparently not at all alive to the importance which the abolition of outdoor relief has of late assumed in English Poor-law discussions. He admits that, if labour could be regulated with mathematical accuracy, able-bodied pauperism would deserve no consideration; but he thinks that a system which treats destitution as a crime is intolerable so long as able-bodied pauperism is produced by accidents, disease, and want of employment. We are not concerned to dispute this reasoning, because the English Poor-law system does not treat destitution as a crime. It treats it rather as a misfortune which may be very easily simulated, and which, if simulated, can only be detected by a discipline sufficiently rigid to make the workhouse an unattractive place for any one who can support himself outside it. It is noticeable that M. LOUIS BLANC, speaking as a Frenchman to Frenchmen, made no reference to the point in which his countrymen are commonly considered to be so immensely superior to the English poor. He drew no comparison between the thrift for which the French are remarkable and the want of thrift which is an almost equally conspicuous characteristic of the corresponding class in this country. He had the good sense to admit that the abolition of poverty is too difficult a problem not to be approached with modesty, prudence, and even distrust; but he said nothing upon the point which he might have been expected to treat with real knowledge and appreciation—the different aspects which that problem presents in France and England. Good laws and institutions may indirectly do a good deal to diminish poverty, but it can only be by increasing the disposition to lay by the fruits of industry. Any change, however beneficial in itself, that stops short of this result, may effect a momentary improvement in the condition of the working class; but it will leave them just as unprotected as ever against the reaction which is sure to set in as soon as the circumstances which have brought about the improvement cease to operate.

THE SELECT COMMITTEE ON FLOODS.

IT is an ill wind that blows good to nobody, and the floods of the past winter have at all events brought with them a Select Committee. Hopes are even held out that, if the Select Committee does not find out all that can usefully be known on the subject, it may be followed by a Royal Commission. On the whole, there is no reason to be discontented with the form which the inquiry is to take in the first instance. Select Committees like to present their Reports by the end of the Session in which they have been appointed; whereas Royal Commissions occasionally seem to forget the flight of time. A well-chosen Lords' Committee is an excellent instrument for getting at facts; and it will be able to command the testimony of as many experts as it may find necessary to examine. What is less satisfactory is the slight reference made in the Duke of RICHMOND'S motion—there was rather more about it in his speech—to the question of village water supply. The impression which a subject makes on the public attention bears no relation to its real importance. The suffering caused by a flood is probably not half so great as the suffering caused by the droughts which seem to be a regular part of an English summer, or by the want of wholesome drinking water, which in many districts is felt all the year round. But, to all appearance, if there had been no floods, there would have

been no Select Committee. When an inquiry is to be made into the best means of preventing floods, it is impossible not to give the storage of water a place in it; and as the storage of water is only one among many means of supplying villages with something to drink that is not sewage, there is a chance that the Committee may be drawn on until, by the time that their labours are ended, the inquiry has become very much more comprehensive than the terms of the instruction promise. We should have preferred to see the coequal importance, to say the least, of the question of village water supply formally recognized in the order of appointment. It is better, no doubt, that it should come in incidentally than not at all; but, so long as it has no recognized place in the inquiry, there is always a danger that the Committee may be disinclined to enlarge the scope of their proceedings, and may reject a great deal of evidence which, though it would have been strictly pertinent to the larger investigation, can only come on sufferance into the restricted one. The best thing to do at present, therefore, is to consider on what plea the Committee may be induced to examine witnesses, whose information relates to village water supply as well as those whose information is limited to floods.

If the order defining the matters with which the Committee are to deal had made no mention of the authorities into whose constitution and functions they are to inquire, this would be an easier business. As the words stand, however, village water supply seems, at first sight to be altogether excluded. The only authorities mentioned are Commissioners of Sewers and Drainage and Navigation Boards, and it cannot be denied that the natural meaning of these terms points to an inquiry limited to the means of disposing of the superabundant water with which rivers are burdened in time of flood. For example, in the Thames Valley the Thames Conservancy will answer to this description; but what has the Thames Conservancy to do with the water supply of villages lying at a distance of many miles from the river-bank? It exists to see that the channel of the Thames is kept free from obstruction, and that the locks and weirs which make navigation possible are in a state of decent repair. Clearly no inquiry into the present constitution of the Conservancy Board can be of much use as regards matters so distinct as a supply of water for domestic use and a supply of water for the purpose of carriage. Nor, supposing that the Committee placed a very liberal construction on their instructions, would it be expedient to treat the Thames Conservancy as a body to be invested with large additional powers in this way. To lay upon them the duty of supplying the Valley of the Thames with water would be to assign them a duty to the discharge of which they would be in no way suited. The supply of water cannot be separated from the supply and regulation of other sanitary needs. The authorities that have the management of the one must have the management of the other. If therefore the Select Committee are to extend their inquiries to the question of water supply, they must go beyond the authorities mentioned in the Duke of Richmond's motion. Whether they shall do so will naturally be decided by their estimate of the importance of the subject, and from this point of view it may be useful to recall the disclosures of the last few years with regard to the drinking water of villages. No doubt if this were suddenly made all that it ought to be, some new causes of ill health would disclose themselves; but it is scarcely too much to say that epidemic diseases as we know them would almost disappear. Whenever there is a more than ordinarily conspicuous outbreak of fever in a village, the Local Government Board sends down a Medical Inspector to investigate the causes of it. The results of these inquiries are annually published by the department, and in almost every case it proves to be the water supply that is in fault. "Sewage pollution" is the phrase that occurs with sickening regularity in these documents. The villagers have gone on drawing their drinking water from sources which may have been pure when the village was a fourth of its present size, but which have long ceased to be pure. It is the only water within their reach, so they have no choice but to drink it; but so long as they do this they are exposed to a certain outbreak of typhoid or cholera if a single example of either disease finds its way into the village, and to the deterioration of health which probably results from a long course of sewage-poisoning even when sewage is not impregnated with any specific epidemic poison. The reports of the Officers of Health to the various

rural authorities amply confirm the reports of the special Medical Inspectors. The more the subject is looked into the worse the facts appear to be.

We submit that this is a state of things which will fully justify the Lords' Committee in giving a very free interpretation to their instructions. It would have been better, of course, if the Government had included the water supply of villages among the objects of the inquiry; but, as they have not done this, the next best thing is for the Committee to make the addition for themselves. They can manage this, if they are so minded, under cover of the words "storage of water." This is expressly named as one of the points which they are to investigate, and the storage of water will be mainly useful as a contribution towards the solution of the problem of water supply. It is true that impounding reservoirs are among the means that have been suggested for regulating the discharge of the flood water through the rivers. But if this were the only reason for making reservoirs, it is very doubtful whether they would ever be made. The expense of storing water in this particular way is very great, and unless the reservoirs were built on an enormous scale they would scarcely exercise an appreciable effect upon a flood. Storage of water, in the natural sense of the words, means storage for the use of a village; and if once this is conceded, it will be idle to examine the merits of competing schemes without considering what other sources of water supply are available. It may turn out that to divert the sewage from the neighbouring watercourses or to dig new wells at a greater distance from the cesspools would provide a sufficiently pure source from which water may be drawn. If, therefore, the Select Committee inquire into the storage of water, their labour may be entirely wasted if they do not inquire at the same time into the means by which the storage may be rendered unnecessary. The Duke of Richmond, in moving the appointment of the Committee, implied that the provision of water for villages was somehow to be included in the investigations of the Committee; but he seemed to regard storage as the only machinery the merits of which it was necessary to consider. It happens that among the districts that have been most conspicuously flooded during the past winter is the country between Brent Knoll and the Bristol Channel, and nowhere are the villages worse supplied with drinking water. But if the Committee were to recommend the storage of water in order to save these villages from drought, they would be ignoring the existence of springs on Brent Knoll which would yield any quantity of pure water if there were only some authority to lay down pipes for its conveyance. Here is a sufficiently pertinent example of the mistake of making the scope of the inquiry too limited. Happily it is not too late for the Government to add words including the water supply of villages among the specific objects of the Committee's investigation, and this would clearly be a better way out of the difficulty than the most ingenious device for bringing in the question by the head and shoulders.

A MODERN "SYMPOSIUM."

THE ingenious editor of the *Nineteenth Century* has hit upon a new form of article which it may perhaps be difficult to keep up to a high standard, but which is certainly interesting as a curious presentment of the very different meanings which may be attached to words, and the different approaches by which men are able to arrive at what, when expressed in very general terms, seems to be pretty nearly an agreement of opinion, although, in fact, it is only a covering for a variety of interpretations. The plan of the "Symposium" is that questions are from time to time to be discussed in turn by a group of contributors, each firing off a brief discourse something after the fashion of the ten-minutes' argument on each side which used to be practised by street-preachers and their opponents, and which was lately revived at the so-called Conference in St. James's Hall, to the dismay and confusion of some naturally long-winded orators. Whether this brief, fragmentary sort of debate is calculated to lead to results either exhaustive or decisive may be doubted; but it will show in a striking way the round of opinion. The subject which has been chosen for the first performance is "The Influence upon Morality of a Decline in Religious Belief." It is, we should think, a very trying one for those who have to exhibit in this manner, and it is hard to imagine what impression is likely to be left on the mind of the average reader on coming to the end of the controversy.

Sir James Stephen, who begins the bout, states the issue which, he thinks, has to be considered—whether morality is dependent on religion, or has a basis of its own in human nature. Sir James himself

holds that both these views are to a certain extent right—that is to say, that the prevalent theology, whatever it may be, of any age or country must have an influence on the moral rule of life; but that, on the other hand, morality has a source of its own quite independent of theology; and from this he draws the practical inference that theology and morality ought to stand to each other in precisely the same relation as facts and legislation, it being at least as unlikely that false theology should produce good morals as that legislation based on a mistaken view of facts should work well in practice. Consequently, in his opinion, the support which an existing creed gives to an existing system of morals is irrelevant to its truth, and the question whether a given system of morals is good or bad cannot be fully determined until after the determination of the question whether the theology on which it rests is true or false. If the theological basis involves a false estimate of the consequences of human actions, then the morality resting on it cannot be good; while, on the other hand, the circumstance that such morality is supported by theology is an argument against and not in favour of the latter. Lord Selborne follows, it need hardly be said, from a very different point of view. He lays down as the result of general observation of mankind that “morality has not flourished amongst either civilized or uncivilized men whose religious belief has been generally lost or utterly debased”; and that, as an historical fact, the place which the principles of love and benevolence, humility, self-abnegation have assumed in the morality of a large part of mankind is specifically due to Christianity. He therefore believes morality in any thorough, genuine sense to be inseparable from religion; and urges that freedom of inquiry, if it led to the rejection of religious belief, must gradually extend itself to the whole circle of morality, “most, if not all, of which is as little capable of demonstrative proof through the evidences of the senses as any of the doctrines of religion.” Hence, those who set aside religion will not voluntarily submit to moral restraints founded upon religion unless such restraints can be placed upon some other intellectual basis sufficiently cogent to themselves to resist the attractions of appetite or self-interest; and he thinks that this is not to be obtained either by the modern notion of duty, or by the principle that a man should pursue his own happiness in this world as the aim of life. The latter would tend to a cold, calculating character, and would establish a low standard of virtue, perhaps only to the extent of checking and imposing limits on tendencies to vice. In fact, he brings it to this—that the mere application of right reason to human conduct cannot be considered a law of nature without including in the idea some kind of moral sense which can only have its root in religious belief. He admits that to a certain extent there is a moral instinct, as there is a religious instinct; but “those principles of thought which explain away the one as having no proper objective cause, and as indicative of no objective truth, may as easily explain away the other also.” Thus, although some men who reject “all dogmatic theology, and even the principles of natural religion,” do nevertheless live up to a high moral standard, experience on the large scale shows that “men who disregard the religious cannot generally be trusted to pay regard to the moral sense.”

The third speaker is Dr. Martineau, whose well-known ethical tenets forecast his view, which may be stated as follows. A sense of duty is inherent in the constitution of our nature, and cannot be escaped till we escape from ourselves. Morals have their own base, and are second to nothing; and theology cannot supply a base for morals that have lost their own. But it does not follow that the moral sense, because indigenous, is therefore self-sufficient. Religion has to come in “as the open blossom of the moral germs implanted within us—the explicit form, developed in thought, of faiths implicitly contained in the sense of responsibility and the foreboding of guilt; its effect, therefore, is to suffuse with a divine light relations and duties which before were simply personal and social.” The practical effect of a decay of the Christian type of religion is assumed to be “that morality would lose, not its base, but its summit, and that the ground and principles of duty would remain,” Christian ethics being true to human life and the expression of right reason. On this ground the form and substance of a moral system would “not be essentially modified by the decline of religious belief.” Yet, although a rule of life might be acknowledged in common over the whole range of social duty by persons simply ethical, and by those who are also religious, the decay of religion would leave the institutes of morality intact, and drain off their inward power; and hence the necessity of religious faith to intensify and sustain the moral nature, inducing the mind to look “upwards to an Infinite Perfection, whose presence it never quits, and thus supplies the true conditions of humility, of aspiration, and of felt equality of moral trust for all men before God.” Mr. Frederic Harrison, who “follows the teaching of Comte,” says that the impression he derives from what he has heard is that it represents the moral characteristics, not of the Christian, but of the religious temper; and that he thinks for the words “Theology” and “Christian” should be substituted “Religion” and “Human”; and further that, “for the intrinsic consciousness and emotional intuitions whereby these are said to prove themselves, we must substitute the reasonable proof of science, philosophy, and positive psychology,” and that, in the end, a purely human base would be accepted for morality, while it would be “transfigured into a true religion.” Morals, he holds, belong to a strictly human world, but “theology places religion in a non-human world, and thus the human system of morals may possibly be disturbed by non-human religion”; whereas human religion

would be “the soul of our morality, the ideal of our imagination, the fulfilment of our aspirations, the lawgiver, in short, of our whole lives.” The lesson which Mr. Harrison draws from this is that morality is independent of theology, and is gradually superseding it as a religion which is non-theological and a fact in human life.

The Dean of St. Paul's, who comes next, reduces the question to a very practical issue, pointing out that, till it is presented in a concrete historical form, nothing can be made of it. Before he can attempt to answer it he must know, at least approximately, what is the morality and what the religion implied. His own belief is that religion, “in the sense of truthfulness, honesty, humanity, purity, self-devotion, kindness, justice, and fellow-feeling,” has, as a matter of fact and history, synchronized in its growth and progress with Christianity; and whatever might be the effect of other influences, “the removal or weakening of such an important factor as Christianity must seriously affect such departments of morals as purity, the relations of strong to weak, respect for human life, and slavery.” The Duke of Argyll confines his remarks almost exclusively to an analysis of Mr. F. Harrison's argument, which he regards as the language of theology, and of nothing else—“language which may be held consistently with a great variety of creeds, but is inseparable from those fundamental conceptions which all creeds involve.” Professor Clifford winds up the debate by arguing that virtue is a habit, not a sentiment, or an *ism*, and that “the spring of virtuous action is the social instinct, which is set to work by the practice of comradeship,” and by protesting against submitting human life to clerical control. This is, of course, substantially the Comtist idea; and if the hierarchy ever got real power in the world, it would, judging from the tone which its leading members adopt in this country, be difficult to conceive a more tyrannical and crushing form of clerical despotism than would then be established.

In reading this debate, what will probably strike most readers is, as the Duke of Argyll remarks, that, considering that the various papers are contributed by men belonging to very different schools of thought, and that they deal with a question very abstract and ill-defined, it is remarkable that so much agreement should emerge on certain fundamental points. The reason of this, however, is obvious on the surface, being simply that the elements of the question are, first, as the Duke justly observes, very abstract and ill-defined; and, next, that it is treated in a broad general way in vague phrases which scarcely touch the essential elements of the controversy. The apparent agreement which is thus produced is only arrived at by the various contributors confining themselves to the general aspect of the subject, and to expressions which have no definite or specific meaning. Oddly enough, Mr. Gladstone was not of the circle; but, if he had been, he would no doubt have given a still more striking proof of the perplexing vagueness and obscurity of language, even when used by men of intellectual power and high culture. It will certainly seem to most people that all the fine talk of the chosen *illuminati* is a mass of words with very little meaning, and that the problem they undertake to solve remains very much where it was, simply because they have dealt with it in too general a way, and without giving plain definitions of the sense in which they use certain words. In fact, the deliberations of the “Symposium” bear a very strong resemblance to those of the diplomats who have been lately concocting protocols; that is, they consist of empty phrases to which all the parties can agree, because they do not touch any of the points on which the co-signatories would be likely to differ. In one sense, no doubt, the question proposed for discussion may appear to be a very simple one. It is idle to argue whether theological belief has any influence on morality. There can be no doubt that it has exercised such influence in the case of all races and religions. As Sir James Stephen puts it, “the difference between living in a country where the established theory is that existence is an evil, and annihilation the highest good, and living in a country where the established theory is that the earth is the Lord's and the fulness thereof, the round world and they that dwell in it, has surely a good deal to do with the other differences which distinguish Englishmen from Buddhists.” It may also be said that theological ideas are a universal and permanent element of human nature. Every creature possessing the most primitive capacity of thought has some notion of some mysterious over-ruling power or influence which it is necessary to take into account in regard to life and conduct. It may be a spirit of infinite benevolence, or only a mere bogie of terror, but in one form or other the idea everywhere exists. Everybody has a religion of one kind or another, and even the non-religious people erect their unbelief into a faith to which they adhere as devoutly as the orthodox classes. On the other hand, while the religious sentiment is in this way universal, there is an infinite variety of kinds of doctrine, and, in fact, there are not two persons who can entirely agree with each other in the interpretation of all the dogmas of their faith. They agree about some and differ about others; and even in a civilized society the prevailing ideas are very indistinct and confused. All the same, it is unquestionable that there is a general religious sentiment which operates very powerfully on human minds of every grade, from the highest to the lowest, and which must therefore have a certain effect in framing public morality. It is obvious that a man's morality will at least tend to take shape in accordance with his theological views, and it is easy to conceive that among the various theological systems there are some which on the whole are beneficial, while others are

calculated to do harm in some respects, and perhaps to do more harm than good.

It will be seen, therefore, that to consider religion only as a general sentiment leads us a very little way; and, as Dean Church said, the question must first be decided what sort of religion and what sort of morality is meant; and it is on this point that the members of the "Symposium," as it seems to us, break down. Sir J. Stephen contents himself with defining theology as "the generally accepted theory of the universe in any country or age," and morality as "the rules of life then and there commonly regarded as binding." Lord Selborne explains that it is no part of his purpose to enter into an examination of any question as to particular doctrines of theology. Dr. Martineau confines his attention "to the Christian type of religion, which has its hold upon our nature from the moral side." Mr. Frederic Harrison merely substitutes one word for another—"Religion" for "Theology," and "Human" for "Christian." "What is new in our scheme," he says, "is merely that we avoid such terms as Infinite, Absolute, Immaterial, and vague negatives altogether, resolutely confining ourselves to the sphere of what can be shown by experience." The Dean of St. Paul's holds that morality has synchronized in its growth and progress with Christianity; and there can be no doubt as to which form of Christianity he prefers. But in his argument he looks at Christianity in general, and does not touch the question as to the comparative influence of different Christian creeds on morality. In fact, the weak point of the whole discussion is that it does not recognize the fact that religion includes an almost infinite variety of types, and that even members of the same religious community are usually much divided in their opinions as to what their formal doctrines actually imply. A general spirit of religion must, of course, be a good thing, and there is no likelihood of sound morality without it. But this is different from the question as to what is the effect of different kinds of religion on public morals; and this is the point of the whole controversy. It may be said that, as a rule, among ordinary people the principles of morality are a more settled thing than theological faith; that morality, being essential to social order and cohesion, has an independent basis apart from the particular theories of theology; but, in the end, it must be evident to every thinking person that religious conviction and a religious bent of mind is indispensable to a high ideal of moral life, and that it operates like the "leaven which a woman took and hid in three measures of meal till the whole was leavened."

DR. SCHLIEMANN ON MYCENÆ.

DR. SCHLIEMANN'S interesting address to the Society of Antiquaries last week left the meaning of the discoveries at Mycenæ in the condition of a fascinating puzzle. He did not bring the actual treasures and relics with him, and the photographs which he exhibited hardly justified, in the opinion of many of his hearers, his own enthusiastic descriptions. As works of art, the breastplates, crowns, and so on seem to be less beautiful and delicate than Dr. Schliemann's letters to the *Times* had led people to imagine. "Splendid" was held to be not exactly the right word for spiral designs of a rather rough-and-ready sort. None of the work came at all near the admirable Phœnician bowl from Prieneste which has lately been engraved in the *Gazette Archéologique*. The spirals copied by the artist of the *Illustrated London News* (March 24), for example, show no great subtlety of invention. In short, far from rivaling the skill and beauty of early Etruscan or Phœnician jewelry, it may be questioned whether a closer parallel to the Mycænæan ware might not be found in the artless products of the Ashantees. There is a certain *naïveté* in the barbaric gold of that rather backward people, and especially in their golden masks, which we commend to the notice of Dr. Schliemann.

The Mycænæan jewelry raises the great question of the date of the tombs, a question as to which it is really difficult to make even a guess. Dr. Schliemann would have them almost contemporary with the age of the poet of the *Iliad*. With that eager faith and enthusiasm without which he would never have overcome the difficulties of his task, he wishes to think that "Homer lived in Mycenæ's golden age, and at or near the time of the tragic event by which the inmates of the five sepulchres lost their lives." We need scarcely stop to refute this opinion out of Homer, and to show that he looks on the heroic time as a distant period. No iron was found by Dr. Schliemann at the depth of the pre-historic city, and Homer, with Mr. Gladstone's permission, is very familiar with iron. Moreover, by Dr. Schliemann's own statement, the art of Mycenæ is uninfluenced by Oriental example; whereas in Homer there is constant mention of Phœnician and other Eastern art, which must almost necessarily have had its effect on that of the Achæans. But there really seems to be at present no chance of determining the stage of artistic culture in which the various objects were produced. The gems, for example, were not thought to be all of one period. Some of them are said to be debased indeed, but not, strictly speaking, rude and primitive. They are thought to show signs of the handling of artisans who were in possession of proper tools, but who had lost the traditions of the art and all artistic spirit. These gems would be on a level, if this view is correct, with some of the efforts of modern India. It is difficult to understand how works of this debased sort could be contemporary with the *naïve* barbaric character ascribed to the

gold ornaments, the mere rough sketches of a race feeling its way in the direction of art. Other gems, again, were held to be of much more æsthetic value, but could scarcely be ascribed to the early date to which Dr. Schliemann rightly, as we think, insists on referring the tombs and the gold-work. It is admitted, too, by way of making things even more perplexing, that the famous "cow's head" of silver, with gold horns and traces of gilding, is a work full of spirit and of good execution. The unpleasant suggestion has been hazarded that the "cow's head" is really a bull's head. This breaks the connexion with Io, and the old derivation of Mycenæ from *μυκίομαι*. Against the art shown in the head must be set a much lower estimate of the engravings on the tombstones. The spiral ornamentation on the upper part of the slab is said to be childishly rude, whilst the figures of a man in a chariot and of other men in various attitudes are no less barbaric. Indeed the description of these sepulchral stones inevitably reminds one of Schoolcraft's drawings of the grave-posts of Red Indian chiefs. Matters do not become clearer when we remember that these remains of a very crude and apparently almost savage state of art are found within ruins so massive as to attest the presence of a comparatively powerful and advanced civilization. On the most favourable estimate some of the smaller relics can hardly be classed higher than the work of ancient Peru, where, as it happens, there are ruins of architecture that might be called Cyclopean. It should follow that, whatever may have been the date of the tombs, it was long prior to the time in which Homer was well acquainted with the admirable examples of Oriental art.

In his lecture at Burlington House Dr. Schliemann said less than might have been desired about the very curious concentric circles of stones within and beneath which he found the tombs. The positions of these circles may best be understood by reference to a drawing in the *Illustrated London News*, March 24. Conceive two circles of erect gravestones, the inner distant not quite four feet from the outer. The space between was once, it is thought, bridged over by a flooring of stone, and the whole would then form a circular stone bench. No one can help being reminded of the description of the trial in *Iliad* xviii. 503:—

οἱ δὲ γέροντες
εἶα' ἐπὶ ξυστοῖσι λίθοις, ἱερῷ ἐνὶ κύκλῳ.

It is natural to conjecture that the stone bench at Mycenæ was an agora of the heroic age. Thus, if Dr. Schliemann has done nothing else, he has confirmed the correctness of the local colour of Euripides. Eustathius refers us to the *Orestes*, where Euripides speaks of a peasant as *ὀλεγάκις αὐτὸν καγοῦσι χραίων κύκλον*. Mr. Paley, in a letter to the *Times*, has noticed that Euripides may have spoken of what he had seen at Mycenæ, and the commentator on the *Iliad*, who thinks that the poet took the idea of the *κύκλος* from Athens, may have been hasty in his criticism. In the *Odyssey*, Nestor sits down on one of the polished stones in front of the house, "and all his sons were gathered about him." It has been suggested that the "sacredness" ascribed to the circle in which the elders sat to give judgment may have been derived from the tombs of the ancestors beneath their feet. But in Homer so many things are sacred or "divine," that little stress can be laid on this idea. Mr. Paley's quotation from Pindar (*Pyth.* v. 95) is more to the point:—

ἄτερθε δὲ πρὸ δαμάτων ἔσσιτο λύχοντες αἰδαν
βασίλεις ἱεροὶ
ἐντρί.

("Apart, before their palace, lie other sacred kings, that have their lot with Hades.") But Pindar is here, it must be noticed, distinguishing between Battus's sepulchre "in the forum" of Cyrene, *πρῶτοις ἀγορᾷ ἐπὶ δίχῃ κεῖται θάνατο*, and the sepulchre of later kings in front of the palace. Battus, as the founder of Cyrene, had the more honourable grave; but it would not at all suit Dr. Schliemann to have it thought that the inmates of his tombs within the forum were the founders of Mycenæ. Still it must be satisfactory to him to find that the evidence of ancient poetry explains his discoveries in a rational way. He has a right to throw the burden of proof on his more sceptical critics, and to ask them to decide what the circle of stones may be, if not the "sacred circle" of the agora, and what the graves, if not the graves of the most ancient worthies of Mycenæ. To go beyond that, and insist on Agamemnon, on a given date, and on the contemporary existence of Homer, is to pass into a region of pure conjecture, where one opinion is nearly as good as another. In the meantime there can be little risk in guessing that the age of the tombs is long anterior to the age of Homer and of Greek perfection in epic poetry. Very possibly the incidents of the royal burial may have grown, by lapse of time, into the germ of the legend of Agamemnon. But that possibility would not justify us in identifying the barbaric chief whom Dr. Schliemann unearthed with the Bretwalda of Argos and the Isles whom we read of in Homer. We see by the analogous example of the French cycle of *Chansons de Geste*, how the exploits of his predecessors and of men who followed him, of purely mythical beings and of the characters of later romance, were piled together to add to the honour of Charles. If the history of the tenant of the grave of Mycenæ was the germ of the Achæan epic, it is probable that the legends of his successors and a great deal of myth borrowed from all quarters were combined in the imagination of the poet who told the tale of Troy and of the treason of Ægisthus. In the stately unity of the epic a thousand fables and myths

are blended with legend, history, and tradition. The figure of Agamemnon, as we know him, rises from the mould in which the genius of Homer fused all the intellectual wealth of his time. To speak of his tomb at Mycenæ is like speaking of the tomb of Arthur, or that of Zeus which was shown in Crete. He is not there, nor elsewhere, though it is satisfactory enough to know that the agora of his ancient city held the grave of some chief of the ancient world. To modern archaeology the thought of a world so distant as that in which Hellas was barbaric seems almost distressing. People do not like to look into the savage origins of a race whose eager spirit swiftly burned away all that was gross and uninspired in their early culture. They do not even care to be told that before Hellas was Hellas a perhaps alien tribe, Pelagic or what not, and not gifted with Hellenic delicacy, possessed the rock of Mycenæ. Dr. Schliemann himself evades these ideas by persuading himself that the objects which he has discovered are worthy to represent the early art and the golden world of Greece. In his opinion the gold-work is still work of that beautiful Achæan civilization which the Dorians swept away. In his eagerness to come near Homer he has, we think, forgotten to tell us where he has laid the half-consumed bodies which he unearthed. The question cannot but cause some anxiety. If he is to go on at his present rate, the Greek Assembly will have to pass a Mythological Monarchs Burial Bill. Minyas or Oedipus cannot be allowed to lie loose in a museum.

THE BOAT-RACE.

THE curious sort of madness which for years past has taken possession of men, women, and children in London on the subject of the annual boat-race between Oxford and Cambridge has not shown any symptoms of diminution. Enthusiasm was indeed on this occasion a somewhat cheaper luxury than usual. It is not difficult to find valid excuses for not getting up at five o'clock in the morning; and it is perhaps as pleasant to a person lying comfortably in bed to think of the manful exertions of two opposing crews rowing on a cold river as it is to one standing on the shore to watch the troubles of those on the great sea *turbantibus æquora ventis*. On the other hand, a certain number of people must have been exposed to bitter disappointment by the unexpected change in the time of the race. To get up at six o'clock on an unpromising morning, congratulating one's self on one's resolution and punctuality, and to find that unkind chance has interfered to make the exercise of these qualities fruitless, cannot be a pleasant experience. There is this, however, to be said in favour of making the race as early as possible, that the more inconvenient the hour is for spectators the less danger will there be of the whole business of the race degenerating into the kind of gigantic fair which it has of late years become. One might have thought that when every London street-boy took to decorating himself with a dark or light blue ribbon in honour of the race, sensible people would have seen that the excitement about it had reached the point of absurdity, and would have done their best to discourage its extravagances. So far from this, the mania has grown steadily worse. People who ought to know better have given themselves up to the prevailing folly with a kind of Bacchic self-abandonment. The question whether nine young men from Cambridge can propel and steer a boat to the end of a course quicker than nine other young men from Oxford has been considered by many as if it were of far more importance than the fate of nations; while many more have made the occasion of its decision the excuse for a kind of daylight debauch. It has been thought necessary to display the colours of one or other University whether their wearer has or has not the slightest interest in either. Cases have been known, indeed, of girls going to the race provided, like Talleyrand on a graver occasion, with a double set of colours, and assuming the dark or light set according to the event, which is a shocking instance of the demoralizing effect of factitious enthusiasm.

The matter has, however, its serious side. Without wishing to say a word in discouragement of the healthy love of outdoor sports, or to adopt to their full extent the theories put forward by Mr. Wilkie Collins in *Man and Wife* as to the dangers of athletic pursuits, we yet must think that there are certain grave objections to the ridiculously exaggerated importance which the Oxford and Cambridge boat-race has assumed. It has been suggested by a philosopher who takes a somewhat cynical view of human affairs that to the successful keeping up of any pursuit of wide interest the constant sacrifice of a certain number of victims is necessary. According to this theory, the science of mathematics is preserved and improved at the cost of the development into Senior Wranglers of men who, having trained themselves to this one end, are never fit for anything else; and in like manner the theory and practice of rowing demands the annual sacrifice of men who ruin themselves by over-training. It would not be difficult to adduce against this proposition examples of men who have been both Senior Wranglers and University oars, and have distinguished themselves in after life; and it is well known that, at Cambridge at least, mathematical men are accustomed to find their relaxation in rowing. The combination, however, of a Senior Wrangler with a University oar is very far from common. A man so constituted as to be able to attain both these distinctions is not likely to have his head turned by the incense of the gaping crowd; but to weaker vessels the foolish

prominence given to the doings of the University crews long before the race is rowed cannot be without its moral dangers, any more than severity of training is without its physical perils to people whose muscular strength is not backed by a perfect constitution. The excitement felt by a man rowing in his college boat who knows as he passes "Grassy" that relations, friends, and strangers are watching the exertions of his companions and himself with interest, may be healthy enough. But the case is very different when, instead of what may be called a private audience, a vast mob is assembled, of which many members derive their interest in the race from the bets which they have depending on its issue. It is not seemly that the greatest interest displayed in the two Universities by the population of London should depend, not upon anything connected with the object for which the Universities were founded, but upon the degradation into a public show of what was originally a perfectly proper and harmless trial of strength and skill. And the matter appears utterly ridiculous when it is reflected that the majority of the people who rush to see the race are absolutely incompetent to appreciate its real interest, and but for the name of the thing might derive just as much pleasure from looking at the tugging match between a number of men and an elephant which was attempted last Saturday at Lillie Bridge. This was intended possibly as a consolation for those people who could not get up in time to see the great event of the day. The elephant, however, seems to have been conscious of the absurdity of his position, and to have refused to make an undignified exhibition of himself. The course of refusing to enter upon a contest is hardly open to the University crews; but by changing the scene of the race something might be done to avoid the evils attendant upon its publicity.

The race itself this year was unusually exciting, and the result may be regarded as satisfactory. While violent partisans of Oxford may console themselves with the thought that but for an accident their University would have won, people on the opposite side are certain that, as a matter of fact, they were not beaten, and may imagine, if they please, that the result was not merely a matter of chance. As a dead heat has never occurred before, it not unnaturally took the judge so much by surprise that he was not prepared at once to give his decision; and the effect of this was that a pleasing uncertainty as to what had really happened prevailed for some time in London. The only people likely to be greatly disappointed by the final decision are the bookmakers, and to them we cannot wish a more deserved fate. It would indeed be an excellent thing if, by a long succession of dead heats, the bookmakers could be wearied of trying to exercise their trade on this event. Such an occurrence, unfortunately, is not eminently probable; and to prevent a number of disreputable characters from making part of a questionable livelihood out of the University boat-race there seems no way but that above suggested of removing the course to quieter waters. It may no doubt be said that, even if the race were rowed in Africa, that would place no check upon the amount of bets that might be made upon it. But practically we fancy that, if there were no convenient occasions for watching and commenting upon the men engaged in it, as if they were racehorses, the betting interest in the event would be much diminished. With more force it might be urged against taking the race away from London that the interest of the majority of the crowd which assembles to witness it is harmless, and that a flock of innocent holiday-makers should not be disappointed because it contains some black sheep. But, as far as we know, the Universities of Cambridge and Oxford were not instituted in order that eighteen young men chosen from each should once a year display their bodily prowess as a source of amusement to a London crowd. In the meanwhile, we are pleased to observe a tendency on the part of the men whom the race really concerns to avoid the disagreeably public character which has lately attached to it. At the dinner after the race this year we learn from one of the papers that representatives of the press were rigidly excluded; a fact which seemed to cause some bitterness to the writer, but at which we most heartily rejoice.

THE BEGINNINGS OF BOHEMIA.

NOTHING tests a man's notions of historical criticism better than to set him at work on a foundation legend. The two such legends to which people seem to cleave most fondly are two of the most impossible. We do not know whether anybody cares to believe in a personal Hellén or a personal Italus, or to hold that the Persians were called from Perseus and the Medes from his son Médos. But we have stood face to face with a man who believed in Brutus the Trojan, and we believe that the sect is not confined to him only. Romulus too has many votaries, who seem to cleave to him more fervently as his legend is more and more shown to be impossible. Scholars have shown over and over again that the tale of Romulus is not only not history, but is not even genuine legend or tradition. But the more the scholar proves this, the more the tourist and the local antiquary cleave to their idol. In the Brutus legend it may be that another element comes in. It is not impossible that Trojan Brutus gets mixed up, at least unconsciously, with one or both of the two Roman deliverers of that name. There is, it must be remembered, a sect which places these deliverers not very far apart from one another. The old Roman republic is thought to have been about as long lived as the Roman republic of

our own day. It passes for a short interval of confusion between two periods of lawful rule, the rule of the Tarquins and the rule of the Cæsar. The Brutus who drove out the last Tarquin and the Brutus who slew the first Cæsar are looked on as, if not the same man, yet as men not very far apart from one another, it may be as father and son. It would really not be a much greater leap to identify the founder of Britain with one or both of the republican heroes, and to hold that he is the embodiment, not only of the name of the land, but of one of the characteristics of its people—that Brutus in short, at once founder and tyrannicide, is the great expression of the doctrine that “Britons never shall be slaves.”

The believers in Romulus and the believers in Brutus have, we may be sure, never stopped to compare the Romulus story or the Brutus story with any of the kindred stories of which the world is full. Are they, for instance, ready to believe in Trebetas the son of Ninus, who wandered out of Assyria and founded the city of Treveri, Trier, or Trèves, the oldest of European cities, some centuries before Romulus planted his hut on the Palatine? The chances are that they have never heard of Trebetas, and that, if they did hear of him, they would at once scorn his story as a monkish fable. Fable it certainly is, whether the invention of monks, of secular priests, or of laymen; but it has exactly as much to say for itself as the stories of Romulus and Brutus. They are all alike made-up stories; they are made-up stories in a different sense from those genealogies which are doubtless just as fabulous, but which were matters of honest inference. “Saxo Grammaticus” begins his story by telling us that Dan and Angul were brothers. That is to say, he, or those whom he copied, saw that Danes and Frisians were kindred nations, and they thought that they must have taken their names from two brothers. The fabulous genealogy then has a certain value; it shows that the manifold kindred between the two nations had struck people. But Saxo has nothing whatever to tell us about Dan and Angul. Of course they were names that we may take for granted; but no acts of theirs are recorded: the detailed legendary stories begin a generation or two later. So Thucydides believed in Hellen and his sons, but he had nothing to say about them. Ion and Doros, like Dan and Angul, were the inferences of men who thought that every people must have been called after the name of a founder. And, though we know most of such names to be fabulous, yet, as historical men, Charles, Lothar, Othman, did give their names to lands and nations; it is possible that the same thing happened in unrecorded ages, and that by some odd chance some name of the kind might really be genuine. We are speaking here of the names of lands and nations, not of those of mere *gentes*; with them the name of the real or imaginary patriarch is of course the rule. In the particular case of Hellen we can see that the name, and therefore the inference, cannot be very early, as it takes a later form of the name. A legend, as opposed to an inference, would have given us some such name as *Helos* or *Sellos*; still the inference was an honest inference; it was an early effort of mistaken criticism, and we have merely the name of Hellen without any legend about him. As the form of the name Hellen proves the name not to be very early, so it is with the name Romulus; no such name could have been borne by a patriarch of the Ramnes. The name, like the story, was clearly derived after some knowledge of Greek and Greek legends had made its way into Latium, and the wolf story, told of endless other founders, was worked into it with a new set of names. So the Brutus story was invented by some one who had read Roman history; otherwise he would never have hit on such a form as Brutus for the *eponymos* of Britain. He who devised the Trebetas story knew in the like sort the legendary history of Assyria. Now in this last case, most likely every one will see this; in the Brutus case most people would see it; in the Romulus case all comparative scholars see it. Still, in the Romulus case there are many who refuse to see it, because the story is old and beautiful, and surrounded with all manner of familiar and attractive associations. But the three stories really stand on exactly the same ground; they are all of them, not mere attempts at ethnical genealogy, like Angul and Hellen, but such attempts tricked out with romantic details according to the greater or less skill of the deviser, who also worked in such knowledge as he had of history or of what with him passed for history. There is really no difference between the story of Romulus in Livy and the story of Trebetas in the *Gesta Treverorum*, except that the story in Livy is the older and more famous and the better told of the two. Livy and the *Gesta* alike grow into trustworthy history as they get on; neither is trustworthy history at the stage where they deal with Romulus and Trebetas.

Let us turn from Rome, Britain, and Trier, to a fourth part of the world. There is a land commonly known as Bohemia, but which our forefathers knew as *Beme*; and of *Beme* came the gentile adjective *Beamish*, which still, like so many other gentile adjectives, exists as an English surname, pointing out that the first who bore it must have come from the land of Beme. Whether the author of *Alice in Wonderland* had any ethnological notions in his head when he talked about a “beamish boy,” we do not presume to guess. The next writer of a small History of England who brings in a blind King of Bohemia without explanation would not do amiss to describe the knights who twined their brides in his, if not as “Beamish boys,” yet, in one use of the word *child*, as “Beamish children.” The earliest inhabitants of the Beamish land, how they came there, and what they did, stand forth in the early pages of Cosmas, Dean of Prag. He begins his story with the Tower of Babel, at the building of which the human race con-

sisted only of seventy-two men, not counting, it would seem, the women and children. Seventy-two languages thus arose, and the families seem to have gone off in seventy-two directions. More modest however than the Trier writer, the Dean of Prag allows that it was not for many ages that Bohemia or any part of Germany—he seems to reckon Bohemia as part of Germany—was colonized. At last however a large body of wanderers came; they were specially pleased with the land which they were to make Beamish. Their sheikh or alderman—*senior* he is called—tells them that they might go further and fare worse, or rather that they could not possibly fare better anywhere else. He had promised to bring them to a goodly land, and he had now brought them to the goodliest of all lands. The land was their own; let them stay there and give it a name. Then says one of the company, “Thou our father art called Boemus; what better name can we give to the land than Boemia?” Boemus, delighted that the land should bear his name, kisses the ground for joy, salutes and blesses it. The land thus became Bohemia and its people Bohemians.

We venture to say that the name of the *eponymos* in this case was more unluckily chosen than any of the others. Cosmas does not seem to have known the real name of his own people. Indeed they were not strictly his own people; still Cosmas, if not of native, was at least of kindred race, as his forefathers seem to have come from Poland. A Byzantine writer, a generation or two later, John Kinnamos, knew the real names of the Slavonic nations, and spoke of Bohemians and Poles as *Τόχοι* and *Αἰόλοι*. In some Polish legends Lech—if that spelling will do—does appear as an *eponymos*; and it showed some lack of identity that Cosmas, or rather the earlier writers from whom he got his stories, did not hit upon Czech as their own patriarch. No more unlucky name than Boemus could have been lighted on. It is worse than Romulus, Brutus, or Trebetas. For one is at least tempted to accept the doctrine that the name which, after a hundred different spellings, has settled down into *Bohemia* and *Bohemian* has something to do with the earlier Boii and their *heim*, *ham*, or *home*. But, without committing ourselves to etymologies which may be dangerous, at all events Boemus was not the native name of the people. It is as if the Hellenic *eponymos* had been, not Hellen, but *Græcus*. Boemus however is his name in the story, and from him Bohemia takes its name. We then get a picture of the earliest Bohemian society. The immediate followers of Boemus were men of wonderful simplicity, mercy, moderation, and sobriety; yet some of their ways seem to have been a true Bohemian in another sense. They did not know the gifts of Ceres or of Bacchus. They lived on acorns and water, or at most on the flesh of wild beasts, to obtain which, and for no other purpose, they used arrows. Fields and woods were common, and they even carried this primitive socialism into other departments which Cosmas describes somewhat more glowingly than might seem becoming in a dean, and within, as Cosmas was, a married dean. He likens them however to monks in this, that no man called anything *meum*, but always *nossum*. At last, like other people, the Boemi began to degenerate. The institution of property arose. There were rich men and poor; men began to do harm to one another; and rulers and judges were needed to settle their differences. At length there arose a certain Græco, who reminds one of the *Διοίκης* of Herodotus. His wisdom and justice were so great that people came to him from all parts to settle their disputes. A town bore his name, Krakow, which must not be confounded with the ancient capital of Poland. He left no son, but he had three daughters of wisdom so great that no son could have surpassed them. One, the eldest, was Kazi, a second Melpomene for her knowledge of herbs and all medicine. The name of the second is written in many ways, but the text of Peitz gives her Teteka. She built a town called Tetka, and misapplied her wisdom by leading the Beamish folk into all kinds of idleness. This is the first mention that we have had of their religious creed. She taught them to worship the Orads, the Dyads, the Hamadryads, and moreover trees and stones and idols of all kinds. But the youngest and wisest of the sisters was called Lubessa, and founded the city of Lubossin. She too was something of a witch, a “*phitonisa*,” = *pythoussa*, and foretold future events. All people came to her for judgment; but at last one man chose to be offended. He did not like the posture in which the lady (“*domina*”) gave judgment. The description is certainly a little odd:—“*Ubi interim, ut est lasciva mollities mulierum quædam non habet quem timeat virum, cubito subnixæ, eæ præterea enixa, alte in pectus stratis molliter accubabat.*” Lubessa, in short, seems to have literally held a bed of justice. She heard and decided the cause; but he against whom it was decided waxed angry. The Beamish folk are the only people in the world who are ruled by women, by women whose hair is long, but whose sense is short. Lubessa agrees. She says that, if they will only choose her a husband, she will marry him and he shall be their lord. The three sisters, the three *Hamenides* as they are called, lay their heads together. They call an assembly of the people, in which Lubessa makes a speech borrowed from the prophet Samuel, and sets forth the evil of having, not indeed a king, for the word *Rex* is avoided, but a duke. If however they will have a duke, she tells them whom to choose. He is an admirable man of the name of Premizl, who ploughs with two oxen, one white before and the other white behind. He shall be their duke and her husband. Messengers are sent, who find the worthy husbandman ploughing with this remarkable pair of oxen. They address him twice

—for, in rustic fashion, he does not hear the first time—in hexameter verse, in the second couplet giving him the title of duke. In this story we cannot help seeing the counterpart of one legend of our own Ine, or rather two legends of him rolled together. Ine is raised to the throne by marriage; he is a husbandman found ploughing at Somerton; Premizl is both. Wonders follow the salutation of the husbandman as duke; among other things, his oxen vanish for ever. He becomes duke and marries Lubossa; they reign together and found Prag as their capital. In their days the Beamish maidens waxed valiant like the Amazons, and built them a town and fortres of their own. The youths presently did the like in their neighbourhood. War follows, then peace, and a banquet at which, after the manner of the first Ramnes and the tribe of Benjamin, every man catches his wife, and so, after the death of Lubossa, the Beamish women became subject to their husbands. Presently comes a barren genealogy of several generations, in which one reign only is dignified with a legend. This dry list of names suddenly lands us among quite well-known people; we find ourselves with Duke Borzevoy—his spellings are various—who is baptized by Methodius, according to our author, though his chronology is not quite exact, in the days of the Emperor Arnulf and of Swatopluk, King of Moravia.

We beg leave to commend this story to the believers in Romulus. It is neither so pretty nor so old nor so famous; being comparatively modern, we can test it better and see whence its parts come: but in point of historic credibility the two are exactly the same. Both are made-up stories, and so differ from real tradition. Real tradition, one scraps of names and customs preserved to us in all manner of odd corners in the Roman writers, help us not a little in making out the early history of "the great group of village communities by the Tiber"; but the mere romance of Romulus goes for no more than the romance of Boemus and Premizl. The wolf-nourished king and the peasant king with his oxen are characters which we meet with all over the world; the one is no more special to Rome than the other is special to Bohemia. The legend of Romulus is simply one among many of the legends of the origin of Rome, which happened to become more famous and to be better told than the others. In the eyes of historical criticism, Romulus, Brutus, Trebetas, and Boemus all pass away as shadows together.

ANOTHER SOUTH KENSINGTON BUBBLE.

IT would seem that, owing to some mysterious agency or influence, the newfangled district of South Kensington still affords tempting ground, for the operations of a certain clique of audacious speculators. It can hardly be supposed that the present financial condition of the institutions with which that aspiring neighbourhood is already identified is such as to encourage further experiments in the same direction. The other day, for instance, there was a doleful Report from Dr. Lyon Playfair, the Chairman of the body which is supposed to be responsible for the Royal Albert Hall. It came out that the corporation has been reduced to the painful necessity of imposing further exactions on the unfortunate seatholders, who had already, under peculiar pressure of an insidious kind, been heavily mulcted in the price of accommodation which most of them did not want, and have seldom found it worth while to take advantage of. It appears that the seat-holders are now liable to be rated at 2*l.* additional for every seat beyond the original fancy price which they paid, in order to provide for the maintenance of the Hall, which otherwise would probably be exposed to the elements. There is, as Dr. Playfair stated, "an arrear of necessary repairs and alterations," and no funds; "if the estimates are now large, it must be remembered that the Hall was very large, and was, as a building, unexampled in any part of the country." Another feature, perhaps, might have been mentioned; and that is, that the speculation is unable to keep its head above water without paying black-mail on regular subscribers, simply because it cannot find a paying audience yielding sufficient receipts to maintain the place in a decent condition. It appears also that Captain Shaw and the Insurance Offices have struck against the dangerously inflammable character of the building. A seatholder at the recent meeting tried to console himself and other victims for the imminent probability of a series of arbitrary demands for still further increased contributions as the position of the Company becomes more desperate, by the reflection that, "when the mismanagement of an institution like the Albert Hall devolved upon a great many people, it generally became unsuccessful." It may be suggested that this is the natural and usual fate of undertakings which are started on empty pretences and with a flourish of imposing names, but which have nothing to offer to the public but what can be procured of better quality and more convenient access elsewhere. It is sad to think that the great temple which was to be the crowning centre of a ring of institutions for the promotion of all the arts and all the sciences should thus be exposed to a sudden collapse; but it is only what was to be expected from its antecedents and management. Then, again, there is the kindred and equally broken-down concern close by—the Horticultural Gardens, as they are called, though they do nothing for horticulture, and are not even gardens in any proper sense. It would indeed be difficult to imagine a more complete picture of ruin and desolation than the enclosure presents at the present time; and the flower and fruit shows which are advertised as such grand affairs consist only of common gardeners' produce in

the way of flowers, and of a few dishes of withered pears and crabby apples apparently borrowed from some stall outside. Yet this decayed and bankrupt speculation was also opened under the brightest expectations and most distinguished patronage as a means of regenerating the human race by uniting, as the programme set forth, "the science and art of gardening to the sister arts of architecture, sculpture, and painting," in the midst of a classical grove. Unfortunately all these fine promises have sunk into the dismal reality of a shabby flirting and playing ground, enlivened by the clash of brass band and refreshment counters, the latter being the chief pecuniary resource of the proprietors.

In the face of these melancholy precedents it certainly seems to require a rare sort of courage for any one to come forward with another project of the kind, under the cover of names which have already been brought in this way into most undesirable associations. Yet we learn from a bundle of circulars which has been forwarded to us that "some years ago Mr. Wills, of South Kensington, conceived the idea of covering the late Prince Consort's National Memorial in Kensington Gardens with glass, and, in connexion with it (*also*), a series of gardens in which to represent the vegetation of each quarter of the globe." It may be admitted that, if this scheme is carried out, it will at least represent the voidancy of the people who waste their money on such an enterprise. As far as the wording of the circulars goes, it would seem that the Memorial is to be covered over, not only with glass, but with gardens; but further on it becomes evident that this is a slip of grammar. What is proposed is to "erect a commodious-glassstructure, in five main divisions, the central division to cover the whole of the Memorial, and the other four divisions to be devoted to the growth of plants, trees, &c."—"&c." it will be observed, opens up a wide vista, which perhaps includes a menagerie and aquarium, if not croquet and a rink—"which inhabit the four quarters of the globe." The "examples of the vegetation of Europe, for instance, are to be arranged in a garden by itself, adjoining the group of sculpture representing the products of that part of the globe, and a similar arrangement is to be made in respect to the remaining groups of statuary." There is also a memorial to the Queen, setting forth that, "if this proposal could be carried out, it would appropriately honour the memory of that great mind whose aim it was to foster the Arts and Sciences, for the benefit, not only of the English nation, but of the whole of the dwellers on the face of the globe." Other reasons why it is thought necessary to carry out this scheme are stated to be that "the magnificent memorial erected to the memory of the great and good Prince Consort by your Majesty's grateful subjects is much too beautiful and costly to be exposed without protection to the injurious influences of the vitiated atmosphere of London," and that "a suitable covering is absolutely necessary, not only to prevent a speedy disfigurement through atmospheric influences of the nation's memorial, but also to enable the admiring thousands who so much appreciate the virtues of the late Prince Consort to enjoy in all weathers an inspection of the beautiful work of art raised to his memory." From another document we learn that the proposed structure is designed to be composed of iron, copper, and glass, and to be octagonal in form, with projections on four alternate faces of the octagon; the diameter is given as 200 feet, the height from the ground to the springing of the dome 145 feet, and the extreme height from the ground to the top of the figure surmounting the lantern on the dome as 340 feet. Clusters of columns forming the piers at the intersecting angles of the octagon are to be carried up in stages to the springing of the dome, terminating in gabled pinnacles and open traceried spires. East and west of the central structure, and connected therewith by corridors, it is proposed to have gardens containing trees and plants "representing the vegetable kingdom of the four quarters of the globe."

This plan, and the reasons given for carrying it out, suggest several remarks. In the first place, the Memorial in its present shape was the result of very careful consideration at the time when it was first taken in hand; and it was expressly intended to be an open-air monument. It must be presumed, therefore, that the question how it would be affected by exposure to the weather would be thoroughly taken into account; and that precautions would be devised in order to prevent any mischief. It would be interesting to know whether the construction of the Memorial has failed in this respect, and there is really any ground for the predicted "speedy disfigurement through atmospheric influences of the nation's memorial." As to the style of the structure, there is no doubt much difference of opinion, as would have equally been the case in whatever way it had been built. The golden figure is, no doubt, a mistake, and there is also great chromatic confusion in the combination of the rainbow tints of the mosaic work, the gilded statue, already a little tarnished, especially on the top of the head, and the white marble groups round the base. On the whole, the Memorial appears to be in a very good state of preservation; and the toning down of some of its more tawdry features is pleasing to good taste. On the other hand, it is on account of its fine proportions and stately elevation that the monument has its chief claim to public admiration; and it is obvious that this aspect of it would be lost if it were to be shut up in an ugly glass case, so that it could only be seen in snatches. As it is, what makes the character of the Memorial is its prominent situation and the way in which it stands out boldly and can be seen from all sides, even at a distance. Another thing is that a conservatory cannot be an ornamental contrivance under any circumstances;

and, as the unhappy experience of the Crystal Palace has proved, it is an extremely troublesome and costly fabric to keep in repair. In an exposed position such as that of Kensington Gardens, a huge, towering glass box 340 feet high would, we should imagine, be very much blown about, and would require continual repairs; and it may be taken as certain that it would be hideously unsightly, and would destroy the whole spirit and effect of the Memorial as it was designed and has hitherto existed. As for the supposed necessity of sheltering visitors from the elements, it can only be meant either as an insult to the English weather, or an assumption that our people are all of a consumptive tendency. We might as well have a glass roof and sides for Richmond Hill. There is another question which must occur to every one, and that is how the funds for this project are to be provided, how it is to be maintained, and who is to have the management of it. The monument has already absorbed an enormous sum, and it is doubtful how far voluntary subscriptions could now be raised to an amount sufficient for the new scheme, while there would also require to be a permanent fund for repairs and attendants. As it is, a policeman is enough to keep order in the open air; but, if there are to be entrances and corridors and separate gardens, the whole condition of things will be changed, and a special staff of attendants will be required. As for the future charge of the structure, it could hardly, being a piece of national property situated in a public park, be placed in private hands; and the sort of way in which Rotten Row and other arrangements in the Park have lately been managed does not encourage much confidence in their capacity to discharge the duty.

On the whole, then, the objections to this proposal would appear to be irresistible. It would spoil a striking monument with which people have become familiarized, and, as far as we know, are, except as to some details, fairly satisfied; and would involve all sorts of difficulties. One of these would be the gardening part of the business, which would hardly be in the way of the ordinary gardening staff, and would perhaps be given to some jobbing contractor, whom it might not be easy to keep in order. Thus there would be a great derangement and additional outlay for no satisfactory purpose. If it is desirable that people should study the vegetation of the world, they can do it very well at Kew or in Regent's Park. There is, however, another reason why we trust that this preposterous scheme will fail—a reason which goes beyond the architectural part of the question, and relates to the manner in which the scheme is put before the public. We have frequently felt bound to express our dislike to the practice of investing in Royalty for private purposes, either commercial or with a view to attain an advertising notoriety. We are sorry to think that the memory of the Prince Consort has already come to be in certain quarters a stock article of trade; and there can be no doubt that the sickening toadyism and barefaced jobbery with which it has been associated has tended rather to impair than to increase the respect with which it is generally cherished. There has already been more than enough of interested or idle adulation, and the memorial which is most likely to raise the Prince's character in general esteem and to confirm his claim to the affectionate remembrance of the country will be found in the account of his life which is now being published at the instance and under the supervision of the highest authority. We must hope, therefore, that this impudent attempt to open up a new avenue for the sort of scandals which have already occurred in connexion with other South Kensington institutions, got up on similar pretexts, will be dropped without delay.

PEW AND PULPIT.

THE City Temple appears to aspire to the position of a kind of Nonconformist cathedral, though certainly, as regards outward form, if it reminds us of a cathedral, it reminds us by contrast only. Its beauty, as has been said of a pug-dog, consists in its ugliness. But its managers are evidently anxious to claim for it the functions of a mother-church, not indeed of a diocese—for are not dioceses a prelate abomination?—but of English Nonconformity generally, and more especially of that peculiarly "apostheal" organization represented by Congregationalism, which Dr. Parker regrets that all Englishmen are not yet sufficiently educated to appreciate. We have already seen that a new experiment in canonization is being tried, though with somewhat indifferent success, at the City Temple. In discussing the relations of the pew and the pulpit its conductors ought to be more at home. For "the ordinance of preaching" is the chief, if not the only, ordinance for which Dissenters usually entertain any very high regard. It was, if we are not mistaken, the special indictment of the early Independents—the body to which Dr. Parker belongs—against the prelates and priests of the English Church that they were "dumb dogs that could not bark"; and their own special claim to supersede the Church was based on their superior, if not unique, capacity for preaching the Gospel. They should be able therefore now, after two centuries' experience, to show more familiarity with the due relations of pew and pulpit, or in other words, with the art of preaching. If "sermons from sticks" are so common an infliction in the Establishment, its more "apostolical" censors should know how to beat the drum ecclesiastic to better purpose. We looked therefore with some curiosity to see what light might be thrown on the subject by these "Conferences," two of which have already been held under Dr. Parker's presidency in the

Temple. It is fair however to say that the attendance was by no means confined to members of his own sect. As he expressed it on the first occasion, "there is no denominationalism in our meeting." And he has further managed on both occasions to secure the services of a distinguished M.P. as representing "the pew" in the discussion. At the first Conference the principal address was delivered by Mr. Cowper Temple, at the second by Mr. Gladstone. For it must be remembered that "the lay element" was here regarded as an essential, if not rather the most essential, element in the proceedings. The professed object of the meetings was "to invite the pew to confer with the pulpit," or in other words to hear what the flock thought of their pastors and preachers. And Dr. Parker accordingly in his opening speech defined the practical aim of the Conference to be to ascertain what the pew expects from the pulpit, and how far its expectations are reasonable and legitimate. One remarkable admission he added, and one very sensible suggestion, which last was echoed by some of the subsequent speakers. His admission was that a preacher who "has not the support of a complete and most impressive liturgical service" is in danger of either striving after unhealthy effects or sinking into monotony, and that hence "the demands made upon Congregational ministers are often quite unreasonable." Whether any direct reference to the Anglican liturgy was intended we cannot say, but at all events the pointed recognition of the high value of a liturgical service, coming from such a quarter, is worth noting. Dr. Parker's suggestion was that "the pew should demand a great variety of preachers" rather than expect to find every diversity of gift and function—expositor, exhorter, evangelist—united in the same man; and he might have illustrated this division of labour, though he did not, from the practice of the Church of Rome.

The appeal to the expectations of the pew was promptly responded to by Mr. Snathies, editor of the *British Workman*, though we do not know that he brought any very important contribution to the inquiry. He considered that the pew had a right to expect from the pulpit "more fire" and "more faithfulness" than it had at present, and insisted, in this last connexion, on the need of constant preaching on the duty of restitution. He also thought "illustrative preaching," after the style of the late Billy Dawson, important. Mr. Deputy Fry was more grandiloquent, but certainly not more practical. His great demand was for "emphatically Bible teaching"; on which it is obvious to remark that there are unfortunately great differences of opinion as to what Bible teaching is, and if our range of view be extended over the whole area of English Nonconformity, with its one hundred and fifty or so of sects, the difference becomes perfectly bewildering. And Mr. Fry did not simplify matters by adding that, inasmuch as the youth of the present day was sceptically disposed, this Bible teaching must be "systematic," which makes it the more impossible to shirk the previous question as to the precise nature of true Bible teaching. Nor does the further admonition that preaching ought to be "suggestive" seem very helpful. There is probably no preacher, good or bad, who is at all in earnest, who is not convinced that his teaching is emphatically Biblical, and there are very few so careless or so dissident as not to hope that it is suggestive.

The great speech of the day, however, was delivered by Mr. Cowper Temple, who modestly began by likening himself to Balaam's ass in the presence of the prophets. He was quite right, we believe, in his opening disclaimer of the not uncommon notion that in these days of a copious and multifarious literature the pulpit has lost its usefulness and its power. Experience certainly serves to show that the sermons of a really earnest and able preacher were never more thronged than now. Mr. Cowper Temple's detailed suggestions were, as might be expected, of a practical and intelligible kind, though we are not sure that some of his remarks on the most effective method of warning a congregation against infidelity may not be open to criticism. "The phenomenon of what is called conversion," treated in a quasi-scientific way, hardly strikes one as particularly suitable for the pulpit. Mr. Temple was on safer ground when he insisted on the importance of preachers holding up to churchgoers "a mirror" wherein they might compare their own daily life and conduct with that of those who do not go to church, and we are afraid he was not far wrong in singling out censoriousness as a fault to which religious people are specially addicted. Still more to the point was his suggestion that preachers should not confine themselves to vague generalities, but condescend to particulars, such as the right employment of money, time, and influence; and the tribute he paid to the plainspoken and very successful teachings of a well-known "rector in Belgravia" was, we believe, fully merited. It is quite true that the "beautiful, elaborate, systematic discourses" which were admired by our grandfathers as alone consistent with the dignity of the pulpit have lost their flavour, and that the preaching which is now really most prized, as well as most beneficial, is that which is direct and instructive, and comes home to the conscience rather than titillates the ear. Not that we can at all profess to agree with Mr. Temple's closing panegyric on Moody's preaching, which was commonplace, monotonous, and unsuggestive—if such a word may be allowed—in an almost unexampled degree. But we fully concur in his approval of the statement which that eccentric evangelist is reported to have made on the first night of his appearance in London, that "there are hundreds of men in this town who can preach better sermons than I can." We greatly doubt if there are many hundreds of men, either "in this town" or out of it, who could preach worse.

At the second Conference the place of honour was occupied by Mr. Gladstone, whose literary and oratorical versatility seems to be almost inexhaustible, and who, as was natural, made an eloquent and interesting address with many practical suggestions. Like Mr. Cowper Temple, he thought that the frequent complaints of ineffective preaching were to be attributed in some measure to the fault of the hearers, who are too apt to lack that "healthy appetite" by which alone the pew can relish the food provided by the pulpit. And as Mr. Temple denied the alleged incompatibility between the preacher's office and the wants of a literary age, Mr. Gladstone contested the cognate notion that the advance of science must put an end to preaching, though he admitted that the alleged antagonism was partly due to "factitious modes of representing Divine truth" on the part of Christian teachers and believers. His main subject however was the proper preparation of the preacher, and here he quoted an observation made to him many years ago by Dr. Dollinger that, if the Church of England was to become truly national, the clergy must abandon the practice of delivering written sermons. Certainly it is curious enough that a custom which prevails, so far as we are aware, in no other communion Catholic or Protestant, and in no country but England, should have become till within comparatively recent years so completely a fixed institution in the English Church. The Evangelicals were the first to innovate on the established usage, and the so-called Ritualists, wiser in this than their early Tractarian progenitors, have not been ashamed to follow so encouraging an example. Mr. Gladstone very justly exposed the popular fallacy of supposing that extempore preaching means unprepared preaching, whereas on the contrary to preach extempore "without knowledge, study, thought, and cultivation," not to speak of higher qualifications, is to court inevitable failure. At the same time all really effective preaching necessarily, and rightly, depends in some degree on the personal peculiarities of the preacher. This point Mr. Gladstone illustrated by reference to the distinctive characteristics of two very remarkable but very diverse preachers whom he had himself formerly heard, Dr. Newman and the late Dr. Chalmers, and a great orator in a different arena, the late Mr. Sheil. A great orator he was generally held to be, though Mr. Gladstone's description of his voice and manner suggests that the *mens divini* must have had more to do with the secret of his eloquence than the *os magna sonaturum*. His "vivid imagination and enormous power of language" had at least to contend with no ordinary physical difficulties. "If you will consider a tin kettle battered about from place to place, producing a succession of sounds as it knocked first against one side and then against the other, that is really one of the nearest approximations I can make to my remembrance of Mr. Sheil's voice." And yet that voice was so completely a part of the man that nobody who heard him would have wished it changed. Mr. Gladstone adds—what preachers and not least preachers of great natural eloquence would do wisely to bear in mind—that with all this wildness of manner and impetuous flow of words, Mr. Sheil very carefully prepared the substance, if not even the form, of his speeches beforehand. One final observation we may subjoin, which seems naturally to arise out of what Mr. Gladstone said, though he is not reported to have expressly drawn the inference himself. Instruction and practice in preaching form, if we are not mistaken, a regular part of the course of ministerial training both in Roman Catholic and Nonconformist colleges. Why should the preparation for what all parties, High and Low, are agreed in regarding as so important, and often so inadequately discharged, a duty of the ministerial office, be left to chance or individual caprice in the Church of England? It is no reply to say that orators cannot be manufactured to order. *Poeta nascitur, non fit*, yet poets owe much to the training, whether external or self-imposed, which has made them severally what they are. Moreover not all preachers, nor indeed most preachers, can under any system or in any Church be great orators. But all who have any genuine vocation for the responsible office they have undertaken, may acquire the power of so preaching as both to interest and to benefit their hearers.

ENGLISHMEN IN THE COLONIES.

WE learn by telegram from Melbourne that a united Australian team has beaten the travelling English Eleven. We may presume that the odds of numbers were in favour of the colonists, and probably the amalgamated winners from the South Australian and Victoria Clubs mustered nineteen or one-and-twenty. All the same, this cricketing incident is a striking proof of the strength of the inborn tastes of Englishmen, who will foster the sports and habits of their country in climates which are apparently the most uncongenial, and amidst surroundings which are almost ludicrously incongruous. Take cricket as an example. Even in England we can only play the game through certain months of the year; but at least through a long so-called summer, beginning in the bleak spring and ending in the chilly autumn, the matches and the practice for them can go briskly forward. The game in its physical conditions and accessories is essentially English. No country in the world can show such turf as this foggy and rainy island at which our French neighbours profess to shudder. Few countries boast richer foliage, and if our oaks and our beeches cannot vie in their proportions with the giant trees of the Californian seaboard, at least they offer as dense a shade for the marking and refreshment tents when the matches are going forward. And the village green is as much an English institution as the game of

cricket itself. We are all familiar with those picturesque semi-sequestered spots which are to the humblest members of our rural democracy all that the neighbouring park with its venerable timber is to the family of the nobleman or wealthy squire. The turf is thick and short and crisp, though the soil may crack and the surface be charred in exceptionally dry seasons. It is all the better for the nibbling of the sheep; and the commoners' geese that enjoy the run of it, although they are always digging with their bills, do it no perceptible harm. A little judicious watering and rolling brings it into very fair condition for bowling. Then of a balmy summer evening the inmates of cottages that may possibly be overcrowded love to loiter in the desultory assemblage and look on at the game. The genial thirst that comes of honest exercise may provoke an occasional visit to the bar of the village public-house, where the sign is creaking in its rusty irons from the pole opposite the door. But there is no temptation to linger in the stuffy bar, and no inducement to drink oneself stupid. The young squire and his brothers, who are fresh from the playing fields at the universities or the public schools, shirk the late dinner at the hall to come down and join in the rustic game; and thus we have an immense cricketing population in the country which contributes its *élite* to the crack Elevens. But when the home-bred Englishman emigrates to Australasia, or when he is ordered away with his regiment to some station in the Mediterranean or elsewhere, he receives new lights as to the physical geography of the world, and awakens to novel conditions of existence. In place of promoting circulation by exercise, it becomes his engrossing object to keep himself cool. Yet he does not take kindly to the siesta of the Southern races, though he finds it hard sometimes to shake off the somnolence that will strive for the mastery at unseasonable hours. If he renounces exercise, he finds himself ageing and stiffening prematurely, or at all events tending to corpulence and an unaccustomed shortness in the wind. So more than ever there comes a craving for the sports to which he has been addicted since the days of his boyhood. Yet, when first he decided to resume his cricket, he found that his troubles were only beginning. Everything must be done duly and in order; and the swift bowling which is perilous enough even at Lord's and the Oval becomes positively terrific on a sun-baked soil. Standing up to swift practice in such critical circumstances is sufficient to overtax the resolution of the pluckiest; and then the remorseless glare of the fiery sun makes the game impossible except late and early. You have to resort to every sort of device of artificial watering; and, in spite of that and the most indefatigable rolling, you find you have been working upon most indomitable matter. The mere physical exertion is indefinitely increased by relaxation in the semi-tropical temperature, and nothing short of irrepressible activity and the most inveterately rooted instinct for sport can encourage you to persevere in the task of acclimatization. Therefore, we repeat, such a victory as has been achieved by the Australian colonists should be eminently gratifying to our national pride; and we hail such a defeat of our English representatives more gladly than an unbroken succession of victories. For it is the spirit that won the Melbourne cricket match which first subjugated British India and held it subsequently against the mutineers. It is this art of making English homes and keeping up English habits wherever men of the English race have settled, that is the best assurance of our holding our own over all the world in times of commotion.

As it is with cricket, so it is with other sports. Turf and a tolerably temperate atmosphere would seem to be as indispensable to racing as to bowling and batting. But as Englishmen will go in for gallops instead of taking their exercise in easy rocking-chairs or being borne in litters, or palanquins, or hammocks, so, wherever they ride, they will race. They cannot run down to Epsom or Ascot in the season, or attend the "Grand Military" or the "Grand National." But they have been spending probably more than they can well afford on horse-flesh, buying Arabs and Barbs or high-mettled half-breds. The conversation that is so apt to flag at the monotonous mess dinner turns naturally on the merits of their respective mounts. Private matches are but an unsatisfactory way of settling the points in dispute, so they constitute themselves stewards, and get up race meetings, in which their civilian countrymen eagerly join, and the Governor or the Commandant of the place is bound to subscribe liberally. At Gibraltar and at Malta, even at Hong Kong and the greater Indian stations, there are local meetings got up every year which absorb the interest of everybody, as they overpower all other excitements. The modern military representatives of the old orders of chivalry may win fame at these gatherings in the eyes of beauty, not to speak of winning money as well, which is generally an object of some importance. And there is an unusual abundance of amateur jockeys who can show a fair hunting seat, picked up in pig-sticking and otherwise. Notwithstanding a generous habit of living, there is little difficulty in training down welter weights in a climate where the difficulty is not to perspire; and the performances on the course under the circumstances are generally highly creditable. We need to grumble at the clouds of dust on the Derby Day, in times when it was the fashion to go down by road. But what was that Surrey dust to the whirlwinds of penetrating powder on an Indian road, when they are put in motion by a line of motley vehicles setting from the cantonments in the direction of the racecourse? The dangers to the riders are a more serious matter. Do what they will to keep the course in order, it is no joke coming a cropper on that hard-baked ground, and he is fortunate who has learned to fall lightly when contusions and broken collar-bones are the natural order of the day. Hunting is made impossible in most of our dependencies by the

absence of foxes, though substitutes are found which materially increase the percentage of danger referred to in the time-honoured saying of Mr. Jorrocks. The man who can artistically handle a stock-whip among herds of wild cattle in headlong career over the break-neck ups and downs of the Australian bush may be trusted to keep his seat almost anywhere. In a rush for first spear among the rocky nullahs of the Indian plains you may be said to carry your life in your hand; and even the riding to hounds, where a parody of fox-hunting can be accomplished, has risks unfamiliar to the pastures of the Shires, or even to the more cramped country in the rest of the British Islands. The Calpe pack has long been famous, and the Duke of Beaufort came to the assistance of a relative in hunting it one season with a draught of the hounds from his kennels at Badminton. There is no lack of foxes in those shaggy Andalusian covers, and there is every chance that they will be in excellent wind. You have to follow them in a most broken country, whose picturesqueness is its principal charm, and, looking about you from a meet near one of the *ventas*, you are reminded rather of the Scotch Highlands or the wilds of Connemara than of the magnificent going in Leicestershire and Northamptonshire. You may meet moreover with adventures that are strictly local in their colouring, and that may be more romantic in their beginning than agreeable in their results. For we have seen one of those famous Spanish bulls which would have made a sensation when launched in the amphitheatre at Ronda take umbrage at the scarlet on the shoulders of the horsemen, and turn the pursuers into the pursued. And there is far more excitement than is pleasant in having to gallop for one's life over a fenceless country, which is nevertheless frightfully cut up with all manner of natural obstructions.

It would be well if Englishmen carried only their sport and their passion for exercise abroad with them when they are settled far to the South or on the other side of the world. Unluckily they are at least equally conservative in some habits which had better be left at home. An Englishman will insist upon living in much the same way all the world over, especially if he believes that his exile is to be a short one. A cricketer or a hunting man who goes in for severe exercise in England may be all the better for heavy dinners and none the worse for a fair quantity of sound liquor. But it is a very different thing when he can seldom keep himself cool except under the play of the punkah, and when the sun to which he so freely exposes himself is making stealthy approaches on his brain or his liver. Most other nations practise increasing temperance as the mercury mounts in the thermometer. Take your passage beyond the Isthmus of Suez in a foreign steamer, and you are served with light meals washed down with lighter claret. But on board the boats of the Peninsular and Oriental Company, which has doubtless no choice but to consult the tastes of its customers, you sit down to such a dinner as you find spread at the *table-d'hôte* of an English hotel, and sherry is one of the beverages most in favour with the guests. So on "the Rock" or at Malta the gentlemen of the garrisons at their most hospitable messes follow up the soup with heady sherry which has not even been toned down by time, and the vintages generally are conspicuous for their body. In the East and West Indies evaporation goes briskly forward; and there is every temptation to a generous use of liquids. The more violently you exert yourself, the more swiftly the drain goes on. Without exactly recommending total abstinence in those latitudes, we are sure it would be infinitely more conducive to comfort, to say nothing of health, if the sufferers had recourse to the innocent beverages so much in favour with the natives, instead of indulging freely in brandy pawnee, or in those strong-brewed Indian pale ales which are admirable drinks in moderation. Still, although we cannot close our eyes to these amiable and not unnatural weaknesses, we may hope that our countrymen in foreign parts can never come to any great harm so long as they cling to these active pursuits which go so far to preserve the British stamina.

THE DISTRESS IN LYONS.

THE distress that prevails in Lyons has aroused a very untold amount of sympathy throughout France, and has called forth that spirit of private initiative and unofficial help which has hitherto been strikingly absent from the country, and whose development can alone give permanence to Republican institutions. It may be interesting to inquire into the causes of the distress which has thus engulfed the second city of France. The nation has enjoyed an extraordinary immunity from the long depression which has weighed on all other commercial countries. It escaped the panics which in 1873 followed one another so rapidly in Austria, Germany, and the United States, and the reaction of which compelled the Bank of England to raise its rate of discount for the time to ten per cent. Since then its foreign trade has gone on extending, and its revenue has exhibited an elasticity that has astonished all observers. In short, it seemed as if, in parting with its milliards, France had purchased exemption from the ills to which the receivers of the indemnity fell a prey. But the distress in Lyons affords one more proof that in these days international interests are too closely interwoven one with another to permit any country to remain isolated either in good or bad fortune. That distress, however, is not simply the tardy result of a state of things which has for some time past prevailed throughout the commercial world. It is this

to a large extent, but it is also partly due to special and local circumstances. Lyons has become the centre of the European silk manufacture. In its immediate neighbourhood it has the raw material of that industry, and it supplements the home supply by a large importation from the East. In fact, Lyons is rapidly taking the place of London as the great emporium of Asiatic silk. And not only the city itself but the surrounding country also, has gradually been converted into a vast manufacturing camp. During the war with Germany, while the whole resources of the nation were strained in defence of the territory, the production fell off. But with the return of peace there was an outburst of enterprise throughout the world, in which the Lyons silk manufacture fully shared. The over-speculation of the two years that followed led to panic and depression elsewhere, but Lyons escaped the crash. In other branches of business Frenchmen had been cautious, for the losses of the war disabled them from entering into the feverish enterprise that did so much mischief in Germany, Austria, and the United States. Moreover, the intervening couple of years, industriously employed, had greatly increased the national wealth. The price of the raw material also was exceptionally low; and, lastly, so long as the speculative fit continued, manufacturers found no difficulty in disposing of their goods. Hence it happened that Lyons escaped the crisis of 1873. Had the manufacturers taken warning at that time, and lessened their production, all would have been well. But, instead of doing so, they continued to work their mills to their full capacity. In the meantime their foreign customers were no longer in a position to buy at the old rates. There was consequently a decrease of over thirteen per cent. in the export of silk in 1874, as compared with 1873; and the export of 1875 showed a further falling off of over nine per cent. Under these circumstances a crisis was inevitable sooner or later. It was precipitated by an accident. In the middle of April last there occurred a frost so severe that it killed a large proportion of the silkworms, and caused a failure of the crop. It is curious that, though this frost was in the middle of April, and although its effects were notorious, it had no influence on prices until the middle of June. The explanation, no doubt, is that the accumulation of stocks in the hands of the French manufacturers and wholesale dealers was so great that they were glad to diminish them at any price. This eagerness to sell mystified English buyers, who came to the conclusion that the reported failure of the crop was a mere trick, and consequently they refused to advance prices. But in June their incredulity gave way. Not only from France, but also from Italy, Spain, and China, came evidence which could not be resisted. Then a panic seized buyers. With a single bound prices went up fifteen per cent., and in the following month the rise reached from twenty-five to thirty per cent. It continued during August and September, and reached its culminating point in October, when the advance for French manufactured goods was more than forty per cent. Of course only a part of this extraordinary rise was justified. It was the work of panic, aggravated by speculators. As the legitimate traders were incredulous when they ought to have been preparing for what was coming, they fell a prey to the hungry profit-seekers who were attracted by the reports of the good things realized. We are told that the same bale of silk often changed hands six or eight times in a single day, with of course a rise of price at each transaction. It may be worth while mentioning here, as an illustration of the unlooked-for ways in which events act and react upon one another, that the same frost which had so great an effect on the silk crop checked the extraordinary fall in silver which was alarming half the Governments of the world. For it caused an unprecedented demand for the silks of China, India, and Japan, to meet which it was necessary to export large quantities of silver to the East, and this exportation raised the price of the metal.

In October the panic passed away as suddenly as it had arisen. English, American, and French buyers had bid against one another in feverish anxiety lest they should be unable to obtain the stocks they required. Speculators had rushed in to disturb the market still further, and then retailers, frightened at the steady upward tendency of prices for months together, joined in the flurry. Manufacturers were elated, and bought up all the raw material they could find at a still greater advance, ranging from eighty to one hundred and fifty per cent. The public, however, was not content to give these prices. As happened a few years ago when coal and iron were made artificially dear, the public refused to buy. We have already seen that for some years the foreign demand had been falling off; but last autumn there were special causes producing a further decline. In the United States the long depression that had lasted since 1873 was aggravated by the disputed Presidential election. In Europe the Czar's Moscow speech and the mobilization of the Russian army awakened a universal apprehension of war that checked all enterprise. To these causes another more inscrutable was added. Fashion suddenly changed its mind, and discarded silk in favour of woollen fabrics. How far this was due to the extravagant prices demanded, and how far to mere caprice and love of change, we leave to others to determine. In any case the result to the manufacturers and workpeople of Lyons was disastrous. Last year the exports of silk showed a decrease of over twenty-one per cent. compared with those of 1875, which, as we have already seen, themselves showed a considerable falling off as compared with previous years. So enormous a decrease in a year during five months of which prices were so inflated, means, of course, that the diminution in quantity was still greater than that in value. But, confining ourselves to

value alone, we find that the exports of last year, compared with those of 1873, showed a falling off of 8,400,000*l.*, or very nearly forty-four per cent. The result was that manufacturers stopped working. In a Report to the Minister of Commerce at the end of February the Chamber of Commerce of Lyons state that half the looms in the city were then completely stopped. The Report adds that manufacturers had endeavoured, to the best of their ability, to lessen the hardship to the workpeople. They diminished first the number of working hours, then the number of days, and, lastly, they stopped a certain number of the looms in the larger factories. Still the result is as we have said. It is further to be borne in mind that this statement applies exclusively to the city, which contains only about 30,000 looms out of 120,000, the estimated number of those of the whole district. In the country round about the cessation of work is not carried to the same extent.

Thus the immediate cause of the disorganization of the staple industry of Lyons and the forced idleness of so large a proportion of its workpeople is the failure of the silk crop last summer, which raised the price of the raw silk to a figure at which production became unprofitable. This, however, would not have plunged the city in distress and compelled half the factories to close, had it not been that in previous years there had been an over-production, stimulated by the low price of raw silk. In the Report already referred to, the Lyons Chamber of Commerce tell us that the prices at the end of 1875 had fallen to the level of 1848. Lastly, these various influences were aggravated by the change of fashion, which preferred woollens to silks. The apprehensions of war on the Continent, the depression prevailing in all commercial countries, and the bankruptcy of so many foreign States, all had their influence. In addition there were other causes peculiar to France. First among these is the damage done by the *phylloxera*. For ten years this disease has been ravaging the fairest portion of France, and in 1876 it was peculiarly malignant. Partly owing to its destructive effects, and partly to the unseasonable weather, which was as little favourable to the vine as to the silk culture, the wine harvest last year was not quite half that of 1875, and fell short of the average of the last ten years more than twenty-three per cent. So signal a failure in the greatest of French industries—an industry which in one shape or other gives employment to seven millions of people—must have incalculably crippled the whole population, and diminished its purchasing power. Even if we assume that the loss was partly made up by enhancement of the price, that would compensate France only to the small extent of the foreign purchases of wine. The quantity exported is trifling compared to the quantity consumed at home. As to this latter there was no national compensation. The wine-growers were poorer than they had been the year before by half their crop, and even if we can suppose that they doubled the price, then the consumers of wine at home were poorer by the enhancement of price, and consequently had less to lay out on silk or anything else. Of course, the real fact is that the loss was shared both by growers and consumers. These remarks in reference to wine apply equally to the case of sugar. Some time ago we laid before our readers an account of the great failure in the beetroot crop last year. That failure also diminished the purchasing power of the population, and consequently lessened the demand for silk. Thus the past year has been in every point of view one of trial and adversity for France, the three industries in which she enjoys unquestioned European pre-eminence having been all simultaneously visited with disaster. The fact brings home to us in a very striking way how dependent we still are upon the elements, with all our boasted civilization and command over the forces of nature. A single night's frost plunges a great city into destitution and suffering. Too much rain blights a crop which was giving France the command of the European sugar markets; and a little insect, aided by bad weather, threatens with destruction an industry upon which more than any other depends the prosperity of the wealthiest country on the Continent of Europe.

THE STATE OF GOVERNMENT OFFICES.

WHEN it was first made known that the inmates of the War Office were suffering in health and exposed to serious danger from the bad sanitary arrangements of the building, the Under-Secretary of State for War took upon himself to dispose of the complaint in a very summary manner. He wrote a letter to the newspapers flatly contradicting the allegations which had been made as "devoid of fact"; and asserted that the War Office had been "carefully examined, and the drains put in order, by the Board of Works," and that there were no cases of sickness. The *Sanitary Record* at once exposed this fiction by a detailed description of the actual state of the buildings; and the truth of what was stated has now been decisively confirmed by the Report of an authoritative and impartial Commission appointed by the Government, which is, in fact, substantially a repetition of the article in the *Sanitary Record*.

The Commissioners carefully examined the whole of the War Office buildings, and found various sources of impure air, including closets in the area within a few feet of doors leading into rooms residentially occupied and into the passages; a laundry, from which vapour is disseminated to some distance; a capstan; kitchens; rooms occupied by families both for living and sleeping; and a printing establishment, which,

as well as the passages, is lighted by gas, often during the whole day. They also report that "the passages of the basement are narrow, dark, and tortuous, with scarcely any means of ventilation except from the areas, in which there are closets"; that on the floors above there are closets close to the rooms of the clerks, who complain of the odour; that noxious gases from time to time escape from the pipes of several lavatories, and that the lavatory accommodation is altogether defective, the overflow pipes opening into the soil pipes. The general neglect of sanitary rules is carried even so far that water is habitually drawn for consumption from the taps of several of these cisterns. Further, it is added that "there is no possibility in the majority of rooms of obtaining any movement of the air." "In the most lofty rooms the windows are so far below the level of the ceilings that a chamber of air, foul and stationary, remains without the possibility at present of clearing it; there is hardly a room with any cross ventilation in it"; and in some cases, where there were ventilators, they were "found to be papered up by the occupants of the rooms, in order to obviate a draught, which would necessarily cause illness." The rooms, on the whole, are large enough for the inmates, but "the ventilation is most defective." The inevitable consequence of this noisome atmosphere may easily be foreseen; and the Commissioners state that, "though they had no evidence of special outbreaks of disease having originated from the sanitary defects described, they have no doubt that a daily exposure for several hours to their influence must tend to deteriorate the general health of persons so exposed"; and that certain suggestions which they make would, if carried out, only mitigate evils, not remove them, for it is impossible to remove the inherent defects of the buildings "so as to permit of the retention of the present War Office."

Now this raises some very serious questions. It may be assumed that the Under-Secretary who was so hasty as to assert without inquiry that the reports of the foul condition of the War Office were "devoid of fact" will take care in future not to impute misrepresentation to those who bring well-founded charges of neglect and mismanagement on the part of the authorities. In any case, the fact that a Government office could have been allowed, not only to fall into, but to remain in, such a shocking condition as is described by the Commissioners demands the attention of Parliament. If it is true that, under the circumstances now detailed, the Board of Works really did, as the Under-Secretary asserted, pretend to "carefully examine the buildings and put the drains in order," the Board of Works ought certainly to be called to account. Moreover, it ought immediately to be ascertained how far the state of other Government offices approximates to the one which has just been exposed. The accommodation at Whitehall is known to be quite as bad as that in Pall Mall; and it is suggested by the *Sanitary Record* that there is reason for suspecting that similar defects may be found even in the new Foreign Office. Further there are great complaints of the sanitary condition of the Admiralty; and the journal above-mentioned states that Deputy Inspector-General Mackay, a very valuable officer, has just died from typhoid fever, due to his being, thanks to the Board of Works, supplied with poisonous drinking-water, drawn from a cistern which also supplied the closets, and the waste-pipes from which communicated directly with the sewers. It is also stated by the *Civil Service Review* that one of the members of the staff of the Audit Office, Somerset House, is laid up with typhoid fever, contracted in the discharge of his official duties; that others have been or are suffering from ulcerated sore throats; and strong representations have been made regarding the drainage of a portion of the building in which the department is located.

As the gross neglect and incapacity of the officials of the Board of Works have thus been brought to light in more than one instance, it is clearly necessary that there should be a general inquiry into the manner in which the Board discharges its duties. A paper by Mr. Taylor of this department is appended to the Report, in which an instructive illustration is given of the success with which it has mastered the art of how not to do it. He states that his reasons for supposing that there are no cesspools under the War Office "are that it was the rule with his predecessor to abolish all cesspools which were known to exist"; and that he had himself strictly adhered to this rule, and had from time to time "given instructions to the Clerk of the Works to cause careful search to be made wherever there was reason to believe that cesspools might have been left." Mr. Taylor does not say whether these instructions were ever carried out, but he remarks that, "unless the whole of the basement-floor be uncovered and excavated to a depth of some feet," he "cannot undertake to say positively that there are no cesspools under the building." Thus, the Board of Works appears to have conducted its "careful search" so as to take good care not to find the cesspools.

REVIEWS.

PARKER'S MOSAIC PICTURES OF ROME.*

MR. PARKER'S volumes or Parts—this is called Part XI. at the end, yet we do not think that there have been eleven volumes—come upon us almost faster than we can grapple with

* *Medieval Church and Altar Decorations in Rome, and Mosaic Pictures in Chronological Order.* By John Henry Parker, C.B. Oxford: James Parker & Co. London: Murray. 1876.

them. This time he has taken a great leap. The last volume dealt with the Aqueducts; the one before that with the Colosseum. Now we are carried into quite another state of things, and find ourselves among the early churches. Yet it is hardly among the fabrics themselves of the basilicas that we find ourselves, but among their decorations. These take in both the mosaics strictly so called and those other forms of ornament which, without being strictly mosaic, belong to the same general class of workmanship—such, for instance, as what is commonly known as Cosmati work. But we confess to being surprised that Mr. Parker, in dealing with the decorations of the churches, hardly deals at all with the churches themselves. It has struck us throughout his series of Roman books as somewhat strange that one who was best known in England and France as a strictly architectural inquirer should, as soon as he got to Rome, have seemed to throw up the study of architecture proper altogether. There is no one place where so much may be learned of architectural progress up to a certain point as in Rome. We say that there is no one place, for particular points may be better illustrated elsewhere, as at Ravenna or at Spalato; but there certainly is no one place where we can so well study the stages by which the construction of the entablature passed into the construction of the arch as we can at Rome. It is of course only this particular process which the Roman buildings do illustrate. If we want the highest form of the construction of the entablature, we must go elsewhere, to Greece, Sicily, or Southern Italy. If we want the highest forms of the construction of the arch, we must go to Northern Italy and to lands more northern still. But the relations of the two constructions to one another, the way in which the two sometimes went on side by side, sometimes were mixed together or modified one another, till in the end a consistent round-arched style came out, can as a whole be nowhere studied so well as at Rome. Then too there is a wonderful series of capitals, not merely those which conform to pedantic rules, but the bolder inventions which lie uncared for in the baths of Caracalla, or are stored up with a little more of care in the Tabularium. Here, one would have thought, was exactly the subject for Mr. Parker to have illustrated with the minutest detail. He has written a great deal about the transition from the round arch to the pointed. One would have thought he would have been delighted to find a companion subject in the transition from the entablature to the round arch. But in all his Roman inquiries he seems to put strictly architectural forms out of sight. He turns from the capitals to measure the bricks, he turns from the basilicas to trace out the line of the aqueducts. Even the temples he hardly treats of as buildings, but rather as mere features in the topography. We had certainly hoped that Mr. Parker meant, at some stage of his inquiries, thoroughly to deal with these matters, all the more so as they are matters with which he is so much more competent to deal than with many of the matters which he has undertaken. It needs observation, which he has in abundance, while it does not call for much scholarship, in which he is less strong. A man might trace out the growth of the architectural forms at Rome with perfect insight, even though he still cherished a belief in real twins suckled by a real wolf. It would need some attention to dates, but it would call for very little construing, and therefore for very little false construing, of Latin sentences. We were therefore disappointed to find from the advertisement to the present volume that Mr. Parker throws up his architectural inquiries altogether.

This Chapter or Part of my work has been many years in preparation, and a considerable portion of it has long been in type, but it has been kept back with the intention of giving some account of the architectural history of the churches themselves in each of the *Regiones* in which they are situated. But that portion of my work is necessarily mixed up with other subjects, and is so much affected by the enormous excavations that have been going on in Rome, that I despair of seeing it completed; while the architecture of the mediæval churches in Rome is so contemptible when compared with the churches of the same period in the West of Europe, that an account of it is not worth publishing separately.

We really do not understand this. What have the excavations to do with the architecture of the churches or other buildings? The excavations may bring unknown buildings to light, but how can they affect our knowledge of those buildings which stand above ground, and whose architectural history is thoroughly well known? No building at Rome, no building anywhere, is more instructive architecturally than the Laurentian basilica. What can excavations have to do with it? Then what does Mr. Parker mean by the architecture of the mediæval churches in Rome being "so contemptible"? One is tempted to ask for a definition of "mediæval" and a definition of "contemptible." Of what we should understand by mediæval architecture there is very little in Rome either in churches or in other buildings. There is hardly any fully developed Romanesque, except the campaniles, and surely Mr. Parker does not despise them; the basilicas are surely neither mediæval nor contemptible. The work of Renaissance Popes is doubtless contemptible enough, but it is not mediæval. The only strictly mediæval church in all Rome, almost the only mediæval building of any importance, is the church of Santa Maria sopra Minerva. And this is just as much or just as little contemptible as any other church of considerable size built in the pseudo-Gothic of Italy. We really are disappointed. Mr. Parker might so easily have given us a strictly architectural series of buildings, heathen and Christian, showing all the stages of the great struggle between the entablature and the arch. A series of his favourite photographs of strictly architectural forms, capitals, and the like—illustrating, for instance, the various ways,

ingenious and awkward, in which old capitals were made to do duty again—would have been really worth having, and it need not have involved the misinterpretation of a single Latin writer. Instead of this, Mr. Parker in the present volume deals, not with buildings themselves, but with ornaments of buildings. The mosaics of Santa Constantia are discussed, and so incidentally is the date and history of the building. But not a word about the coupled columns, the parents of endless buildings, Romanesque and Saracenic, reaching up to Hugh of Puiset's Galilee. The mosaics of St. Praxedis are fully described, and the singular Ionic capitals are shown in the photographs; but there is no comment on the capitals themselves, though they form part of a long series reaching on into our own Norman and later. These very capitals at Rome must be nearly of the same date as the other attempts at Ionic in the lower story of the round church at Fulda. Of all these things we hear nothing; the buildings themselves are only mentioned incidentally as frames in which to set the mosaics and Cosmati works.

The volume is made up of several detached treatises which are not all Mr. Parker's own. He seems to deal himself with the general subjects of mosaics and church and altar decorations, in which he goes minutely through all the remains of this kind to be found in Rome. Then come three essays by Monsignor N. Barbier de Montault, Chamberlain to his Holiness Pius the Ninth. The first of these is the only strictly architectural part of the book. Here Mgr. de Montault gives a list of the pagan buildings of which parts remain in the churches of Rome, from the Pantheon in all its perfection to the columns built up in Santa Maria in Cosmedin and San Niccolò in Carcere. But Mgr. de Montault does not, any more than Mr. Parker himself, apply his facts in any way to illustrate the history of architecture. For instance, he has to record that in 1503 Michael Angelo converted one of the great halls of Thermæ of Diocletian into a church, that known as Santa Maria degl' Angeli. He says with perfect truth that "his skill in doing so has been too much vaunted by his admirers. It is a magnificent hall; but he did not build it, and the modifications he made were not improvements." But surely there is something more than this; surely there is some kind of evidence that this hall of Diocletian at Rome was really the fellow of the court of Spalato, that Diocletian's great invention came in here also, and that, if Michael Angelo had only left it alone, Rome would have had her own series complete without having to cross the Adriatic to fill up the greatest gap of all. The next essay of Mgr. de Montault is a list of signatures of artists ranging from the fourth century to the sixteenth, a solid piece of Roman archaeology taken for the most part from inscriptions in the buildings. More interesting still is the essay on the artistic works of the Cosmati, or family of Cosmo or Cosmas. Calling them Cosmati is like calling the first Parisian dukes and kings Capets; for of the four generations of the same family whose works are spread over the thirteenth century, the name Cosmas is not found until the third. Mgr. de Montault, by explaining that the Cosmati are "not the inhabitants of the lake of Como or of the town of Como," reveals the strange fact that there must have been people who thought they were. This family produced a series of works of a special kind, sculpture ornamented with mosaics, in screens, ambones, chairs, candlesticks, and ecclesiastical decorations of various kinds. Very pretty indeed they are, not exactly like anything either before or after them, and we are glad to have this clear account of the works and their authors. Mgr. de Montault's work is good solid work of its kind, with nothing that we can see, to raise the slightest scent of theological controversy. We cannot conceive why Mr. Parker should have twice put in an odd kind of protest or apology about delicacy, or something of the kind, between "a Roman Catholic prelate and an Anglo-Catholic layman." Why on earth should not "a Roman Catholic prelate and an Anglo-Catholic layman," or any other two people of any two persuasions on earth, work together about plain facts and dates? Then comes an Appendix on mosaic pictures at Ravenna, seemingly by Mr. Parker himself, followed by another Appendix on fresco-painting in the Catacombs, by Mr. R. St. John Tyrwhitt; and next suddenly comes in a really living thing indeed, an essay on the Catacombs from no less a hand than that of Mommsen, whose name, it is something to learn, "stands deservedly high." Then comes the usual collection of references to photographs not in the book, though this time they are concerned with subjects in the book. Lastly, we have the photographs illustrating the book itself. Photographs hardly do to illustrate mosaics; they cannot give the effect of the colouring, and they do not show the mere lines of the figure so well as an accurate drawing. The effect is, and cannot help being, lazy and smudgy. The Cosmati work comes out much better, but even here the minute ornaments lose a good deal of their delicacy.

The present volume of Mr. Parker's series, though it is in some sort made up of detached scraps, consists mainly of simple, straightforward work. There are no wild and impossible theories, as in the Colosseum volume and some others. A little pains, a reference to some one who can construe Latin and who knows the most obvious facts of history, might easily have saved Mr. Parker from the wonderful mistakes which disfigure this volume as well as the others. In this case they might be got rid of; it is not like the Colosseum volume, where the whole theory is built upon false construing. One of the strangest of the Colosseum blunders turns up again here. Mr. Parker still does not know what the *scena* of a theatre means. It will be remembered that one of the pillars of the Colosseum theory was a mistranslation of a passage of Pliny,

describing the theatre of Scaurus and its richly adorned *scena*. In another place Pliny refers incidentally to the description which he had given of this *scena*. He describes the works of Agrippa in his baths, his pavement and the like, and says that he would have made roofs of glass—that is, of mosaic—if in his time such roofs had been in use—if, as he puts it, mosaic had made its way from the walls of the *scena* of Scaurus to roofs. “Non dubie vitreas facturus cameras, si prius inventum id fuisset, aut a parietibus scene, ut diximus, Scauri, pervenisset in cameras.” This Mr. Parker translates—“No doubt he would have made glass chambers if they had been then invented; or scenes on the partitions, as say of Scaurus, he would have made in the chambers.” What meaning Mr. Parker may attach to this gibberish it is not for us to guess. The important point is that Mr. Parker still does not know the meaning of the word *scena*; and till he learns it—it may be easily learned at Orange—he will not find out the grotesque absurdity of his theory of the Flavian Amphitheatre.

In the very first page we hear of “the Empress Augusta, wife of Justinian,” who is strangely carried to Rome to accompany “Antonina Patricia.” If there were a Latin Chronicle of Queen Anne’s reign translated by Mr. Parker we might hear of the dealings between Queen Regina and Sarah Ducissa. Later in the book Theodora finds her own name; but the whole course of history is turned upside down to bring in an “Emperor Theodoric,” and we hear of “the Greek soldiers of Belisarius,” who were a great deal more likely to be Huns than Greeks. This last fashion, confusing as it was, may plead the example of (Gregorovius; but why follow an “exemplum vitis imitabile”? These things might so easily be avoided. Surely Mr. Parker must have friends at Oxford, if not at Rome, who could tell him the meaning of “*scena*,” “camera,” and “Augusta.”

DRAWINGS BY THE ITALIAN MASTERS.*

MR. CARR, in giving to the public this handsome volume of autotype reproductions of various drawings in the British Museum, illustrated by his own critical notes, has done a work which will be highly appreciated by all who care for art for the sake of their own pleasure, and even more perhaps by those who are interested in its influence as a means of education. In the author’s modest preface he says, “The drawings by the great masters afford the most precious evidence of certain qualities of invention and style. Of the painter’s mastery it is of course only possible to speak from the witness of his work in colour; but of the intellectual purpose that underlies the painter’s craft, and gives life and animation to its forms, the simplest sketch can often be made to tell as much as the most finished picture.” We would go further even than this, and say that for educational purposes drawings may be yet more valuable than pictures by the old masters. Of course no drawing can compete in worth with a really fine picture from the same hand; but there are many elements of uncertainty attaching to paintings that are not found, or at any rate are found in a much less degree, in drawings. The materials employed in oil-painting are far more open to the attacks of time than those relied on in drawing. The chance use of an unhappy medium or pigment, the almost inevitable darkening of the shadows and thickening of the varnish—to say nothing of the most fruitful source of ill, the ravages of restorers—all these things combine to increase the difficulties of a student who would get at the meaning and method of an old master through his works in oil or distemper. To these difficulties must be added that caused by the number of copies and forgeries in existence of almost every well-known picture of the greater masters. In the case of drawings these difficulties, if not entirely removed, are at least immensely reduced. These things being so, it seems singularly absurd that while the unsurpassed, if not unrivalled, treasures of the National Gallery are thrown open in the easiest possible way to the public, every impediment should be offered to those who desire better acquaintance with our national collection of drawings. As far as public exhibition of painting goes, London does not compare unfavourably with any Continental city. As far as drawings are concerned it is at an enormous disadvantage. The fine collection of drawings in the Louvre is as open to public inspection as the picture galleries, and is almost as popular. And, to take only one other instance, in the passage connecting the two magnificent galleries of the Pitti and the Uffizi at Florence, the whole of the enormous collection of drawings is displayed in regular rotation and almost insists upon the attention of the most heedless sightseer. What have we in London to compare to this? A wretched room to which admittance can only be gained by special permission, and in which some of the finest drawings of the old masters are stowed away in portfolios, opened only on the application of the few visitors who have time to devote to the troublesome process of going there. Fortunately, here photography comes to our aid. The process which can give at best but a faint shadow of a painting is able to reproduce a drawing with almost perfect exactness. Mr. Carr has availed himself of this consoling fact to make it possible for people who either cannot or will not encounter the terrors of the print-room in the British Museum to learn something of the drawings which, on account no doubt of their extreme value, are there carefully hidden from the

public gaze. What the writer himself says in the preface already quoted is eminently true—that these treasures “still await a fitting opportunity of display, and the public is not to blame if in the meantime it remains ignorant of the wealth that has been accumulated in its name.” We must hope with him that his publication may “help to hasten the day when a splendid and in some respects unrivalled collection should be made really accessible to the students of art.”

Mr. Carr begins his interesting studies with Mantegna, of whom he says with justice that what he borrowed from those who had gone before proved as nothing compared to what he left for his successors. This painter was the first who made a serious attempt to engraft the bodily beauty of antiquity on the mediæval striving for passion alone regardless of the loveliness of form. To our eyes of course the ideal of Mantegna is very different from that of the Greeks, from whom nevertheless he drew his inspiration. To quote Mr. Carr, his own command over nature had carried him to the point at which he could grasp the full significance of the principles of Greek art, and his work remains to prove that he foresaw, if he did not entirely complete, the union towards which art was tending. The illustrations which Mr. Carr has chosen are that of Mars, Diana, and Venus, and the allegorical drawing of Calumny, taken by the artist from a description in Lucian of a painting by Apelles. The examples are well chosen, as exhibiting the artist’s combination of the grace which he took from the antique and his original grasp of character still struggling with the stiffness and poverty of the school that preceded him. This was the beginning of the movement which culminated in Raffaele’s later style, where is found a dramatic power that Mantegna never possessed, joined to a grace and exuberance of form which the earlier painter was the first to attempt. This very subject of the Calumny was treated in a drawing by Raffaele; and Mr. Carr has some interesting observations on the difference between this and Mantegna’s rendering, which he thinks it probable suggested Raffaele’s. In the later painter’s work he finds less grasp of character, but more command of natural gesture and telling effect. In the work of Perugino, who comes next in Mr. Carr’s list, there is rather a return to the earlier ideas of art. There is much grace, but it is not derived from a Greek source, and there is with it a certain thinness of form and an absence of character. The art of Perugino remained always the same in intention and type; that of his pupil Raffaele broke into a new line:—

At first the divergence between the two seems slight and unimportant, and a perfect work of Perugino, like that of the Virgin adoring the infant Christ in the National Gallery, may without improbability be claimed as an early performance of Raffaele. The younger painter broke so gracefully with earlier traditions that there is no suggestion of antagonism, and yet the separation is in its way as complete and absolute as can be imagined. It is the distinction between Christian and Pagan art, between the service of religion and the worship of nature. For although we must not look in the faces of Perugino for the entire devotion which Angelico bestowed, his work is nevertheless controlled by the same intent. Perugino is still in the rank of those painters who loved only to study a single phase of human emotion. The world of their art is inhabited by a race of beings whose eyes are fixed on heaven. There is grace, but it has but one motive, and passion with but only one aim. The upturned face has only room for a divine rapture, and in the true expression of this one feeling the simple features are wholly absorbed. Human character, and the rich results of human experience which the face and form may be made to tell, are neglected in the realization of human aspiration. This fills the countenance and drives out all record of mere earthly emotion. At first sight Raffaele’s ideal seems to include even less of reality. The gaze of graceful religious enthusiasm is abandoned, but no strong human passion is set in its place. The faces of his women are still untroubled by human experience; the delicate smile upon their lips is even less intense than the imploring gesture that Perugino could command. But it was Raffaele’s gift to be able to discover the way to make his art of wide significance without touching the problems of character or passion.

The first drawing of Perugino’s which the writer has selected, a study for an angel’s figure, is an excellent type of the grace of religious enthusiasm upon which he dwells. In the second, an old man’s head, the draughtsman has been forced in copying nature to escape from the conventionalism and regulated sentiment that marks his ideal efforts. The first specimen given of Raffaele, a Virgin and Child, seems to belong to the period when the artist had thrown off, to a great extent, the influence of Perugino, but had not arrived at abandoning the extreme delicacy and refinement of his early work for the stronger but coarser types which mark his later performances. In the second specimen, the Entombment, Perugino’s influence is more easily discerned; and it is noteworthy that the figure of Christ is very similar to one in a picture of Perugino’s at Florence. In discussing Raffaele’s art Mr. Carr observes that, to understand the source of his influence, we must remember that he laboured neither in the service of things religious nor of things profane:—

He abandoned the saintly grace of Perugino, but he did not truly accept the profounder and more tragic ideal that Michael Angelo perfected. . . . Not to penetrate the secrets of life until the face and form should become the index of strong yearning and sad experience, but to rescue the body for the sake of its own natural beauty, and to reflect in the countenance only the simplest and most spontaneous emotion, was the task that he set himself to accomplish.

In order to mark the contrast between Raffaele and Perugino we have passed over Francia, who might perhaps be described as Perugino with less sentiment and more realism, and who is well represented in Mr. Carr’s work by a fine head of a saint. From Raffaele we pass to Lionardo da Vinci, whose immense power of penetration into character is exhibited in two phases by two studies of heads instinct with noble thought, and by one of

* Drawings by the Italian Masters. Reproduced by the Autotype Process from the Originals in the Collection at the British Museum. With Critical Notes, by J. Comyns Carr. London: Chatto & Windus. 1877.

the grotesque studies in which the draughtsman's complete command of his art is no less evident than in more serious subjects. "No artist," says Mr. Carr of Leonardo, "has ever in the same manner united the lightest with the profoundest truths of expression." While he caught with wonderful truth the momentary impress of rapidly shifting emotion, yet beneath this he showed the whole character and meaning of the face over which that emotion passed, so that, "as we gaze, we seem by some magic power to be admitted to all the mysteries of individual character." What Leonardo did for the face, the writer goes on to say, Michael Angelo effected for the entire human form. "The first and perhaps the most lasting expression that is given by his design is of a new and overpowering vitality." The grandeur of beauty, the calm majesty of power, cannot fail to be recognized as we look at any of his works; but what immediately compels the attention is the "matchless force of life and movement," and, we may add, the intense originality of type and conception. There is but one example given of Michael Angelo, while there are two of Titian, which are chiefly interesting as illustrating the bent of the painter's studies. The drawing for the picture of Peter Martyr brings out strongly the search for effectiveness and the tendency to portraiture which mark the Venetian school, and were in great measure the secret of its success. Mr. Carr has in a terse sentence indicated with rare keenness the end and scope of Titian's work. "What a painter like Titian attempts is always in some sort accomplished; for, with his mastery of hand and distinct limitation of purpose, there is no room for failure." The "Landscape with Figures" is clearly an actual study from nature, and gives evidence of the new spirit which led Titian to catch the changing moods of nature, and thus impress a landscape with romantic interest derived from the prevailing sentiment of the scene rather than the mere elegance of form or brightness of colour. Of Veronese, who may be called the founder of decorative art, we have as a specimen a drawing of the Virgin and Child with St. Joseph, which is more a study of effect in light and shade than anything else. Of Veronese's grand canvases the writer truly says that beneath their theatrical splendour lies a genuine reality. They do not "rightly interpret the dramatic force of the chosen historical scene, but they do contain a faithful picture of a magnificent social life." From Veronese we come to Andrea del Sarto—called "the faultless painter"—the very faultlessness of whose work involves a certain element of dulness. The technical perfection is only secured by being exercised on subjects that require no very lofty treatment, and the skilful imitation of trivial aspects of nature passed "from the art of Italy, as represented by Andrea del Sarto, to the art of France, and may be said to have culminated in the dwindled, but still effective, work of Greuze."

Mr. Carr's valuable work ends with studies of Giulio Romano, Garofalo, and Jacopo Ligozzi—subjects far less interesting than those on which we have spoken, to which he has nevertheless brought all the resources of a keen critical faculty and a power of conveying his meaning with a clearness which all art critics do not possess. He gives more praise than we should be inclined to give to Giulio Romano, who, it is somewhat surprising to remember, was in Shakespeare's time the type of a great artist. Mr. Carr's book is, as far as its immediate object goes, completely successful, and we must again hope with him that it may have some further effect in opening the practically sealed treasure-house whence he has taken his examples.

THE OLD SHEKARRY.*

IT was quite right that these contributions to sporting literature should be collected and published, though one or two points lack explanation, and the editor's duty has not been very well performed. There is a want of sequence in the chapters, Abyssinia coming in oddly between Southern Africa and the American prairies; the chronology is vague and confused; and we are not told how many of the papers are published for the first time and how many are new, though it is quite clear that many are old acquaintances. But every chapter is full of incident. Indeed, the trophies of such a *grand chasseur* represent an immense deal of physical endurance, some very narrow escapes, and one or two awkward encounters in which brute force gained a temporary success over human sagacity and arms of precision. Nor, though Major Leveson's career was obviously cut short by a wound received in the defence of Lagos, can we doubt that his constitution was generally overstrained by hard work and exposure to every kind of climate that can be experienced between the Rocky Mountains and the Doon or the Wynaad. From a brief notice of the author by a gentleman who only gives us his initials, we take the following particulars of Major Leveson's career. He went out to Madras as a cadet at the age of seventeen, somewhere about the year 1845, and was stationed for some time at Hyderabad, in the Deccan, though whether he was ever attached to the Nizam's Contingent Force we are not told. Here he slew tigers and speared wild hog, and, being at home in 1854, on furlough apparently, he went through the whole of the Crimean War. At its termination he spent four years in sporting expeditions, volunteered to serve under Garibaldi in the Italian Revolution of 1860, and in 1863—how or why we are left to guess—was appointed Colonial Secre-

tary to the British Settlement of Lagos, on the Guinea Coast. We suspect the correct official designation should be Administrator, and not Secretary. Here he distinguished himself by raising, drilling, and disciplining a levy of native Houssas, and, by their aid, drove off and defeated a body of enemies who had attacked our territories. But he unluckily was hit in the jaw by a bullet, which the most skilful surgeons of the day could not extract. This compelled his retirement, and he seems never again to have enjoyed complete health. He managed, however, to take part in Lord Napier's Abyssinian expedition, and he even volunteered to go in search of Livingstone. But he could not get over the wound received at Lagos; and at the age of forty-seven, in the autumn of 1875, he died, leaving behind him a reputation as a dashing soldier and a thorough sportsman, which, as claimed for him by the editor, no man is likely to dispute.

We think that Major Leveson, had he lived, would have retrenched and pruned these papers, and we can hardly believe that he could ever have been consulted about several of the illustrations. The trophies of slain animals have probably been photographed, and here we can rely on accuracy; for, as Macaulay said in a celebrated passage about literature, with the dead there is no rivalry, and in the dead there is no change. But there is a large opening for criticism in the pictures of living animals. Some of the deer are represented in exaggerated, and others in unlikely, attitudes, and others again are obviously the mere creations of fancy. A buffalo almost always charges with his head down, and not up. No deer would await the attack of a dog in the absurd attitude depicted in page 329, Vol. I. The capercaillie on page 32 of Vol. I. is a moderate-sized bird, while the black-cock in the page immediately preceding is rather more than twice as big as the cock of the woods. The specimens of wild boars have curly, instead of stiff tails, though this is not the first time that we have known this glaring error perpetrated by artists who never could have seen the *Marsus aper* or any other kind driven out of a cover or brought to bay at the end of a mile; but the climax of absurdity is reached at page 95, where a boar is depicted with tusks and a putty head, *quite portentum* neither the Deccan ever concealed in its rocks nor Bengal in its jungles of *mull* and *kugla*. Seriously speaking, some of the illustrations are hardly fit for a Christmas present to the nursery; and a good many are sensational, such as a duel between two tigers, a lion attacked by a pack of dogs, and sundry elephants of gigantic and amazing stature.

We have so recently noticed the works of Captain Baldwin and Captain Kinloch on Indian sport as it is to be had in the plains and in the Himalayas, that we may pass lightly over the first volume of Major Leveson, which is filled chiefly with accounts of what he did with the wild boar of the Deccan, with bison and elephant in the Wynaad and Coimbatore, with all kinds of game in the beautiful valley of the Deyrah Doon, and with the various species of wild sheep and goats to be found in the higher ranges. Some mild poetry, which may have elicited applause at the convivial meetings of the Deccan Hunt, might very well have been omitted; but the forest scenes are described with spirit, and a good deal of useful information may be gleaned as to dress and equipment, bore and character of weapons, the best mode of curing the skins and heads of wild animals, and other details important for sportsmen to master. Several readers will learn with surprise that such a veteran never "possessed a thoroughly trained *Shikari* elephant," and that he never seems to have been quite happy or at his ease in a howdah. But he does ample justice to the wonderful patience, docility, courage, and muscular development of these hunting allies, and we quite concur with him in thinking that to face a tiger, a rhinoceros, or an enraged *arna* buffalo, a staunch female is preferable to a male, whether *mukna* (tuskless) or tusked. Major Leveson appears at his very best on foot, tracking the wounded bison or the rogue elephant to the thickest coverts of a jungle in Southern India, and there are few perilous feats which he did not accomplish. Amongst other adventures, he was hugged by a she bear, fortunately without injury, as the animal's jaw had been smashed by a bullet; he speared a leopard on horseback, which shows that he must have had a steed inspired with the spirit of its rider; he disposed of a bear by the same process; he had the good fortune to witness a duel between a tiger and a bull-bison, in which the latter pounded his adversary to a jelly, but died from terrible laceration of the windpipe and the severance of some arteries; once, when out of breath, he failed to stop a charging elephant, was knocked over by the huge beast, and narrowly escaped with his life; and he earned the gratitude of some hundreds of villagers by dressing himself as a postman and ridding the country of a man-eating tiger which had been in the habit of lying in wait for this class of officials and pouncing on them at evening-time. We must observe, while on this part of the subject, that we are slow to believe, even on such excellent authority, that the hind-quarters of a newly-killed male elephant had been eaten by a wild boar. Possibly certain cuts or gashes noticed by Major Leveson may have been made by a hog, as these animals will often sharpen their tusks on anything. The abstraction of the flesh was doubtless due to jackals, ever ready to pounce on the slain.

Recent travellers have told us much of the physical features of the Caucasus, but little, comparatively, about its sporting capacities. Major Leveson narrates pleasantly how he enjoyed a drive for deer in the Kula range, and how he was entertained by a local Pasha on roast lamb, a pilau, and other orthodox Mohamedan dishes. But here we notice a curious inaccuracy in local nomenclature; a certain high peak, we are told, is called by the Georgians Sas-ka-Sundook,

* *Sport in Many Lands*. By H.A.L., the "Old Shikarry." 2 vols. London: Chapman & Hall. 1877.

or the "Mother-in-law's chest," owing to some local tradition. That a Georgian should speak the language of modern Hindustani would astonish us as much as any of the author's wonderful shots at large game, and the above expression is as good Hindustani as was ever spoken at Lucknow or Delhi. Our own explanation of the introduction of this irrelevant phrase is that about this time Major Leveson met a certain Fakir who had found his way to the Caucasus from Northern India and Persia, who told divers stories of the 16th Lancers and of crack cavalry officers, and who, we suspect, was a mutineer or fanatic conveniently absent from his native country after the events of 1857. This man may safely be credited with expounding a tale about an *afrit* or mountain spirit and his mother-in-law by the use of his own tongue. It is impossible to make out whether the author went to Sinai after the Caucasus; for, as we have said, chronology and sequence are entirely discarded; but he managed to kill a gazelle there and an ibex or two, and to meet with Bedouins who neither robbed nor detained him and his companions. If a sportsman will be content with small game, we should say that there are not many places where it is found in such variety or abundance as in Abyssinia. Geese and ducks, guinea-fowl in flocks, sand-grouse and spur-fowl, and several species of the bustard, are to be got by stalking and driving, and in seven months Major Leveson bagged two thousand head; but he evidently laid himself out for ground game of the biggest sort, and he tells us a good deal about the springboks of South Africa and the bison of the prairies. Indeed the larger part of his second volume is taken up with these two hunting-grounds. Those who like stories of the extraordinary perils attendant on sport in the former country will find enough to satisfy them, and there is a tragical story of the death of two of the party by a rogue elephant. But we care less about the cunning of the rhinoceros and the weight of ivory acquired by a few successful shots, than we do about what the Dutch call the *Trekboeken*, or periodical migration of "boks" and "boests" and gnus. Unluckily the author does not seem himself to have fallen in with these countless multitudes; and his descriptions are avowedly taken from Sir W. Harris and the late Mr. Gordon-Cumming. A considerable deduction must be made, we apprehend, for the inroads of later years; and the sportsman, like Xerxes, must sigh to think that in a short time these herds will have ceased to exist. But in the construction of a "skarm" for a night watch Major Leveson gives us his own experiences. A "skarm" is made by digging out a pit fourteen feet long, five feet deep, and four wide, lining the sides and the bottom, and roofing the top with logs strong enough to bear the weight of an elephant. Two sportsmen then ensconce themselves in the pit, look out for game, and fire from an opening left at each end. One of the best passages in these remains is the chapter in which we are told what was shot by this device, and what was seen before the serious work commenced. There was a pool near the "skarm," and the denizens of the forest came to drink there at evening, reminding us of a well-known picture exhibited by the Royal Academy last year. Feathered game and harmless animals quenched their thirst, untouched and unsuspecting, within pistol-shot of the hunters' den. The *keitloa*, or black rhinoceros, got the wind of their human foe, and lions sniffling in unpleasant proximity to Major Leveson and his snoring flote-tot companion, and paid for their intrusion. But the account of this exciting night watch, with the elephants and lions that were slaughtered and the zebras and quagga that were spared, ought to be read in the book itself.

In the neighbourhood of the Rocky Mountains enemies were encountered more dangerous even than the *bureau* or the *keitloa*. Poaching on the manor of Red Indians is quite sufficient to bring down the whole tribe on the whites. But the days of Uncas and Chingachgook have long passed away; and neither the Sioux nor the Dacotah were prepared for a contest with men who were armed with rifles of long range, and had had experience of Indian warfare. We are glad to record that the victors showed moderation in their success, and that the doctor of the party attended to the wounded Redmen, and laid them down where their friends could carry them away. With a portion of the Blackfoot tribe relations of amity were established, and the same medical man cleverly set the leg of an old Indian, broken by the kick of a horse. This part of the narrative derives further interest from the moral to which it points. The reckless slaughter of buffaloes at all times of the year for their skins, which fetch a good price at St. Louis, must soon materially alter the conditions of this sport; and it seems tolerably clear that, until the population shall be sufficient to occupy and reclaim the prairies, Congress will, as suggested, do well to reserve a tract of country and to define a season of the year within which the buffalo shall have protection. It is one thing to improve away an existing population and give up a fertile tract to wild animals, and another to let the animals be ruthlessly massacred before man is ready to take their place. At the present rate of consumption, other fields must soon be sought for by sportsmen who try to emulate the science, the perseverance, the skill in woodcraft, and the descriptive power displayed by the old Shikari in these volumes.

THE EPIC OF HADES.*

ALTHOUGH precedents might be cited for the rather odd plan of beginning an epic in the middle, and, on its meeting with approval, supplying a beginning and an end, it must be admitted

* *The Epic of Hades.* Books I. and III. By the Author of "*Songs of Two Worlds*." London: Henry S. King & Co. 1877.

that in any case it is a hazardous experiment; and though we cannot say that the present attempt to perform this feat is a mistake, it would no doubt have been better that the poem should in the first instance have been written as a whole. Some time ago the author of *Songs of Two Worlds* published another volume called the *Epic of Hades*, the reception of which has encouraged him to give the work a wider range by adding a preliminary and a concluding chapter. It may be remembered that the Second Book of the *Epic* consisted of stories which were supposed to have been told to one who in a dream had visited the weird land beyond Charon's stream, by ghosts who had had their errors and sorrows on earth, but were awaiting there the beatific end. The First Book pictures the more prominent of the evil-doers in classic fable as they appear to the narrator, undergoing suffering without end, in a self-wrought isolation. Four such famous sinners are singled out—Tantalus and Sisyphus, Phædra and Clytemnestra. In each case the poet indulges in the liberty of choosing his own version of the classic legend, and, as in the introduction of the death of Pelops, departing, where he sees fit, from the traditional accounts. We never heard, for instance, of the whisper of the tempter suggesting to Tantalus that what was needed to recover for him the "youth of joy and yore" was to sacrifice his best-beloved Pelops, and that the climax of his wickedness is "The stain of blood blotting the stain of lust"; but here, as in the handling of the tale of Sisyphus, the writer adapts the myths to suit the lessons which he has to teach, in portraying not only the physical pain and torture of wrong-doers, but "the pain of mind" which

Is fiercer far than any bodily ill.

This indeed stands out most prominently in the two women who are perhaps the finest creations of this First Book. True to the classic ideal of each, the author makes Phædra penitent for her ineffectual lie, and Clytemnestra impenitent, and ready in her intolerable isolation to deplore and regret nought except the absence of her paramour. In Phædra's case he makes some little variations of the original legend, which soften down the less natural parts of it, and enable him to bring out more forcibly the dread catastrophe. Thus Phædra represents herself as having been married to the aged Theseus when a mere child; Hippolytus, too, is not the hard misogynist of Euripides, but, after Phædra has quickened a flame in his heart, puts distance betwixt himself and her by a scroll which owns his love, but says he shrinks from this great wickedness; a scroll which acts upon the headlong woman as a motive for the vengeance which she soon compasses. He also departs from the plot of Euripides in making her address her false charge to Theseus by word of mouth, and introducing the suggestion of the son's fatal drive while they themselves are looking on; whereas the Greek dramatist makes Phædra hang herself on learning that Hippolytus rejects her advances, and leave behind her a scroll traducing him to his father, who straightway banishes him from his presence, to meet the same catastrophe, but without the same witnesses. Here is a description of Hippolytus:—

But evermore
Upon the high lawns wandering alone,
He dwelt unweid, weaving to Artemis,
Fairest of all Olympian maids, a wreath
From the unpolluted meads, where never herd
Drives his white flock, nor ever scythe the hath come,
But the bee sails upon unfettered wing
Over the springlike lawns, and Purity
Waters them with soft dews.

More original, and yet perhaps suggested by a word or so of Euripides, is Phædra's comparison of herself when smitten with love of Hippolytus, and apprised of his affinity to her:—

I turned away,
Like some white bird that leaves the flock, which sails
High in mid air above the haunts of men,
Feeling some little dart within her breast,
Not death, but like to death, and slowly sinks
Down to the earth alone, and bears her hurt
Unseen, by herbless sand and bitter pool,
And pines until the end.

Clytemnestra, as next presented, is also, in its way, a striking dramatic study. Her estrangement from her lord and subsequent faithlessness are referred to the discovery of his acquiescence in the sacrifice of their first born, Iphigenia, for whom she yearned more than for her younger children, seeing that, as she says:—

I had borne
Her in my opening girlhood when I leapt
From child to queen—but never loved the King.

With a heart thus tenantless, she is represented as too readily listening to the "dear and comfortable" words of Ægisthus, and, though not yielding at once, coming at length to such guilt that by the time the ten years' siege was ended, and the return of the conqueror from Troy was imminent, the murders that follow had been planned again and again:—

As 'twere
Some drama oft rehearsed, wherein each step,
Each word is so prepared, the poorest player
Knows his turn come to do—the solemn landing—
The ride to the palace gate—the courtesies
Of welcome—the mute crowds without—the bath
Prepared within—the precious circling folds
Of tissue stretched around him, shutting out
The gaze, and folding helpless like a net
The mighty limbs—the battle axe laid down
Against the wall, and I, his wife and Queen
Alone with him, waiting and watching still

Till the woman shrieked without. Then with swift step
I seized the axe, and struck him as he lay
Helpless, one, twice, and thrice—once for my girl,
Once for my love, once for the woman, and all
For Fate and my Revenge.

The whole passage is as tragic as it is graphic, and in the latter characteristic seems to recall to the mind's eye Flaxman's "Outlines." Then follow the hauntings of murder, the suspiciousness of a guilty conscience, the half yearning, half dread, to see the young Orestes's face, "lest from his eyes His father's soul should smite me." That end comes at last. The mother's heart sees through the disguise of pilgrim weeds, and longs to throw herself on the wanderer's neck, spurn her queenly rank, and forget all but her motherhood; but whilst guilt suggests a momentary hesitation, she hears the death-cry of Ægisthus, and sees her son confronting her with bloody brand:—

Oh! he was fair
And terrible to see, when from his limbs
The suppliant's mantle fallen, left the mail
And arms of a young warrior. Love and Hate,
Which are the offspring of a common sire,
Strove for the mastery, till within his eyes
I saw his father's ghost glare unappeased
From out Love's casements. Then I knew my fate
And his—mine to be slain by my son's hand,
And his to slay me, since the Furies drive
Our lives to one destruction; and I took
His point within my breast.

After the poet's apology for not multiplying examples of such chief sinners in Tartarus, and a poetic embodiment of Virgil, *Æn.* vi. 740, &c., showing that there is an end of Wrong and Death and Hell when time and suffering have effaced the stain from the soul, the scene changes to Hades, where

the ghosts which rose
From every darkling copse showed thin and pale—
Thinner and paler far than those I left
In agony, even as Pity seems to wear
A thinner form than Fear.

And then, after a "march past," so to speak, of Hades' chief tenants, which we have witnessed already, there is another change of scene to Olympus, where, upon the gentle slope

Of a fair hill, a joyous company,
The immortals lay.

Not dreams, indeed,
But something dreamlike were they. Blessed shades,
Heroic and Divine, as when, in days
When man was young, and Time, the vivid thought
Translated into Form the unattain'd
Impossible beauty of men's dreams, and fixed
The Loveliness in marble.

Under the guidance of Psyche the poet fancies himself privileged with a vision of each of the distinctive "godlike presences" in turn, expounding and justifying the principle which they severally represent. Artemis is made to call herself the "refuge of young souls," whom eager, vigorous youth connects with purity and the exercise of the chase, ere yet "the charm of sensual ease allures"; and whom sweet maidens connect with the moon and holy hymns and soaring liturgies. She identifies herself with the guardianship of fancy-free maidenhood before love wakes the soul, and is not altogether satisfied with the "sadder shrine which has replaced her own." The vision of Aphrodite which follows takes us into lighter moods, and the passage where the goddess boasts her still undiminished sway is, like another passage in Phædra's story in Part I., a poetic and graceful "locus classicus." Anon the rosy-mouthed goddess gives place to her virgin sister, Athené, charged with a brief to plead the delights of learning—

which grows great
And stronger and more keen for slower limbs,
And dimmer eyes and loveliness and loss
Of lower good—wealth, friendship, ay, and Love.

After Athené comes queenly Heré, whose province is to embody

a higher bliss than these, which fits
A mortal life, compact of body and soul,
And therefore double-natured—a calm path
Which lies before the feet, through common ways
And undistinguished crowds of toiling men.
And yet is hard to tread, though seeming smooth,
And yet, though level, earns a worthier crown.

The poet next turns to the contemplation of the Sun-God and Song-God, the ever-young Apollo, who illustrates his minstrelsy by passing in review each good attribute of his fellow-Olympians, teaching them that of every one in turn the world has need, though yet "there is a higher work than yours":—

To be fulfilled of Godhead as a cup
Filled with a precious essence, till the hand
On marble or on canvas falling, leaves
Celestial traces, or from reed or string
Draws out faint echoes of the voice divine
That bring God nearer to a faithless world.

Then follows the merging of all these godlike forms and embodied attributes into

a new innocence,
A child with eyes divine, a little child,
A little child—no more;

and the representatives of power and beauty, Heracles and Apollo, into a Heavenly Form—

Strong not to act but suffer: far and meek,
Not proud and eager: with soft eyes of grace,

Not bold with joyous youth; and for the fire
Of song and for the happy careless life
A sorrowful pilgrimage—changed, yet the same,
Only diviner far: and keeping still
The Life God-lighted, and the sacrifice.

Thus the author has achieved the task he set himself of showing, in no mocking or doubting spirit, that the myths of classic antiquity are capable of interpretation in pure faith by a modern singer; and that the sinners, sufferers, saints, and divinities of whom the legendary lore of Hades, Tartarus, Olympus tells, have a meaning intelligible to us, and that, "mutatis mutandis," the classic fables embody verities written

Upon the unchanging human heart and soul.

One element of the success which we venture to anticipate for this poem lies in the evident good faith of the author's religious tone, as well as in his entire purity of thought. Imbued from youth with the spirit of classic poetry, till it has become a part of his being, a sort of loyalty to both worlds fits him for the task of blending the lights and shades of mythland with the clearer truths of the fulness of time; and a simple and lucid style, a spontaneous power of song, and a bright, fearless fancy enable him to seize and retain the sympathies of his audience. We believe that the *Epic of Hades* will approve itself to independent and cultivated students as one of the most considerable and original feats of recent English poetry.

CAMILLE'S TORMENTOR.*

THE natural history of a noisy and dissipated young married lady cannot be a very easy or pleasant thing to write. Partly by a practised fluency, partly by a tolerably genuine sympathy with her wayward heroine, and even more by the audacious absurdity of her plot, the author of *Camille's Tormentor* has produced a study of a fast matron which is not very disagreeable to read. One is obliged to laugh over *Camille's Tormentor*, sometimes at, and sometimes with, the author; and though the story is tragic in intention, the most sentimental novel-reader will be prevented by the unreality of the whole affair from suffering too deep a sorrow. People who rightly object to the introduction of the Probate, Divorce, and Admiralty Division of the High Court of Justice into a novel will have to acknowledge that the legal proceedings in this tale are of a fantastic and airy sort far removed from reality. The writer has apparently wished to tamper with forbidden things, but lacked the courage to be naughty. If it is to be considered as an effort at what is politely called realism, *Camille's Tormentor* is a failure, for it really is not particularly offensive. One is left with the impression that the author could have written a pleasant and lively story, had not the laurels of certain other lady novelists tempted her on to dangerous ground.

Lady Amy Bellamy, the tormentor of her husband Camille, was gifted with an extraordinary temper. Her earliest exploit was to break all the mirrors of a spare bedroom in which she was locked up as a punishment, while still a child. "When I had been considered punished long enough, and was let out, the room was a wilderness of broken glass and china, and torn-down curtains and upset chairs. I was a bleeding little object, with hands that breaking the looking-glasses had covered with long cruel cuts." From this moment of her angel infancy Lady Amy was too strong for her widowed mother, Lady Rosehow, and when she insisted on marrying Camille Langdon, a half-French journalist whose home was Paris, Lady Rosehow gave in reluctantly. The story begins with a very fierce quarrel between the young married people. Lady Amy tells her lord that he is called "a half-Frenchman who lives by his wits," accuses him of kissing the bouquet of an actress, and demands a final and complete separation. Camille replies that he has unfortunately neither deserted nor ill used her; but he yields at last to what seems, from a later passage, to have been a habit of his, flings her from him, and goes to the theatre. Lady Amy went alone to the same place of amusement, and on her return home packed up her trunks, and went off to England by the early train. Camille next morning found that she had fled, sat down, as in duty bound, and wrote some chapters of his novel, then determined to follow his wife, and was prevented from taking that step by a sudden attack of brain-fever.

On Lady Amy's return to England, her prim and composed mother was rather annoyed than surprised. The younger matron declared that she was determined to be divorced, the older lady protested, and, after a few quarrels, Lady Amy went off to Wrode, a watering-place where her family was well known. By way of bringing back Camille, Lady Rosehow wrote him an extremely offensive letter, which he was able to read about two months after the date at which it was written. He made no reply, and Lady Amy, whose heart, we must remember, was in the right place, gave herself up to the gaieties of life at Wrode, and to secret chagrin. Perhaps the canvas is rather overcrowded with the figures of the people who make Lady Amy's court. There is a rich and ill-bred Mr. Conrady, who owns a yacht, and falls in love with the person and title of the heroine. There is a family of Mountjoys, with a flirting daughter, whose want of heart and false geniality are meant to be foils to the heroine's passionate and loving nature. The Mountjoys possess a governess, of the sort

* *Camille's Tormentor*. By the Author of "Rosa Noel," &c. London: Richard Bentley & Sons. 1877.

common in fiction, a beautiful, winning, appealing little creature named Georgie, who has, like all the characters, an immense talent for flirtation. To these must be added a Mr. Blagrave, a poet and painter and a man of property, who has a weak lung and is therefore "interesting." Lady Amy, with her "frou-frou hair," which is probably a euphemism for a fringe, might have been happy in this paradise of flirts, but she had a heart's sorrow and neuralgia. Her manner of dealing with the latter malady may be called heroic:—

As a severer throb than ever darted through her temples, she started up with a wild exclamation; (she always revolted against pain) and going to the bell, rang it violently, saying to Burrard who appeared,

"Toast a slice of bread, soak it in brandy, pepper it well with red pepper, and bring it to me *hot*!"

"Oh, my lady! You're never going to"—

"Yes, I am. Make haste. I am in torture."

"But your ladyship's cheek was blistered the last time—and going out to dinner to-night"—

"Be good enough to do as I tell you," said Lady Amy, stamping her foot.

Burrard started backwards, and retired, presently to return bringing, under protest, the brandied, peppered toast, smoking hot.

Life at Wrode was made up of yachting, love-making, and quarrelling. Mr. Blagrave was not captivated by Miss Mountjoy; she had a cheery manner, and "he hated what is called a cheery manner." With the governess, on the other hand, he was much pleased; and he sent her ten boxes of sweetmeats on her birthday. As a result, the young lady was told by Mrs. Mountjoy that "high social doings" were not for her, and she took refuge with the good-natured Lady Amy. That unattached matron had by this time inclined more and more to the courtship of Mr. Conrady, who let it be known that Camille Langdon was at Trouville, "looking very flourishing and amusing himself very well apparently." Camille had given but one sign of existence: his kindness had not been "unremitting"; for he sent large packets of banknotes to his wife. Persons who think of attempting translations from the French will hear with pleasure that Camille had made large sums out of an English version of a work by a M. Chateau-Reynard. Unmoved by these tokens of affection, and cut to the heart at the idea that her Camille "looked very flourishing," Lady Amy "goaded herself into the madness of action, and wrote a fourth letter setting forth her case to Mr. Smith." Mr. Smith was her solicitor, and her case was that, after she had deserted her husband, he still ruthlessly persecuted her by paying her debts. Here the fantastic element comes into the story in great force. Mr. Smith in some mysterious way takes Lady Amy's "case" into the place where such matters are decided; a host of witnesses testify to the guilt of Camille, for whom no one appears. The result of these somewhat hazy legal proceedings may best be described in the words of Camille himself:—

But one day arrived a notification from a lawyer of the suit you had in tated against me. Devotion, &c., I little knew what I was the victim of. You know all this part of it. How I made no defence; how witnesses jumped nimbly into the witness-box, and gave evidence against me. Hybrid creatures from Trouville; shady Englishmen who had been forced by disgrace into the humiliating shelter of a foreign land.

Having gained her case, Lady Amy was now free, as she put it, to "better herself" by marriage. She submitted to the nauseous courtship of Conrady, and fell so low as to allow him to instruct her in the pastime of skating on wheels. "I've been longing for this moment," says Conrady. "I should have longed for it still more insanely if I hadn't had you half in my arms all the afternoon." But though the toils of Conrady were gathering round Lady Amy, other and better influences had not deserted her. A mysterious Mr. Chilian Grey had taken a house in the neighbourhood. He was a very old man, with a grey beard and blue spectacles, and on one occasion, after he had been present when the heroine was singing, a low, faint voice was heard to whisper "Amy." The experienced reader begins to guess who Mr. Chilian Grey is, and his suspicions are soon confirmed. It chanced on the evening when Georgie had been warned against "high social doings" that she was run down by Mr. Grey's pony-carriage. He took her into his house, and gave her some green Chartreuse, when the shy, yet trusting, little creature expressed a wish to be his guest. "You can help me, beyond any words of mine to express, by giving me the shelter of your roof for a day or two." Thus appealed to, Mr. Grey threw off his disguise, his beard, spectacles, and so forth, and appeared as Camille Langdon. Georgie now understood the whole affair, and let Mr. Langdon know that Mr. Conrady had accused him of enjoying himself at Trouville. The result was that Camille seized the earliest opportunity to give Conrady "a blow across the face, a fierce blow right across the face that struck his hat off, and left him reeling, his dark, coarse hair ruffled by the wind." It had dawned on the mind of the injured husband that Conrady had aided Mr. Smith to win Lady Amy's "case" by suborning the "hybrid" witnesses at Trouville.

The rest of the novel is a game at hide-and-seek between Lady Amy, her lover, and her ex-husband. The latter secured an interview with his late wife in the manner reprobated as "hume sucken" by Scotch law. "The house shook, as with a crash he burst the bolt that fastened the door, and entering, sprang up the stairs, two steps at a time, and entered Amy's room." The scene that followed was tolerably impassioned:—

Not to clasp her, press his lips on her silken hair, would have required superhuman strength of will.

He clasped her to him until he felt the beating of her heart; he kissed her hair until his moustache was entangled in its silky tendrils.

Then he flung her from him, saying hoarsely and low.

"Get away from me! Do not touch me! You are mine no longer. You may belong to any man—but you can never again belong to me! Whirl!" with a harsh laugh, "it's shocking that I should be here in your room!"

Here it appears that when once a man gets into the inveterate habit of flinging his wife about, even years of absence will not cure him of the practice. We are not aware that there was anything to prevent Camille from marrying Lady Amy over again and starting afresh, and indeed we could quote a precedent for this course from a recent novel of some weight. This was a plan which occurred to neither party, for Camille is too much occupied in justifying his change "from Camille Langdon to Chilian Grey." "Doctors no doubt, the asses, would say that this was a piece of eccentricity, produced by a morbid condition of the brain resulting from my illness; I deny that; it was a reasonable thing to do, under the circumstances, what I did." Without leaning, as a rule, to medical evidence in support of pleas of insanity, we are obliged to side in this case with "the doctors, the asses." It may be admitted, on the other hand, that Camille's policy of disguise was as "reasonable" as the rest of his and of Lady Amy's actions. After their midnight interview, which ends with a clever description of a conflict between pride, love, and bad temper, Camille went abroad. Lady Amy took to champagne and chloral, and dragged the *ingénue* Georgie about with her to Brighton, Paris, and to other places, where she saw a great deal of rowdy company. This interfered with the love-making of the poetical Blagrave, who was accustomed to address Georgie as my "smile amid dark frowns," my "gentle tone amid rude voices." No voice could well be more rude than that of Lady Amy, who, by way of discouraging Mr. Conrady, said, "What a scrubby Cockney set you all are here at Brighton!"

It is scarcely worth while to follow Lady Amy through each step from respectability to something short of what is quite reputable. Camille at last invited her, as we understand, to fly with him to Italy:—

Then, Amy, come to the loveliest of all lands with me, where every fair creation that life knows ministers to the sense; and we will begin another dual existence, which shall be like the reunion of two once miserable souls that have passed through earthly sorrows, and have been divided and reunited by Death. Come!

The interview at which this invitation was given took place on the Downs at Brighton. Some one rode past swiftly. "It was Conrady, on a fiery Morocco barb, whose wild eyes and impatient hoofs told of its fierce, sun-land temperament." A man who rides fiery Morocco barbs on the Downs is capable, as the sequel shows, of any crime. We do not intend to reveal the catastrophe. Lady Amy "deserved all Folly's punishments, and she has received them."

The plot of *Camille's Tormentor* is the mere burlesque of a plot. The purpose of the author is, no doubt, expressed in a sermon on Georgie Glyn's:—"Deeds of love, and thoughts of true things and pure, cut us off from that wretched absorption in frivolity and worldliness which paralyses our better self." It is a pity that the author of *Camille's Tormentor* has thought it necessary to develop this moral in such a queer environment of people and circumstances as that which we have described. In many passages she shows observation, powers of description, and all through the book a confident fluency which leads her into curious errors. It is scarcely accurate to say that in the quarrel between two girls "rivalry and an invincible determination on the part of each to outshine the other were the *casa belli*." "*Les exploits de Digenis A. Kritas*" (vol. i. p. 275) is perhaps an American way of saying "*Les exploits de Digenis Akritas*." Trifles of this sort are hardly noticeable in the prevailing recklessness of a plot in which many really admirable sketches of impulsive character are lost and obscured. It is hard to combine the attractions of a novel of "fast" life with a regard for propriety and an inclination to enforce moral lessons. The writer of *Camille's Tormentor* ought to make her choice, and is quite clever enough to produce an interesting book which shall owe nothing of its interest to descriptions of dubious flirtations and impossible divorces.

AN EASTERN REFORMER.*

THE fast of Ramadan was over, and the exhausted people were assembled in multitudes in the great Mosque of El-Basrah—that pious city upon which, according to tradition, Allah daily casts an approving glance. A man stood on the steps of the pulpit, and, throwing away his kaftan, cried aloud, "O, ye who are here met together! Like as I cast away this garment, so do I renounce all that I formerly believed." This man was El-Ash'ari; and this day, three hundred years after the flight of the Arab prophet from Mekka, was an epoch in the history of Islam. For the faith of Mohammad has passed through more phases and experienced greater revolutions than perhaps any other of the religions of the world. In the earliest, the Mekkan phase—the shortest but the noblest of all—we see a simple and singularly lofty Theism, disfigured indeed by a startling realism, but nevertheless possessing a grandeur that Islam never saw again. At Medina the religion of Mohammad underwent serious and unhappy modifications. The prophet, partly in imitation of, and partly in opposition to, the Jews of Yathrib, introduced changes in his teaching which form a

* *Zur Geschichte Abu'l-Hasan Al-As'ari's.* Von W. Spitta. Leipzig: Hinrichs'sche Buchhandlung. 1876.

melancholy contrast to his earlier faith. Thus far Islam had been a religion of the Arabs. It had yet to learn the influence that culture can exercise upon faith. When the tide of Mohammedan conquest rolled northwards this influence began to be exerted. At the Court of the Khalifs at Damascus was collected whatever of intellectual life the Syrians had attained to under the rule of the Byzantine Emperors; and, low as was the standard reached, it was sublime compared with anything the Arabs had before known, and Islam soon gave signs of its influence. At this time Christianity also came into play. The Syrian Christians were well received at the Court of the Khalifs, and were often encouraged to discuss points of faith with their Muslim antagonists; and the result of the collision of the two creeds is apparent in the doctrines of some of the early Mohammedan sects. When the Abbasid Khalifs established their throne at Baghdad, Islam entered its fourth or Persian phase. Encountered by Parsees and Buddhists, the Muslim conquerors discovered that there were not a few things in heaven and earth not dreamt of in their philosophy, and they forthwith set about supplying the deficiency.

Thus we see Jewish, Christian, Syrian, and Persian elements successively introduced into the simple creed of Mekeah. But another influence was brought to bear upon Islam in its third and fourth phases, more potent than any of these; this was the philosophy of Aristotle. Introduced to his works in Syria, the uncultivated but always keen-witted Arabs soon began to take a delight in them which would have done credit to any mediæval university. Plato they never understood, and scarcely tried to understand; but Aristotle speedily created an enthusiasm which was fraught with the most momentous results for the Mohammedan religion. The immediate effect of the study of Aristotle's logical writings was the foundation of schools of Free-thinkers. Of these the school of the Mo'tezilis was the most important. They were what may be called the Broad Church of Islam. They repudiated the realistic ideas about the Deity which were rife among other Muslims; denied predestination and asserted the doctrine of individual responsibility; and scouted the legends of a sensual paradise and of bodily punishments in hell. Armed with all the resources of practised dialecticians, the Mo'tezilis soon found themselves triumphant. The orthodox divines, unskilled in debate, and able to substantiate their opinions only by vain appeals to *Sûrah* and *Sunnah*, were utterly worsted in their encounters with the Broad Church, and eventually declined to discuss matters of faith altogether. Orthodoxy seemed about to be exterminated, at least among the educated classes, and free-thought (of an exceedingly moderate and reasonable kind, be it said) appeared everywhere victorious.

It was at this crisis that El-Ash'ari arose, a prophet in Basrah. Born in the 260th year of the Flight, of an old Arab stock, he was brought up in the strictest orthodoxy; and, as a natural result, on arriving at years of discretion he found the trammels of his childhood's faith too narrow for endurance, and enrolled himself among the disciples of a celebrated doctor of the Mo'tezili heresy. Up to his fortieth year he adhered strictly to the tenets of his master, and was generally regarded as his most distinguished pupil; when a difference arose between them, which was attended with weighty consequences for Islam. Tradition ascribes the origin of this difference to a discussion between pupil and master on the necessity that God should do right, and the impossibility of evil with Him. El-Ash'ari put the case of three brothers, one of whom lived a righteous life, the second was godless, and the third died when a child. The master answered, "The first will be rewarded in heaven, the second punished in hell, and the third neither punished nor rewarded." To this his disciple objected. "But what if the third were to say, O Lord! if thou hadst but let me live I might have become pious, and entered into paradise like my godfearing brother?" The sheykh replied, "God would say, I knew that thou, hadst thou lived, wouldst have been godless and an infidel, and have gone into hell." El-Ash'ari instantly pressed the obvious rejoinder, "Then the second brother would say, O Lord! why didst thou not let me also die as a child, that I might not have sinned and come into hell?" The professor, fairly driven to bay, exclaimed, "Art thou possessed?" "Nay," said El-Ash'ari, "but the sheykh's ass is stuck fast on the bridge."

Whatever may be the historical truth that lies beneath this tradition—and questions like these have been asked and left unanswered among others than Muslims, and in later times than the tenth century—the fact is certain that El-Ash'ari, dissatisfied with the liberal school of which he had been a zealous supporter to his fortieth year, and perhaps filled with that longing after a definite and authorized creed which has brought about the most extraordinary revulsions of faith in men of all times and of all shades of intellect, gave himself up to a minute examination of the Koran and traditions, in order to test the evidences of orthodox Mohammedanism. After a period of severe mental struggle, not without the customary accompaniment of visions with which legend is wont to embellish such states of transition, he satisfied himself of the errors of free-thought, drew up a *Summa Theologica* of his reformed doctrine, and presented it in the great mosque of El-Basrah with the words and gesture already narrated.

The mere reaction of religious feeling from scepticism to strict orthodoxy would in itself be little. History has furnished countless instances of men who, weary of battling in the quicksands of free-thought, have taken refuge beneath the sheltering rock of a traditional Church. But it is not often that these men carry back with them into their peaceful retreat the broad principles and scientific methods which were formerly their greatest pride. They

generally look back upon their days of scepticism with horror and alight; and do not dare to approach ever so distantly their former cautions of evidence and methods of reasoning. El-Ash'ari's case was different, and it is this that gives it so great an historical importance. He saw that, without the logical training of their opponents, the orthodox party could not hope to maintain their ground, and he at once introduced into traditional Islam the dialectic system of the heretical sect in which he had been educated. This was his work; not to give the people a heaven-born revelation, not even to elaborate a new interpretation of Mohammed's mystical sayings; but simply to give the orthodox the weapons of the sceptics, to teach the upholders of the traditions how to defend them against the skilful arguments of their adversaries. It seems but a slight thing, this moulding of the Arab material in a foreign form, this grafting of Greek logic on Mekean dogmas; but it produced astounding results. It effected nothing less than the overthrow of the liberal school, and the establishment of Ash'arite Islam, or at least forms of Islam mainly founded on Ash'arite principles, over the greater part of the Mohammedan world to this day. With us in the present time, the vanquished indeed claim more sympathy than the victors. The defeated liberal party was really nearer to Mohammed's earliest teaching than was El-Ash'ari; and from the point of view of comparative religion there is no question that the Mo'tezilis were far in advance of the orthodox divines. Yet, whichever way our sympathies may turn, it is impossible not to recognize the importance of El-Ash'ari's place in the history of Mohammedanism.

The remainder of the life of our reformer was spent in disputations at the mosques, where he would hold at bay a ring of sceptics, making them wonder at the keen edge of his replies; and in composing polemical treatises, of which about a hundred, only one-third of the whole number, have come down to us. After five-and-twenty years thus spent in doing battle with the heretics, he died at El-Basrah, in A.D. 935, the most distinguished man of his time. It is not creditable to his charity to have to record that the disciple on whose breast he lay heard the dying man mutter these last words:—"The curse of God be on the Mo'tezilis, their work is delusion and lies."

Dr. Wilhelm Spitta's excellent biography, in which will be found extracts from the writings of the Eastern reformer, is a valuable contribution to the history of the Mohammedan religion. Houtsma has already treated of the contentions in Islam up to El-Ash'ari's time, and Professor Meinen of Copenhagen, we understand, has presented to the Oriental Congress at St. Petersburg, a work on the Reform of El-Ash'ari in which he carries the history beyond the lifetime of the reformer. The various developments of Islam form a curious study, and not the least interesting chapter is the one that Dr. W. Spitta has treated with so much learning and ability.

LINDORES ABBEY.*

UNLIKE most of the abbeys in Scotland, Lindores did not owe its foundation to the "Sair Samet for the crow," but to his grand-son and namesake, the Earl of Huntingdon. This David, the original of Sir Kenneth of the *Talisman*, has had many romantic adventures laid to his credit on no better authority than the very imaginary history of Hector Boece. The story ran that he founded Lindores as a thank-offering to commemorate the last of his many memorable escapes, when, on his return from the Crusades, he was shipwrecked near Dundee. Unfortunately, Fordun, who lived nearer David's own time than Boece, says not a word of the shipwreck. It seems strange that the grandfather of Robert Bruce, and the common ancestor from whom all the claimants of the Scottish crown at Norham traced their claim, should be best known in history by the title of the English earl-dom which he inherited from his grandmother, the daughter of Waltheof. He lived so much in his English castle of Fotheringhay that his granddaughter Devorgilla, the mother of John Balliol, was known as the "Lady of Fotheringhay." But at that time the distinction drawn between members of the same nation living north and living south of the border line, and the bitter hostility which was created by the War of Independence, were as yet undreamed of. Wintoun tells us that England and Scotland were "as one." In those times the English could "roam scathless through Scotland as they pleased, and the Scots could do so throughout England, though laden with gold or any ware whatever." It followed then almost as a matter of course that, when the Earl of Huntingdon built the great abbey which he endowed largely with his English as well as with his Scottish lands, he should build it in the English style. The site which he chose for it was both picturesque and fertile. The stately abbey, with its red sandstone walls and pillars, and facings of grey, rose on the bank of the Tay, with the screen of the Ochils behind, and in front the "fair Oarse of Gowrie," stretching away to the girdle of fantastic peaks that shut in the droned Highland herds. Wood and water were there in plenty; and the soil, besides its fertility, had the excellent quality of being as fatal to noxious reptiles as the "Isle of Saints" itself.

Unfortunately, the walls of the abbey have passed away almost as completely as the memory of the monks, of whom Mr. Laing

* *Lindores Abbey, and its Burgh of Newburgh; their History and Annals.* By Alexander Laing, F.S.A. Scot. Edinburgh: Edmonston & Douglas. 1876.

tells us that no tradition remains save the proverb "The bells of the abbey will aye be gotten rung":—

There is no entire portion of Lindores Abbey remaining; and until within the last few years, so completely were the ruins hidden under mounds of their own rubbish, that even the most experienced in ecclesiastical structures could with difficulty make out the ground plan of the building. The ruins were so completely overgrown with trees and shrubs, and the place was in such a state of utter desolation and neglect, that it was known in the neighbourhood solely by the name of "The Wilderness."

Quite recently, however, the rubbish has been cleared away so as to show the stumps of the pillars, and to make it possible to trace the plan of the building. Part of the walls of the chancel and of the tower are also still standing. The only part, however, which remains entire is a groined arch leading into the cloister court. This complete destruction is not the work of the Reformers; for Lindores was let off easily by them. John Knox writes of the visitation of the monks of Lindores:—"We reformed them, their altars overthrow we, their idols, vestments of idolatry, and mass-books we burnt in their presence, and commanded them to cast away their monkish habits." But he says not a word of pulling down the walls till not one stone is left upon another, as we now see it; for the abbot had had the good sense to submit himself to the "congregation and to put some reformation to his place." The work of destruction was stirred not by religious zeal, but by the more sordid motive, love of gain:—

The work of spoliation has gone on so gradually, that it has generally escaped observation and record; but in the charter chest of Newburgh, there is preserved a record of an appropriation and destruction of such an extensive character, that the heirs of the perpetrator had to refund to the proprietor, Alexander, Lord Lindores, Slate, timber, stones, hewn and unhewn, were carried off for the erection of a house in Newburgh, the mouldings of the doors and windows of which still bear witness from whence they were obtained. On the 18th April, 1743, the following occurs in the records of the kirk session of Newburgh:—"To James Bisset for bringing the two stone from the Abby for John Black's House co. 03. 00;" an entry which shows that the abbey was used and recognized as the quarry for the neighbourhood.

Even so recently as five-and-twenty years ago, the foundations of a row of pillars and the remains of a spiral stair, which were dug out of the rubbish, were carried off in the same unscrupulous way.

Like the ruins of the walls the historical records of Lindores are of the most meagre. The abbots took less part in public affairs than we should have expected from the heads of a house whose revenue was estimated at 4,000l. sterling yearly. It is only occasionally that the national history touches the quiet cloistral life within the abbey walls. In the year 1218 the Prior of Durham, who had been sent to remove the interdict laid on Scotland in the preceding year, lodged at Lindores on his way home, and narrowly escaped being burnt to death in his room by a fire ascribed to the carelessness of his chamberlain. So much was he injured by it that he never reached Durham, but died at Coldingham. It was at Lindores that Alexander, Prince of Scotland, who would have been the fourth of his name had he come to the throne, died, and thus left the way to the throne open to the descendants of the founder of the abbey. In the long war caused by the contested succession we find occasional mention of Lindores. It was visited both by John Balliol and by Edward of England.

One of Wallace's victories was won at Inneside, close to the abbey lands, and in the abbey itself, in 1306, Campbell of Lochow and Sir Alexander Seton signed a bond pledging themselves to stand or fall with Robert Bruce. One of the fine stone coffins that have been dug out of the ruins must have held the wasted frame of that unfortunate Prince of Scotland, the first Duke of Rothesay, who was buried here apart from all his race. To the quiet of the cloister of Lindores the last of the Black Douglases, after his thirty years of exile, came to pass the five years of rest and peace which ended his chequered life. Though the abbots kept aloof from the turmoils and party feuds which divided the Court and country, they seem to have been foremost where any interest of religion was concerned. The "Official of Lindores" headed the Council by which Resby, the first heretic burnt in Scotland, was tried and condemned, and succeeding abbots took an active part in the martyrdoms of both Patrick Hamilton and Walter Miln. The last abbot of Lindores was Leslie, afterwards bishop of Ross, the staunch follower and friend of his unfortunate Queen, who, by a strange freak of fortune, met the tragic end of her unhappy life in the very castle where her ancestor, the founder of the abbey, had lived so long. After the deposition of Mary, when Leslie left Scotland, the abbey lands passed into the hands of another Leslie, Patrick, son of the Earl of Rothes, who held them as lay commendator. He was created Lord Lindores by James VI. in 1606, and at the same time "our said sovereign Lord and estates aforesaid, dissolvit, suppresses, extinguishes, and abolishes the foresaid abbey and monasterie of Lindores, Memorie, and name thereof, with the baill ordouris, institutions, and foundationes of the same simpliciter and forever." From this time forth the dwellers in the new burgh seem to have done their best to aid in the extinguishing and demolishing of the abbey by treating it as a convenient quarry from which they might steal stones ready hewn for their own houses.

So ends the story of the abbey. But if there is little to be told of the nature of its buildings, or of the manner of life of the brethren within them, there is much to be told about the new burgh that had gradually grown up outside its gates. The greater part of Mr. Laing's book is taken up with extracts from the records of the Burgh Courts and of the Kirk Sessions. These extracts are both interesting and amusing. With their help we can conjure up a very lively picture of the social state of a Scottish burgh little

more than a century ago. In those days the "Town-head" was an officer of much importance, and the winding of his horn through the streets on a summer morning was the signal which bade the burghers drive forth their cows to be led by him to the common pasture outside the town. They held their arable land in common too. And the comparative value of the "rigs" allotted to them on the "Wodrige," as this land was called, was an unfailing source of quarrel and dispute. In those days potatoes were unknown. The first grown in the neighbourhood were planted after the "Forty-five" and were looked on as a great delicacy. Newburgh did not rise to a position of any importance till after the introduction of the linen manufacture. The whole population then took to the spinning and weaving of linen. Maid-servants were bound to spin so many yards of yarn weekly. The cottars' wives used to gather round the laird's lady and have what would now be called a "spinning bee," in which each strove to outdo her neighbours in dexterity and swiftness, and even the farm-labourers had part of their wages paid in lint. The strictest rules were made to keep up the credit of the town manufacture. No one might set up as a master weaver without becoming surety to the magistrates that he would hold himself bound only to produce faithful and honest goods. No web of linen was allowed to leave the burgh till it had been examined, approved, and stamped by the stamp-master. Perhaps it might be as well for our national honour in these days of shoddy and of sham if some such restrictions were still in force.

The records of Newburgh, like those of all other Scottish towns, are disgraced by the frequency of trials and persecutions of witches. They also abound in cases of Sabbath-breaking and profane swearing, and it is a little amusing to find that more abstinence from work on Christmas Day, though unaccompanied by any feasting or merry-making, was considered as a more grievous crime than even a "Sabbath breach." The temptation to keep Christmas in defiance of the law must have been strongly felt in a district where the attachment to the House of Stuart and to the Episcopal Church was very strong. In the counties of Fife and Kinross, at the ejection that followed the Revolution of 1689, fifty-five ministers were turned out of their livings, and only sixteen stayed in; and we find the records of Presbytery after Presbytery in which ten out of twelve or fourteen out of fifteen of the clergy lost their livings rather than become Presbyterians. The result of this was that in many parishes for years there was no service of any kind. Mr. Laing tells us that "for nearly eight years (1689-1697) there is no record of public worship having been observed in Newburgh Church, and similar neglect occurred in numerous other parishes."

Newburgh played no active part in the "Forty-five," though many of the neighbouring lairds took up arms for Prince Charles; nor did it suffer much from the visit of the Highland army. A pair of shoes, whether exposed for sale or on the feet of the owner, seems to have been the one temptation they could not resist. A party of the "petticoat-men" entered Arngask Church one Sunday morning while the service was going on, when they very quietly sat down among the congregation, unshod every man his man, and went off delighted with their spoil. Mr. Laing has added to his notice of the burgh and the abbey a chapter on the lairds' families of the country round, and on the persons of note who sprang from them. Among these was Lady Halket, who turned doctor, and whose skill in medicine was so great that we find in the town records entries of moneys paid for the conveyance of sick persons to consult her at her house. After the battle of Dunbar "she and her women dressed about threescore poor wounded soldiers." To be sure a little knowledge must have gone a long way in a country where not so very long ago the favourite treatment for sore throat or hooping-cough was "to sew a living caterpillar between two pieces of flannel, leaving the animal sufficient room to crawl, and then to tie the flannel round the neck of the person affected." As the worm died the patient was supposed to recover. "Another celebrity who had some connexion with Newburgh was Sir James Balfour, of Dennilt, the author of the *Annals of Scotland*. His vast collection of rare manuscripts met with the same mishandling as the ruins of the abbey. Many of them were used by the shopkeepers of the town to wrap up their parcels.

Mr. Laing has also devoted a chapter to a description of the "standing stones" of the neighbourhood, at Lindores and at Mugdrum, and he also notices the Macduff Cross. He seems inclined to follow the opinion of Dr. Stuart as to their origin and inscriptions. His book closes with a chapter on "Old Customs and Folklore." As his information has been principally collected from the lips of old people who remembered the fashions of their youth, it contains some very curious particulars about many superstitions and observances that have now quite passed out of mind.

THE MAID OF STRALSUND.

STRALSUND had a siege like Saragossa, but the Maid of Stralsund is not historical like Augustina. The case is otherwise with several of the other characters in Mr. de Liefde's romance; for a romance we suppose we must call it, and not an "Epoch of History," to which species of publication it bears no small resemblance. We have no desire to institute any comparisons, invidious or otherwise, between Mr. de Liefde's abstract

* *The Maid of Stralsund: a Story of the Thirty Years' War.* By J. B. de Liefde, Author of "The Beggars," &c. the Founders of the Dutch Republic." London: Hodder & Stoughton. 1876.

of part of the history of the Thirty Years' War, with which he has chosen to connect his singularly simple tale of love and hate, and so unromantic a contribution to historical study as Mr. S. R. Gardiner's recent publication in Mr. Morris's series. Mr. Gardiner happens to be master of his subject, and we do not say that Mr. de Liefde has not very creditably got up his. The latter, however, comes before us as the author of an historical novel, and we are not called upon to criticize *The Maid of Stralsund* under any other aspect.

The historical novel is a kind of literature before which even sturdy readers are apt to wax faint, and which yet, if one may judge from the ratio of the supply to the demand, seems successfully to defy the many difficulties and dangers which beset this class of composition. When a man—or a woman, for ladies seem largely to affect this kind of fiction—sets about writing an historical novel, he or she can only have one of two intentions. Either the object of an historical novel is to secure a background at once suitable and striking to a story which claims a substantive, though not a wholly independent, interest of its own; or the more ambitious design of such a work may be to treat an historical period, episode, or group of characters as itself the subject of the story, and, while not losing sight of the artistic conditions of the work, to write a chapter of history, so to speak, by the light of the imagination. Historical novels of either kind have their justification, and have had their success. To instance more recent writers only, and not diverge into a discussion of the place belonging to Scott in a branch of literature more especially associated with his name, George Eliot's *Romola* is an admirable illustration of the former kind of historical novel, and the late Lord Lytton's *Harold*, which has justly won praise alike from historical students and from lovers of fiction, of the other. Let us inquire to which class, if to either, the book before us is to be assigned.

In the first place, it may readily be conceded that no better background could have been suggested for any story of incident, character, or manners (and the historical novel, at all events, must include all these elements) than that which Mr. de Liefde has in the present instance chosen. His tale begins with the siege of Stralsund, and ends with the battle of Lutzen. The period which it includes is therefore at once the central and indisputably the most generally interesting part of the great war, and its scene is the theatre of the most wonderfully rapid and changing succession of events forming part of the history of the struggle. The steadiness of the burghers of Stralsund may have been determined by a mixture of motives, and at times may have been qualified by conduct in which prudence tempered heroism; but its result was to break the seemingly irresistible tide of Imperial aggression—perhaps (though historians have differed, we believe, on this point) to relegate for ever into the realm of delusions the vastest scheme of ambition conceived by the House of Hapsburg in the days of its dynastic duality. A fancy which it certainly destroyed was that of the irresistibility of Wallenstein's military genius. The famous story of his declaring to the envoys of Stralsund that he would have their city were it bound with chains to the heavens, sufficiently marks the popular consciousness of the check which his failure before Stralsund imposed upon Wallenstein's ambition, of the disbelief which it first aroused in others—perhaps in himself—in the all-sufficiency of his star. There is no reason, we may remark in passing, to doubt the fact that Wallenstein uttered such a threat, merely because the expression used by him was not one of his own invention. The saying of Wallenstein is mentioned, as the late M. Fock informs us in his volume on Stralsund history, by two independent contemporary authorities. On the other hand, it would not appear to have been uttered on the occasion to which later tradition has usually attributed it, and on which it is duly introduced by Mr. de Liefde. But the consequences of the siege of Stralsund were not merely negative. The feebleness of the Danish efforts in aid of the Stralsunders opened the door of Germany to a mightier champion than Christian IV.; soon the Swedish deliverer was on Pomeranian soil, and was preparing for his victorious march. The awful fate of Magdeburg—on whomsoever its responsibility is to be cast, or between whomsoever it is to be divided—made Gustavus Adolphus the inevitable leader of the whole Protestant North of Germany; at Breitenfeld he won his first decisive victory; and Wallenstein's disgrace and Tilly's death seemed to leave him without a military opponent worthy of his steel, as in the Protestant councils his daring genius was without a rival. Already the present, and perhaps the future, of the Empire seemed within his grasp, when, under new conditions and with newly-expanding designs, Wallenstein assumed the command once more. At Nürnberg he baffled the attempts of the hitherto invincible King to force his position; and at Lutzen the glorious career of Gustavus came to a sudden end. Henceforth the conditions of the struggle changed; and what remains of the history of the Thirty Years' War, though full of the most varied interest, is, as a whole, in its campaigns as well as in its negotiations and intrigues, a tangled field, through which, whether in historical or in imaginative composition, only a bold and firm foot is likely to find its way.

The number of famous characters which crowd this chapter of history might fairly be described as all but unsurpassed. There is the Lion of the North himself, with his companions in arms and his great counsellor; there is Wallenstein, of whom Schiller has given so wholly ideal a picture as to have left abundant opportunities for pictures of a very different kind; there is Tilly, the Tilly of Protestant tradition and the Tilly reconstructed by Catholic zeal. Of lesser men there are others whose careers and

characters seem to mark them out as figures excellently suited for historical romance—such as Arnim, the general who conducted the siege of Stralsund before Wallenstein's arrival. He might (had Mr. de Liefde thought fit) have been drawn as a type of the restless military ambitions and the extraordinary personal careers of the age. A Brandenburger and a Protestant by birth, he served in turn under Gustavus, under Sigismund of Poland, and under the Emperor and his generalissimo. He then again fought under Gustavus as the commander-in-chief of the Saxons, and in the end closed his career as a loyal servant of the Emperor. It might have been worth while to make something of such a type, which yet had quite sufficient individuality to make it a type and something besides. Of other leading or secondary personages there are more than the most crowded canvas could find room for; in short, the characters are so many, and have for purposes of fiction been so little used, that an enterprising novelist would here find a whole gallery ready to his hands, and be only embarrassed by the abundance at his disposal. Finally, there is the whole mass of contemporary life in court and city, and in camp and field, with its confusion and conflict of nationalities and creeds, its chaos of interests and superstitions, discernible to us in the infinite variety of its component elements by the light of evidence of all kinds—State papers and personal narratives, and letters and songs. A self-painted picture of manners presents itself which tempts, and has tempted, the most skilful of artists to its reproduction; nor is any one novel, or any one novelist, likely to exhaust so incomparably copious a store.

Mr. de Liefde is accordingly happy in the choice of his theme, so far as it connects itself with history. If he has notwithstanding contrived to produce a book of almost exceptional dulness, his workmanship must be somehow in fault. He begins in strict accordance with the orthodox fashion of historical novels, with "There was a strange commotion in the streets of Stralsund one morning in April, 1628"; but after a few pages describing the agitation caused in the city by the demand for the admission of an Imperial garrison, and the supposed unwillingness of a Calvinist preacher to sign the counter-declaration of the burghers of fidelity to the Augsburg Confession, the author considers that "it will not be out of place here to relate some of the circumstances which gave rise to this state of affairs." We are therefore invited to brush up our history, to remember the previous course of the war, and the antecedents of "the Duke of Waldstein, or Wallenstein"—a designation not so scrupulously accurate as Mr. de Liefde seems fondly to suppose. Thus fortified, we resume the delights of fiction:—"The weather was beautiful," and the lovers are introduced. They consist of the Maid of Stralsund, daughter of the untractable Calvinist pastor aforesaid, her betrothed, Theodore, a cross-grained youth, of the most jealous disposition and ungovernable temper, and Captain Harry Wyndham, an officer of the Scottish regiment in the Swedish service. Theodore is the only attempt at character in the book, and is not ill sketched. The rest are the most ordinary figures of this class of fiction, whose sentiments, speech, and conduct can be predicted with the certainty with which the playgoer speculates on what he has to expect from the most time-honoured types of melodrama. Theodore outrages his betrothed's feelings by his furious jealousy, and all but breaks his worthy father's heart by his intended betrayal of the liberties of Stralsund. Finally, he takes service under the Imperialists, and dies in his father's arms at the last battle mentioned in the book. Wyndham is wounded and imprisoned, but freed in time to witness Magdeburg's doom, to see Magdeburg avenged, to fight at Lutzen, and to depart in peace with Helena to Scotland; "and in the archives of the Wyndham family there is a somewhat voluminous document by another Helena, beyond doubt a daughter, which relateth much of this history." Helena herself is lost and recovered, and, notwithstanding a terribly suspicious visit which she pays to Wyndham's quarters on a mission of charity, leaves the story, we need not say, without a stain upon her character.

The narrative which leads to these not unexpected results shifts its scene from Stralsund to the camp of Wallenstein, and afterwards to Wyndham's prison on the Lake of Teuplin, to the camp of Gustavus, to Tilly's council of war before Magdeburg, to the "Bishop's city" itself, and to numerous other places. Parts of the siege of Stralsund are described with sufficient detail and vivacity to interest the reader; but the camp of Wallenstein has, unless we mistake, been sketched with more striking vigour before; and in the latter part of the book we feel that the author is embarrassed by the discrepancy between the vastness of his background and the smallness of his story. The gipsy, Joe Marks, is, however, a well-contrived and judiciously introduced link; a little more elaboration, for which the materials were abundant, would have made him and his doings a most characteristic element. On the other hand, Mr. de Liefde is conscientiously anxious that the interest excited by his story should not interfere with the instruction the reader may derive from its historical connexion. After Wyndham has escaped from his imprisonment, he requests his friend Bayerley to favour him with a summary of the events which have taken place in the North, and by this artful device we are enabled to refresh our knowledge as to the Edict of Restitution and the coming of Gustavus. After Harry and Helena have made their way safely from the ruins of Magdeburg to the Swedish position, the author, in his own name, requests the reader to "step over an interval of rather more than a year," but furnishes him with a short chapter of the progress of the war in that year to console him for the loss. And at the end of the volume, when the lovers are settled and done with, we are

not allowed to give them our blessing without being invited to listen to a few concluding words as to the issue of that great war, part of which the author has "endeavoured, though but imperfectly, to describe."

In short, Mr. de Liefde, although apparently not without previous experience as a historical novelist, cannot be congratulated on having successfully accomplished his task. As a fiction his story is uninteresting, while of his historical materials he has only occasionally made a skilful use. If intended for a novel with an historical background, *The Maid of Stralund* is constructed with inadequate care and art; as a romantic picture of history it fails, except here and there, even to approach the capabilities of its theme. The characters which it introduces from history are the merest outlines, just recalling, not in any sense reproducing, their originals. The style is completely colourless; the dialogue would suit the Seven Years' War as well as the Thirty, and the Seven Days' War quite as well as either. Wholly inoffensive as the book is in manner, and revealing as it does greater felicity in the choice of subject and more conscientiousness in extent of reading than is usual with the average of historical novelists, we cannot but describe it as, what neither an historical novel nor any other book has a right to be, purely sedative in its general effect.

AMERICAN LITERATURE.

WE have often mentioned the extraordinary liberality and zeal displayed by the American Government in the collection and publication of information of a character which, so far as we are aware, is left by all other Governments to the labour, the energy, and the enterprise of private persons. That they have at great cost thoroughly explored and mapped out, not merely the comparatively settled and inhabited States of the Atlantic and Pacific Coasts and of the Mississippi valley, but the whole of those vast plains which lie between the valley and the base of the Rocky Mountains, and the almost equally extensive highland district of which these mountains are the centre, and which extends from the Canadian frontier to the Gulf of California, is a proof indeed of great activity and enterprise, and of a foresight which provides for future generations much that other States would leave to the time when it should become actually necessary. Still this task, great as it is, falls properly within the scope assigned by highly civilized communities to the duties of administration. But the work of these exploring expeditions is not merely engineering and geographical, they not only do for an almost uninhabited territory nearly as large as Europe what our Ordnance Surveys have done for the British Islands, but they do also, systematically and at the public cost, much of the work that our scientific societies, our geologists, naturalists, and men of science generally have done, separately and without organization, each for a single district. Each important exploring party consists not merely of engineers and topographers, but of botanists, geologists, and paleontologists, all highly competent, and many of them famous in their several departments. Each of these is instructed to regard his special task as forming a no less essential part of the entire business of the expedition than the proper surveying work of taking the heights of mountains and tracing the course of rivers; the hammer and the gun are employed as diligently as the level and the theodolite.

When the work is complete, or when a portion of it capable of being separately treated has been accomplished, the Reports which describe the past and present flora and fauna of the Territories are received with as much attention as those of the engineers to whom the chief conduct of the survey has been entrusted; and they are published in a style, often with illustrations, which indicates a zeal for the collection and diffusion of scientific information, and an indifference to cost and to mere practical utility, such as only a Government, or a very wealthy scientific society, could afford to display. The great treatise now before us on the natural history of a part of the Western Highlands* is one of the most remarkable examples of this kind of official interest in science for its own sake. In the whole of an immense quarto volume describing in great detail the animal life of all kinds to be found in that comparatively barren region there are probably not a dozen pages which can be of any immediate practical service to settlers, whether agriculturists or miners. It is probable that not a dozen copies of such a work would be purchased by private persons, its bulk being so great, and the number of similar volumes published from time to time so large, that even scientific students have not leisure to read more than such small portions as touch their own immediate subjects; and such students will commonly find the works they require in public libraries easily accessible to them. We presume, indeed, that it is to these libraries, the number of which throughout the United States, and especially in the North and West, is one of the most striking evidences of the high value set by so practical a people as the Americans upon pure science and literature, that Reports of this kind are almost exclusively distributed. We hope that our own public libraries also are furnished with the scientific "blue-books" published by the American Government; for there are few collections of scientific treatises in which a larger mass of interesting information of all kinds is to be found. A digest of these treatises, extending as they do over a long series of years and describing nearly the whole of the geography, geology,

past and present vegetable and animal life of the central portion of the North-American continent, would be indeed a work of great labour, and would require the co-operation of many scientific men in various departments, but would be a most important contribution to what may be called the statistics of science.

We have received two works of the "Centennial" class, got up with that elaboration and costliness which are characteristic of American publications intended for the glorification of the Union or of individual States, and of more interest and value than most of those to which the Exhibition at Philadelphia has given birth. The first of these is an elaborate and minute account of the Art Galleries of the Exhibition*, illustrated by a number of excellent engravings of the more important and valuable paintings and sculptures therein exhibited. In point of beauty and elegance it is well worthy of a place among drawing-room books; in real merit and interest it exceeds most volumes of that class. Another and still more elaborate work, also most expensively printed, bound, and illustrated, is a history of American progress, social, industrial, commercial, and political, during the past century†, dealing more fully with the trade, manufactures, and inventions, and even with the fashions, customs, and amusements of the country, and the changes which these have undergone since the foundation of the Union, than with mere politics.

The interest belonging to the Vienna Exhibition of 1873 has to a great extent been exhausted by mere lapse of time, and we should have thought that, in the United States at least, it had been completely forgotten in the infinitely greater interest excited by that of Philadelphia. But the Government has thought it worth while to publish an elaborate introduction to the Reports of the Federal Commissioners at Vienna‡ containing, not only abstracts of the principal Reports of international juries and foreign officials upon articles exhibited by Americans, but also a disquisition on the history of International Exhibitions generally, going back to the fairs of the middle ages, and describing in some detail the "inception," arrangements, and organization of every Exhibition of this class that has taken place since that of 1851; those, namely, of Dublin and New York, in 1853; of Paris, in 1855 and 1867; and that of London, in 1862. The technical character of the work will render it useful rather to those manufacturers who find the chief successes of their craft described therein, and who will learn from it what foreign observers thought of the merits and failures of American arts and workmanship, than to the general reader.

The American Revolution left behind it a vast mass of documents, public and private, illustrating both the course of public events and popular opinion and the individual views and personal character of the colonial leaders. Among the latter not the least busy and useful, though bearing no military character and less prominent than many political chiefs, was Mr. Adams, at one time the representative of the United Colonies in France, and later the negotiator of the treaty by which their independence was recognized on the part of the mother-country. He seems to have used his pen with a frequency and a fluency for which it is not easy to account when we consider how fully his time must have been occupied on more important work; but his diligence has been the means of transmitting to posterity a quantity of matter illustrating various phases of the Revolution as seen from different points of view, and the characters of a number of his principal colleagues, which possesses great historical interest. With his wife in particular he seems to have kept up a very close and constant correspondence, noting and commenting upon almost every important incident of the time. His descendant, Mr. Charles Francis Adams, has on former occasions published selections from these letters and from the replies of Mrs. Adams, and these publications have been received by his countrymen with great and general interest. The present work§ contains the letters both of husband and wife during the period of the Revolution—that is, from a date shortly subsequent to the destruction of the tea in Boston harbour down to the signature of the final treaties between Great Britain, France, and the United States. The first letter of Mr. Adams contained in this volume is dated the 12th of May, 1774, the last the 18th of February, 1783; and the selections from the correspondence during this period occupy more than four hundred closely printed octavo pages. These domestic letters are of course a very small fraction of the entire correspondence in which Mr. Adams was engaged during those years, and constitute perhaps its least important, but not its least readable and interesting portion. They strikingly show the bitter feeling towards officials and loyalists, the fierce party spirit and bigoted political intolerance, which pervaded Massachusetts, if not the other colonies, even before the outbreak of the war; and which, much more than the incompatible pretensions of the Imperial Parliament and the Colonial Legislatures and people, made war inevitable. When we find not merely the populace and the

* *The Art Gallery of the Philadelphia Exhibition.* Illustrated by Engravings; and with Introduction and Descriptive Text. By Edward Strahan. Philadelphia: Gebbie & Barrie. London: Sampson Low & Co. 1877.

† *The American Centenary: a History of the Progress of the Republic of the United States during the first Hundred Years of its Existence.* By Benson J. Lossing, LL.D., Author of "History of the War of 1812," &c. Philadelphia: Porter & Coates. London: Sampson Low & Co. 1877.

‡ *An Introduction to the Reports of the Commissioners of the United States to the Vienna Exhibition of 1873.* Washington: Government Printing Office. London: Trübner & Co. 1876.

§ *Familiar Letters of John Adams and his Wife Abigail Adams during the Revolution; with a Memoir of Mrs. Adams.* By Charles Francis Adams. New York: Hurd & Houghton. London: Trübner & Co. 1877.

* *Report upon Geographical and Geological Explorations and Surveys West of the 100th Meridian.* Vol. V.—Zoology. Washington: Government Printing Office. London: Trübner & Co. 1875.

Puritan preachers and demagogues of Boston, but a political leader, a man of education and experience in public affairs like Mr. Adams, speaking of all opponents, whether in the council or the field, in terms of virulent abuse and invective, and see the writer, even in private letters, displaying an utter incapacity to do justice to the character, the situation, and the duties of any man engaged in the official or military service of the Crown, we cannot wonder that every attempt at negotiation was misinterpreted and misunderstood, and that the best-meant efforts at reconciliation were received with a determined prejudice which rendered them utterly hopeless. On one point the letters may perhaps help to correct certain false impressions prevalent among the grandsons and great-grandsons of the revolutionary soldiers. The havoc committed by the English troops and the mercenaries employed by the British Government, which in nowise exceeded the usual severities of war at that period, has been preposterously exaggerated by American historians; while they have slurried over the records of the far worse havoc and the brutal indignities inflicted by the revolutionists on that large section of the American people who loyally adhered as long as possible to their Sovereign; cruelties which of course would have justified the sharpest reprisals on the part of the English commanders. Mr. Adams is no more just or reasonable on this subject than his contemporaries or successors; but he does here and there let fall some accidental evidence as to the facts of the case which may serve to correct the misconceptions too prevalent among those who derive their notions of revolutionary heroism and British cruelty from American school histories.

Mr. Whittaker's *Life of General Custer** is full of interest; it is a vigorous and graphic account of a brief but brilliant military career, beginning with the commencement of one of the greatest wars of the age, and closing, unhappily, in one of the many signal disasters of that petty Indian warfare which does so little credit to the Federal Government and army. Mr. Custer was a cadet at West Point when the Civil War broke out, and with the rest of his class was promoted to a lieutenancy as soon as it was possible to hurry them through a formal graduation. He had the good fortune to be immediately appointed to one of the finest regiments of the regular army, the 2nd Cavalry, of which, if we rightly recollect its story, Sidney Johnstone was the Colonel and General Lee the Lieutenant-Colonel; and from which were taken many of the best commanders both of the North and the South. General Custer was confronted with many, not only of those who would a year earlier have been his brother officers, but of his own actual class-mates. The Federal army was so deficient in competent and trained officers that it offered splendid opportunities of rapid promotion even to the youngest of those who had received a regular military education. It is true that the way was blocked by multitudes of untrained men placed in high commands for purely political reasons, or often by influences exerted through the lowest channels of underhand patronage; and several of these continued to hold to the very last posts for which they had proved themselves signally unfitted. But many among them were so clearly incompetent even for the ordinary duties of regimental and company command, and so disgraced themselves by their conduct in the camp and the field, that when it became evident that Mr. Seward's "three months' drafts" were to be dishonoured, and that the war was to be a long and serious one, public opinion and military necessities compelled Mr. Lincoln and his advisers to get rid of them by wholesale; and their places were filled in great measure by young men like Custer from the lowest grade in the regular army. The young Lieutenant of the 2nd Cavalry was among those Northern officers who first showed striking capacity for efficient action in that special branch of the army in which, at first, the South so greatly excelled its antagonist. Contrary to the unanimous judgment of foreign, and of most native, writers, Mr. Whittaker claims for the Northern cavalry under Sheridan's command superiority to that of the South upon this very point; and there is no doubt that even the Southerners, as might have been expected of comparatively untrained men and horses, were never equal in the proper duties of heavy cavalry, and in the use of the sabre, to European mounted troops. But we believe that the saying which describes Stewart as the one great cavalry leader and Sheridan as the greatest dragoon general that the war had produced was essentially correct; and though Custer, no doubt, led several brilliant charges in which good use was made of the sword at close quarters, his exploits in this respect were altogether exceptional. Mr. Whittaker commits another error, common to the great majority of Northern writers, in persistently misrepresenting the respective numbers of the combatants in nearly every engagement. Wherever trustworthy accounts of the Confederate forces are to be obtained, it is found that on nearly every occasion on which the Northern troops maintained the conflict with credit they outnumbered the enemy by fifty or a hundred per cent., whereas Mr. Whittaker almost always represents the conflicting armies as tolerably equal in strength. He has, however, the rare merit of speaking with decent courtesy of the Confederates generally, and of showing a just appreciation of the high qualities of many of their individual leaders. It is only when he comes to speak of General Custer's rivals and superiors in his own service that he displays the partiality and intemperance which are the characteristic *lure* of biographers; and this disease breaks out with particular virulence in his account of the operations which led to

General Custer's defeat and death. But, putting aside the defects, less of candour than of tamper and judgment, which it displays, the whole narrative is eminently lively and readable. Its descriptions of military movements are clear and graphic, and few of the multitude of military biographies to which the war has given rise can be read with so much enjoyment and so little annoyance.

A treatise on *Gold and Debt**, by Mr. W. L. Fawcett, contains in no great bulk a large amount of valuable statistical and practical information regarding the history of American finance since the outbreak of the Civil War. The writer's views, so far as he states them, are often questionable, though he is much more often wrong from a complete misapprehension of the practical meaning of the expressions employed by the writers whom he criticizes than from actual divergence from their opinions. That the depreciation of silver, for example, during the last year was due in great part to its demonetization in Germany and Scandinavia, and to the limitation of the silver coinage in the Latin States, no one would altogether deny. That something may be ascribed to the increased demand for gold owing to the same cause, would hardly be questioned; and where Mr. Fawcett thinks that he differs entirely from nearly all previous writers on the subject, the only real diversity of view appears to lie in this, that he supposes at least one-half of the nominal depreciation of silver to have been due to the increased value of gold, whereas our Indian experience sufficiently proved that silver had fallen in value almost to the full extent of the nominal depreciation, not only as compared with gold, but in general purchasing power. The greater part of the work, however, is occupied with statements of fact, some of them a little distorted, owing to the confused ideas of the author upon one or two economical questions, but generally correct and very valuable. He shows that the debt of the United States had reached at its highest point somewhat more than 2,600,000,000 of dollars, and has now diminished by about 500,000,000, while the interest has in the same time fallen by about 46,000,000. He supposes that the amount of American debt, State, Local, and Federal, held in Europe, reaches 1,350,000,000 of dollars. This statement may not be accurate, but the inferences by which it is reached are given, and the reader may form for himself a pretty fair conclusion as to the soundness of the argument.

A much less sound and useful treatise is that of Mr. Dillaye on *Assignats*†, in which he endeavors to prove that, despite the signal example of the ultimate tendency of paper currency to utter worthlessness, which is afforded by revolutionary France, paper money is as sound and trustworthy as gold, and a paper currency much more conducive to popular welfare and just relations between capital and labour than a metallic one. Against Sir Robert Peel, and all who think that a piece of money should represent a certain weight of precious metal of a certain fineness, the writer indulges in what is rather to be called raving than invective; while he is ignorant enough to fancy that the Bank Act, after having cost us, as he informs us, 3,000,000,000 dollars in three years, has been denounced, condemned, and abandoned. The utter depreciation of assignats he imputes, not to its true cause—the enormous over-issue of a paper currency intrinsically worthless, and therefore capable of maintaining a nominal value only while its amount was restricted within narrow limits—but to the political violence of the revolutionary party, and still more to the malignant policy of their opponents. The actual incidents to which he ascribes the rapid discredit of the assignats are, even on his own showing, so ridiculously trivial that liability to be depreciated by such causes would in itself suffice, in the eyes of any one but the author, to condemn a paper currency. For what reasons the Continental currency of 1777 became almost as worthless as the French assignats he fails to explain. Nor does he seem to understand how rare and accidental is the prudence which, by confining the issue of greenbacks to very little more than the quantity of coin previously circulating in the country, has rendered the present paper currency of America comparatively safe. Of that numerous class of currency-mongers who are the circle-squarers of finance, wild and violent as their writings generally are, we remember none more intemperate in invective, or more thoroughly extravagant in opinion, than Mr. Stephen Dillaye.

Such value as may belong to Dr. Dunham's *Theory of Medical Science*‡ depends on a consideration which probably would destroy the author's self-satisfaction in his work—namely, that it by no means contradicts so forcibly as he imagines the general doctrine of enlightened physiologists and physicians, however it may correct some of their less accurate modes of expression. That medicines act of themselves directly on disease, expelling noxious elements from the body, or otherwise exerting a curative force independent of the vital functions, is the doctrine which he ascribes to the medical world at large. That medicine and all external or artificial agencies can operate only by provoking or stimulating to action the vital powers themselves is, as he supposes, a new theory; his illustrations of which are often interesting, and may perhaps be useful, even if the idea itself is as little contrary to the general belief of scientific men as it is to those ideas derived from their writings which have become familiar to educated men in general.

* *Gold and Debt: an American Handbook of Finance, and Digest of the Monetary Laws of the United States.* By W. L. Fawcett. Chicago: Griggs & Co. London: Trübner & Co. 1877.

† *Assignats and Mandats: a True History.* By Stephen D. Dillaye. Philadelphia: Carey Baird & Co. London: Trübner & Co. 1877.

‡ *Theory of Medical Science.* By William R. Dunham, M.D. Boston: James Campbell. London: Trübner & Co. 1876.

* *A Complete Life of General G. A. Custer.* By Frederic Whittaker. New York: Sheldon & Co. London: Sampson Low & Co. 1877.

Under the title of the *Paradise of Childhood**, we have a very elaborate description of the method of teaching some of the rudiments of knowledge in those peculiar schools called Kindergarten. The system, as explained in this volume, begins with the use of a number of cubes so divided, added, and arranged as to give without much difficulty, even to the youngest children, elementary notions of form and number. By means of a variety of cubes, and afterwards of blocks or sticks, so called, of other simple forms, the infants are instructed first in general ideas respecting the objects of common life, the construction of houses, chairs, &c., and afterwards in the elements of drawing. It is easy to believe that the method may be, to some extent, both agreeable and successful; but whether either the substance or the amount of the teaching be equally satisfactory, whether much would be learned in this manner that can be said to form an essential part of education or to diminish the subsequent labour of its necessary portions—whether, in fact, a child educated for two or three years on this method will learn to read, write, and cipher more quickly or easily than one who comes altogether fresh to the task—seems by no means certain.

We have on our list two technical works in different departments—one on elementary mechanics†, by Mr. Wood, and one on Qualitative Chemical Analysis‡, giving a detailed description of the ordinary reactions of different classes of substances divided into four groups of metals, and one of known metals and acids, by Professors Douglas and Prescott, both teachers of chemistry in the University of Michigan.

A series of sermons on the Two Great Commandments§ would not ordinarily fall under our notice in these columns; but the author has chosen to deal with topics which do not usually come within the scope of pulpit oratory—those, namely, which belong to the science properly called casuistry; a science of more value than is popularly supposed, and deserving of more study than, owing to the prejudice attached to its name, it has of late years received. Had Mr. Dewey seriously studied this subject, instead of imbibing and making himself the mouthpiece of vulgar prejudices on the subject, he would hardly have argued, or rather affirmed, the absolute unlawfulness of lying in all possible cases; carrying his doctrine to the utmost logical extreme, and thereby, in the opinion of most men of sense, reducing it to an absurdity, as when he virtually asserts that it is a duty to tell the truth even when to do so is practically to give information to assassins, and to become an accomplice in murder.

A treatise on American Dairying|| includes discussions on the choice of dairy stock, on the best methods of feeding, of construction of barns and dairies, the rearing of calves, the character and quality of milk, cream, butter, and cheese as affected by the food and treatment of the animals, and by the subsequent management of the products themselves.

Mr. Rand's treatise on the culture of orchids¶ will find a somewhat limited, though no doubt an attentive and interested, public. The finer specimens of orchids are seldom natives of temperate climates. They require extreme care and close attention when reared in hot-houses, and the variety of their characters, and of the treatment necessary to their successful growth under artificial conditions, are such that only rich men can afford, and only enthusiastic florists will care to attempt, their cultivation. The few who can and will build, maintain, and stock orchid-houses with the choicest productions of tropical and semi-tropical climates will find in this volume minute instructions respecting both the general management of the genus and the details of treatment required by almost every separate species.

Mr. Martin Tupper is well known as an English author. In the volume before us** he appears as an American writer both in choice of subject and in place of publication. The poem, which he publishes before reading it in public during his visit to America, is a eulogy of Washington in the form of a play, in which he justifies, nay eulogizes, the worst of Washington's acts—the execution of André; and not merely justifies it, but vituperates the unfortunate victim in terms of which Washington himself would have been ashamed. To give to this absurd little piece the interest which love is supposed to afford to the dullest and which is thought essential even to the most exciting themes, he supposes André to be in love with the sister of the traitor Arnold, and makes her attempt to revenge her lover's death by the murder of Washington. The execution of the work is worthy of the conception and of the past achievements of the writer. Another

little volume of poetry of higher merit (though this is not saying much) is a translation of Grillparzer's tragedy of *Sappho* by Miss Frothingham*, not devoid either of power or elegance, but bearing signs of the constraint and want of freedom which are apt to embarrass first attempts at verse translation even by writers thoroughly familiar with both the languages they have to handle. We have also two more volumes of Messrs. Osgood's series of *Poems of Places*†. The pieces in this collection, translated and original, relate to places in France noted either for beauty of scenery or for their connexion with historic incidents. The same publishers have issued a very neat pocket edition of Mr. Harte's little novel entitled *Thankful Blossom*‡, a story of revolutionary times, in which Washington figures as a principal character.

* *Sappho: a Tragedy in Five Acts*. By Franz Grillparzer. Translated by Ellen Frothingham. Boston: Roberts Brothers. London: Sampson Low & Co. 1876.

† *Poems of Places, France*. Edited by Henry W. Longfellow. 2 vols. Boston: Osgood & Co. London: Trübner & Co.

‡ *Thankful Blossom: a Romance of the Jersey, 1779*. By Bret Harte. Illustrated. Boston: Osgood & Co. London: Trübner & Co. 1877.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE UNITED STATES.

The Annual Subscription to the SATURDAY REVIEW, including postage to any part of the United States, is £1 10s. 4d., or \$7 5s. gold, and may be forwarded direct to the Publisher, Mr. DAVID JONES, at the Office, 38 Southampton Street, Strand, or to Mr. B. F. SILVERMAN, American Agency, 4 Trafalgar Square, London. International Money Orders can be sent from any office in the United States, and Subscriptions, payable in advance, may commence at any time.

PARIS.

Copies of the SATURDAY REVIEW may be obtained every Saturday of M. FOTHERINGHAM, 8 Rue Neuve des Capucines.

The SATURDAY REVIEW is duly registered for transmission abroad.

The publication of the SATURDAY REVIEW takes place on Saturday Mornings, in time for the early trains, and copies may be obtained in the Country, through any Newsagent, on the day of publication.

PRINCE BISMARCK.

THE retirement of Prince BISMARCK from the supreme direction of public affairs in Prussia and Germany has taken by surprise his countrymen and Europe. In the plenitude of his power, the first statesman in Europe, the creator of the Empire, the seeming arbiter of the fates of many nations, has suddenly struck work. He announces that he prefers and needs the quiet of private life, and leaves the world to go on as it can without him. He says he is ill, and an inquisitive and sceptical public asks why he should be ill? The answer probably is the very simple one that he really is ill. The prolonged strain to which he has been subjected has at last proved too much for him. He has long been suffering, and he has chosen the date of his sixty-third birthday to confess that he is not so young as he was. Too much excitement, anxiety, and responsibility, daily conflicts and daily perils, have worn him out, although his natural strength is far beyond that of the average of mankind. It has for some time been no secret that he would have before long to choose between death and retirement, and he has chosen to retire, to the disappointment of many alike of his friends and enemies, who held, for different reasons, that he was bound to die at his post. But it is not unnatural that he should have thought that he could do his country better service if he lived on to be ready if any great emergency should require his reappearance. He will be sure to be found willing to help if he is really wanted, and the mere fact that he may at any day resume his high position, and that he is watching what Germany is doing at home and abroad, will exercise a constant influence on the policy which his countrymen adopt. No tribute to his eminence could be more striking than that implied in the profound indifference with which the names of those appointed to succeed him in his different offices have been received. If WELLINGTON had been killed at Waterloo, it would not have seemed a matter of much moment which of his generals had taken over his command. Fortunately the great captain of German statesmanship has not been killed but only wounded, and his successors will know that they are conducting their operations under the superintendence of his vigilant criticism. Even while he seems to be doing nothing, saying nothing, and inspiring no one, his influence will remain as long as he lives, and it would have been a great loss to his country if he had shortened his life merely that for a little while longer his influence might be direct instead of indirect. Germany with Prince BISMARCK in retirement is a much greater Power in every way than it would be with Prince BISMARCK dead. Possibly a temporary rest may recruit his health, and he may in the course of time be willing to resume his ordinary work. But this cannot be confidently expected. His need of rest is so imperative, and his nerves and general health have been so much shattered, that it is not likely that he will readily seek again the burden of office in quiet times; and it may be presumed that it will be only when storms are threatening or raging that he will henceforth consent to pilot the labouring State.

The domestic affairs of Germany are passing through a stage which at once accounts for Prince BISMARCK's wish to retire and justifies the step he has taken. The great lines of the Empire have been laid. The indispensable conditions of coherence have been accepted by or forced on the minor States. Prince BISMARCK has had his way in regulating the relations of Church and State.

The military organization, the coinage, the criminal code of united Germany have been fashioned to his satisfaction. But after the day of great things the day of small things inevitably comes. Although the larger elements of a settlement are accepted, conflicts over details arise. The real union of Germany into a whole, the existence of which is recognized in all the trifles of ordinary life, must be the work, not of one man or of a few years, but of at least a generation. The Germans who are now called on to work the Imperial system have grown up with all the traditions, feelings, and prejudices of members of particular States, and they incline to walk in their old grooves so far as they think they can do so without bringing the Empire to destruction. They find a pleasure in thwarting Prince BISMARCK in little things. Prussian officials trained in the belief that each department is solely responsible to the Sovereign do not bend easily to the theories of Parliamentary government. Those who have been accustomed to work the railways in the minor States are pleased when they can put obstacles in the way of a man who desires that all railways should be worked so as to serve the purposes of the Empire. Germans, too, are necessarily deficient in political education, and many of them are easily induced to shut their eyes to the dangers of Socialism or the fallacies of Protection. To keep his countrymen straight, Prince BISMARCK has to be always at them, hammering, fighting, arguing, and not unrequently bullying, so that he may guide them right in matters each of which seems separately of no great importance. He is like a man who has fashioned for himself a fine park, and then finds he has to pass his life in spudding thistles. This is wearisome work, and the weariness of a kind peculiarly trying to a man whose over-exertion has made nervous and excitable. However hard he worked, he could not in this direction bring his work to an end. In the details of domestic politics the Germans must some day be left to take their own course, and blunder on as well as they are able. Prince BISMARCK may fairly say that the time is now come when he may leave them to themselves; and if the mistakes they make are very serious, they will be sure, he may think, to come to him to help them out of their difficulties.

It certainly, however, might have seemed that the present was scarcely a moment when the general situation of Europe would have permitted him to think that he could be well spared. There are so many threatening symptoms, and a war to which Germany could not be indifferent appears sometimes so near, that it seems wonderful that Prince BISMARCK should think this a fit opportunity for enjoying a year of leisure and travel. Any explanation of his motives must be mere guesswork. No one outside a very small circle of intimate confidants, and very possibly no one at all, knows what is the real view of Prince BISMARCK as to the present situation of Europe. We can only discuss probabilities; and of all solutions of his retirement the most improbable seems to be that he has long been trying to decoy Russia into a war which he knows must ruin her, and that he now finds he must give way, and leave his wise and honest old master to explain to the CZAR, and to ignorant persons like Prince GORTCHAKOFF, the real truth as to the prospects and position of Russia. If anything can be considered certain in current history, it is that the CZAR finds himself on the verge of war, not because he listened to the wily counsels of Prince BISMARCK, but because he shared the enthusiasm of his people, and wished to pursue the traditional policy of his country. Far from urging Russia to its ruin, Prince

BISMARCK, on the single occasion on which he has spoken publicly of the Eastern question, uttered a solemn warning to Russia that she would have to reckon with Germany if she pushed too far on the dangerous path of conquest. It is equally difficult to believe that Prince BISMARCK now retires because he sees no chance of finding a pretext for a wicked and indefensible attack on France. Prince BISMARCK exacted very hard terms from France, and has perpetually reminded his countrymen that they must be always armed and always on the alert if they wish to retain what they won. But he has steadily maintained that the true policy of Germany must be a defensive one, and his influence has always been used in the direction of moderating the impatience of the military caste in Germany. Some French critics have expressed a satisfaction at the thought that Prince BISMARCK will no longer inspire the foreign policy of Germany, as they think that his retirement is a guarantee of continued peace between Germany and France. They may be thankful if they do not come to see how much they are mistaken, and do not experience how much more unpleasant it will be for France to have to deal with the military caste in Germany, when Prince BISMARCK is no longer at hand to repress its arrogance and allay its irritation. Perhaps the simplest and most probable explanation of his retirement is that he does not see anything touching very closely the interests of Germany in the present state of European affairs. He leaves Germany on excellent terms with England, Austria, and Italy; he leaves it with no overt or immediate signs of hostility to France; and he has kept his countrymen quite clear of any direct connexion with the settlement of Turkey. If Russia does not go to war, the crisis is over for the present; and if Russia does go to war, he has secured, so far as such a point can be secured, that Russia will not do anything to wound the susceptibilities or imperil the interests of Germany. It may therefore seem to him that there is nothing very particular for him to say or do just now, and that, if rest is necessary for his health, he is as free to take it as he could ever hope to be.

THE PROTOCOL.

THE publication of the Protocol and the official correspondence relating to it will sufficiently explain the difficulties which for a time delayed an agreement on the subject. They were at last overcome by an understanding that England should not be bound by any agreement if Russia eventually failed to disarm. The Protocol sets forth in substance that the Powers who have signed it take cognizance of the conclusion of peace with Servia; that, as to Montenegro, they consider the rectification of the frontier and the free navigation of the Bojana desirable; that they regard the arrangements between the Porte and the two Principalities as a step towards pacification; and that, recognizing the good intentions of the Porte with regard to the Christian populations and its evident interest to carry them into effect, they invite that Government to place its armies on a peace footing. It is intimated also that the Powers propose to watch carefully, by means of their representatives at Constantinople and their local agents, the manner in which the promised reforms of the Ottoman Government are carried into effect, and that, if their hopes should once more be disappointed, they reserve to themselves to consider in common the best means of securing the well-being of the Christian populations and the interests of the general peace. A Russian declaration is appended, to the effect that, if peace is concluded with Montenegro, and the reforms promised by Turkey are seriously undertaken, the EMPEROR will consent to treat as to disarmament; and there is also a declaration by Lord DERBY that, in default of reciprocal disarmament, the Protocol will be deemed null and void. It is not surprising that political critics in England and in Russia are inclined to disparage a compact by which neither party is absolutely bound. The Russian AMBASSADOR, indeed, declared before the signature of the Protocol that his Government wished to demobilize the army; but he added the limitation that Turkey must not only agree to disarm simultaneously, but must make peace with Montenegro and prevent the occurrence of fresh outrages. The AMBASSADOR'S words have been recorded in the official account of the proceedings; but they were not in the first instance reduced to writing. The negotiators may not have intended to express mutual suspicion; but they were anxious to guard themselves

by every imaginable reservation. The general object was to establish some ostensible concert, and at the same time to concede none of the conflicting principles which it had previously been found difficult to reconcile. Four of the Great Powers have throughout the discussion kept themselves in the background, either through deference to Russia, or because they placed confidence in the firmness and perspicacity of the English Government. It is not the first time that the same onerous compliment has been paid to a Government which is supposed not to shrink from the duty of plain speaking. Fourteen or fifteen years ago, when NAPOLEON III. proposed a Congress on the general affairs of Europe, the Continental Powers, although none of them approved of the proposal, returned a guarded assent, leaving Lord JOHN RUSSELL to incur the anger of the French EMPEROR by demonstrating in a vigorous despatch the absurdity of the entire project. At the present time no Government is disposed either to aid Russia in the coercion of Turkey, or unnecessarily to recognize the right of Russia to interfere; but England alone has openly maintained the validity of the Treaty of Paris, and has steadily resisted the Russian pretensions. The Protocol appears to include an engagement on the part of the signatory Powers to adopt such means as may be deemed expedient for inducing the Porte to perform the promises of improved administration which have been repeatedly made. If Russia fails to disarm within a reasonable time, England will not even be bound to adopt any means for the accomplishment of the common object. It seems impossible to promise less, if the document is to include any kind of undertaking.

Notwithstanding the vagueness of the Protocol, there is some reason to hope that it may serve its purpose. The signatures affixed to the diplomatic agreement are its most important part. A rupture of the negotiations would almost certainly have been followed by an advance of the Russian army, and it may be supposed that an amicable arrangement ought to produce the opposite result. The Russian journals were at first allowed or instructed to announce that their Government had obtained a great diplomatic victory; nor would it have been desirable to disturb an illusion which was apparently designed to reconcile public opinion to the abandonment of armed intervention. Within a few days the journals once more assumed a warlike tone, the Ministers having perhaps discovered that their original statements were not implicitly believed. If the Turkish Government prudently makes concessions to Montenegro, and gives assurances of its intention to disarm, the Russian Government may perhaps persuade its subjects that the object of the threatened war has been obtained without actual collision. The most disquieting symptoms consist in the alleged continuance of military preparations; but it is satisfactory to know that there are no independent newspaper Correspondents at the headquarters of the army, and that all reports and rumours are exclusively official. It is at least possible that reinforcements, railway arrangements, and plans of campaign may have been announced for political reasons with little reference to actual occurrences. When the numbers of an army expand suddenly from 250,000 to 400,000, it may be allowable to receive with a sceptical reserve information directly or indirectly furnished by the Government. It is much more certain that General IGNATIEFF was sent to the European capitals on a diplomatic mission than that the Archduke NICHOLAS has received orders to cross the Pruth at the beginning of May. If it is true that the EMPEROR ALEXANDER intends to reward his confidential Envoy by a high titular distinction, there will be additional reason for supposing that the Russian Government intends to maintain peace. Now, as at all former times, the decision rests with the EMPEROR alone, although he may think it desirable to satisfy the judgment of his subjects, who will in any case accept his policy.

If the odd arrangement with which the negotiations ended had not been patched up, the IGNATIEFF mission might have been explained by a desire on the part of Russia to place the EMPEROR'S pacific wishes on record at the beginning of the war. The Russian Government might have plausibly objected to the ingenious device by which Lord DERBY evaded the apparent necessity of insisting on disarmament. As the compromise was finally adopted, some contingency to which it was applicable must have been contemplated by Russia. Disarmament, which will not be of right demanded by the other parties to the Protocol, will subject them to the obligations, if any,

which have been hypothetically incurred. War, on the other hand, would invalidate the result of so many negotiations. It is perfectly true that Russia has given no formal undertaking to abandon, or even to postpone, her invasion of Turkey; but a warlike policy would be more offensive to Europe since the signature of an agreement which was evidently designed as an instrument for maintaining peace. Those who have taken the trouble to construct a bridge for the Russian retreat would be entitled to complain of the waste of their labour if the bridge were not used for its destined purpose. If the army in Bessarabia is dispersed, it will not be expedient to dilate on the vacillations of Russian policy. The reasons for peace are obvious and cogent; but it is plain that some time since they were not thought conclusive. A year ago Lord DERBY incautiously asserted that the financial condition of Russia was a security for peace. It is possible that economical considerations may have contributed to the ultimate decision of the Russian Government; but experience shows that great Powers are seldom deterred from war by pecuniary difficulties. A stronger reason for moderation has probably been furnished by the impossibility of obtaining from the Great Powers an assurance of eventual neutrality. Austria especially has throughout reserved freedom of action; and at the beginning of the session of the German Parliament Prince BISMARCK significantly intimated that in certain contingencies Germany would come to the assistance of Austria. It is not to be supposed that the Turkish armaments influenced in any considerable degree the policy of Russia. The only consequence of a declaration of war which could be regarded as certain was the success of the Russian army against the Turks.

Those who have taken an active part in advocating the claims of the Christian subjects of the SULTAN have some reason for the dissatisfaction which they express at the result of the negotiation with Russia. The English Government has perhaps accomplished the object which it proposed to itself of preventing or adjourning a rupture between Russia and Turkey; but it has not obtained; nor since the failure of the Conference demanded, any concession from the Porte. In the course of the late discussion the Government constantly repudiated any purpose of coercion; and consequently it can only rely on friendly influence for the adoption of any advice which it may offer to the SULTAN and his Ministers. It is fully ascertained that the neutrality of the English Government is approved by Parliament; but the minority has a plausible case for complaining that there is no security against the continuance of chronic misgovernment, or even against the possible recurrence of such atrocities as those which were perpetrated last year in Bulgaria. Many expressions of Lord DERBY, Sir STAFFORD NORTHCOTE, and other Ministers may be quoted as admissions that the oppressed Christians are entitled not only to compassion, but to some kind of protection; and it is perfectly true that any express or implied promise of aid which may have been given has not been fulfilled. It may not be possible to vindicate the absolute consistency of the Government; and perhaps it would have been prudent to withhold vague pledges which could only be redeemed by a policy of coercion. There can be little doubt that Lord DERBY will apply to the Porte all the moral pressure which he may have the means of exercising; and the influence of England, which had been previously impaired, ought to be revived by the great service which will have been rendered to Turkey if diplomacy has succeeded in averting a Russian invasion. It is possible that the Turks themselves may at last have become convinced that their only chance of preserving their national existence is to abate some of the grosser evils of their system of government. Even the anomalous and paradoxical Parliament may possibly be turned to some practical use, as some of the members appear to construe liberally the powers and immunities which are secured to the Assembly on paper. It will be strange if an institution plagiarized from countries in a different stage of civilization should find a congenial soil in Turkey. A well-paid and impartial police force would offer a better chance of improvement.

THE COMING BUDGET.

IT is now known that the anticipations of the CHANCELLOR of the EXCHEQUER will be almost exactly confirmed by the result. The equilibrium between last year's estimates

and the actual receipts and expenditure is due to a casual increase of miscellaneous revenue; but the deficiency would in any case have been fractional. It was undoubtedly prudent to assume that the ordinary income of the last year would be the same with that of the year before. As trade has not yet emerged from its long stagnation, the revenue derived from consumption might have been expected to decline; but the increase of population, and the maintenance in almost all branches of industry of the high rate of wages which had been established in more prosperous times, has prevented any considerable diminution of receipts from the Customs and the Excise. The actual proceeds of the additional penny of Income-tax must depend in some degree on the completeness of collection. The increase in the produce of the tax during the year is less than 1,200,000*l.*, while, at the former rate, each penny produced a million and a half. The large reductions and exemptions by which Sir STAFFORD NORTHCOTE guarded against popular agitation account for a part, but probably not for the whole, of the diminished return. Arrears now outstanding will be credited to next year's estimates, with the result of producing a slight increase as compared with the corresponding item in the last Budget. The estimates of expenditure will be nearly the same with those of last year; but Sir STAFFORD NORTHCOTE's Sinking Fund will now be brought for the first time into full operation, involving an additional charge for the present and future years of 300,000*l.* It is not to be supposed that either the CHANCELLOR of the EXCHEQUER or the House of Commons will divert the fund from its destined application within two years from the first adoption of the plan, and in a season of no extraordinary financial pressure. All parties are verbally pledged to a partial reduction of the debt; and Sir STAFFORD NORTHCOTE's scheme is cheaper and simpler than the practice of creating terminable annuities. Altogether, it will be necessary to provide nearly 80,000,000*l.* for the public service; nor is the expenditure unreasonable as compared with the outlay of twenty, thirty, or forty years ago. Warlike stores, the cost of naval construction, and the wages of soldiers and sailors have largely risen; and a large addition to the civil functions of Government has necessarily produced increased expense. A part of the addition to the expenditure of a former generation is merely a matter of account. About five-and-twenty years ago Mr. GLADSTONE introduced the rule of including in the annual outlay the cost of collecting the revenue.

It may be hoped that the CHANCELLOR of the EXCHEQUER will adopt the simple course of making no financial change during the present year. He will be justified, notwithstanding the unsatisfactory results of the autumn and winter quarters, in calculating on the same revenue which he last year expected and received. Although industry is still stagnant, there are some symptoms of an approaching revival of commercial activity; for the first time in many months the rate of interest in the open market is the same with that of the Bank of England, and the increased demand is apparently due to legitimate causes. The returns of railway traffic during the early spring show a slight advance as compared with the corresponding season of last year, and some trades are in a tolerably flourishing condition. Two years have elapsed since the events which were followed by the exposures of the Foreign Loans Committee, and more than a year since the ruinous losses incurred by Turkish bondholders. No similar cause of distress has arisen during 1876; and there has never been a time in which the more hazardous kinds of speculation have been more generally suspended. There are objections to financial schemes which leave even a remote chance of deficiency; but the CHANCELLOR of the EXCHEQUER will have to balance the disadvantages of a narrow or vanishing margin of revenue over expenditure against the great and immediate mischief of increased taxation. The suggestion of an addition to the spirit duties is not likely to be adopted. A change in the rate of duties on articles of consumption which is intended to be only temporary involves great inconvenience to manufacturers and traders. It is difficult to estimate the effect of an increased tax on consumption; and the negotiations relating to the French Commercial Treaty might perhaps be embarrassed by an increased Customs duty on spirits, although a corresponding addition would be necessarily made to the Excise. There seems to be no other indirect tax which could be increased without great inconvenience.

There remains the almost defenceless victim of modern

financiers, the unfortunate payer of Income-tax. Sir STAFFORD NORTHGOTE was perhaps unduly blamed for the inequalities which he introduced into the assessment of the tax when he last year increased the amount. There was no doubt that the poorer contributors, while they bore but an equal share of the direct impost, paid more than their proportional share of Excise and Customs duties. It was also just to extend to the lower section of the middle class an exemption which had, in spite of the law, been practically asserted by artisans. The principle of partial relief had been recognized from the time of Sir ROBERT PEELE to the present day; and it was justly remarked that a moderate extension of apparent anomalies could scarcely amount to revolutionary confiscation. There is no doubt that the CHANCELLOR of the EXCHEQUER has in his official capacity profited largely by his conciliation of a class which included the most troublesome section of taxpayers. The small tradesmen who responded to the appeals of agitators have been silenced; and the great majority of borough voters have no interest in the percentage which may be levied on income. The surviving contributors to the Income-tax have a strong moral claim on the forbearance of the Minister who has relieved himself from the clamorous remonstrances of their neighbours. They had simultaneously to bear an addition of fifty per cent. to their own burdens; and they are now waiting with anxiety to learn whether the increase may not be doubled. A Chancellor of the Exchequer is unavoidably compelled to disregard exact symmetry of taxation; but he is at the same time bound to remember that the Income-tax becomes more unequal as often as it varies in amount. If the charge could have been permanently maintained at the moderate rate to which it had been judiciously reduced by Mr. LOWE, the recipient of an income worth a year's purchase would in course of time have paid precisely the same relative amount with the landowner or the freeholder. An addition which is imposed for a short time weighs unjustly on the trader or professional man whose income may perhaps only coincide in duration with the tax. Another reason against an increase is that the proportionate productiveness of the tax varies inversely with the rate.

There is no reason to regret the practical concentration of responsibility on the CHANCELLOR of the EXCHEQUER. When the Prime Minister happens, like Sir R. PEELE or Mr. GLADSTONE, to possess great financial authority, he may, if he thinks fit, take part in the arrangement of a Budget; but Mr. GLADSTONE himself seemed not to interfere habitually with the projects of Mr. LOWE, and Lord BEACONSFIELD would certainly not think of overruling the plans of Sir STAFFORD NORTHGOTE. The CHANCELLOR of the EXCHEQUER may count as confidently on the support of the House of Commons as on the assent of his colleagues; but his friends are more directly interested than his opponents in his avoidance of an unpalatable increase of taxation. If, indeed, an addition to the Income-tax were indispensable to the national credit or the public service, the Government which proposed the measure would incur no risk of defeat; but the popularity of the Ministers out of doors has lately been compromised, and it will be desirable to avoid causes of irritation. The conclusion of the late tedious negotiation may perhaps justify a more cheerful view of commercial and financial prospects. Although the connexion between cause and effect may be open to question, the depression of trade has been often attributed to the prospect of political complications. It is true that the stagnation prevails in the United States, which are exempt from the risks of European diplomacy and ambition, as well as in Germany, which has ostentatiously professed indifference to the Eastern question. The influence of menaces or probabilities of war has perhaps been exaggerated; but it may not have been wholly imaginary. Not long since the Russian Government formally assigned as one of its possible reasons for invading Turkey the uncertainty which had, as it was said, for some time paralysed industry. On the whole, it may be expected that the CHANCELLOR of the EXCHEQUER will make a short speech, and introduce an unambitious Budget. It will not be difficult to explain to the satisfaction of the House of Commons that there is no surplus, no deficiency, no opportunity of affording relief, and no necessity of imposing new burdens on the community.

INDIAN FRONTIER POLICY.

IN his recent speech in the Legislative Council Lord LYTTON takes credit to himself for telling the public the truth about important questions in which they are legitimately interested. If this is to be the uniform note of the VICEROY's Parliamentary efforts, it is difficult not to feel some alarm at the possible consequences of such unwonted frankness. There are two considerations which suggest a doubt as to the prudence of taking the public into his confidence. One relates to the character of the public which is thus favoured; the other to the position of the personage who thus favours it. Lord LYTTON does not exaggerate the ignorance and liability to error of the Indian press; but, as regards the native portion of it at all events, he attributes to it a capacity of being influenced by the truth when it is known which is altogether imaginary. The wisdom of taking every opportunity of winning confidence by showing confidence greatly depends on the probability that there is any confidence to be won. A well-disposed press which is expected daily to criticize a policy and action which are unknown to it will doubtless benefit by the removal of its ignorance. But an ill-disposed press will merely have the nature of its work a little changed. Hitherto it has invented a policy in order to condemn it. Under Lord LYTTON it will distort a policy in order to condemn it, and the latter process is on the whole the more mischievous of the two. Nor is the Viceroy of India in the position of a Parliamentary Minister. He is the chief of a powerful Executive, and of an Executive whose usefulness depends in a great measure upon its ability to impress its subjects with an adequate idea of its strength. The spectacle of the Viceroy appealing for the support, first of the Legislative Council, and next of the Indian press, is not calculated to further this end. To invite criticism which you do not mean to regard unless it square with your own opinion is more likely to irritate the critic than to conciliate them.

For once, however, Lord LYTTON's plain speaking promises to be of some use. As regards the Indian public the best thing that can be hoped for is that it should be forgotten. But as regards the English public the case is different. A great part of Lord LYTTON's speech is devoted to an exposition of Indian frontier policy, and this is very much too important a matter to be usefully decided without reference to Parliament. As a rule, the practice of constituting the House of Commons a court of appeal from the decrees of the Indian Government is not one to be commended. It is seldom that the House takes any interest in the controversy, and on the rare occasions when it can be made to do so it by no means follows that its knowledge is commensurate with its interest. But the frontier policy of the Government of India is not purely, nor even mainly, an Indian question. It concerns England as much as or more than it concerns India. If the attitude of reserve which has been maintained by Lord LYTTON's predecessors should be departed from, and the change should entail a heavy military expenditure, it is England, not India, that would in the end have to bear the burden. A military disaster is not like a famine—a mere matter of raising so many millions by loan. The whole strength of the Empire might have to be employed in order to retrieve it, and, if nothing less would answer the purpose, it most certainly would have to be employed. A change in Indian frontier policy which may possibly lead to results of this magnitude ought not to be left to the decision of any Viceroy, however versatile or however ingenious. We know what Lord LYTTON's predecessors have been about. Their policy may have been timid, or selfish, or short-sighted, or anything else that their censors are pleased to call it. Lord LYTTON may have a very much better policy in his pocket; that is a point which will be better decided when his efforts at winning confidence by showing confidence have passed beyond the stage of imposing generalities. But a Viceroy would hardly drag foreign policy into a Budget debate if he did not desire to do something different from what has been done for the last twenty years. If he does desire this, the less reticence he shows about his policy the better. The revolution may be a beneficial one, but it will be a revolution all the same. We took occasion a month ago (*Saturday Review*, March 3) to set out in some detail the reasons which have so long availed to prevent any change in the strictly passive attitude maintained by a succession of Viceroys as

regards the powers that are interposed between India and Central Asia. Those reasons involve political, strategical, and financial considerations of the highest moment. To appoint a Resident at Kabul, much more to occupy Herat, Kandahar, or Quettah may conceivably be sound policy, but its adoption would commit us to much that cannot now be foreseen; and, when a policy is full of danger in the future, it cannot be too carefully examined in the present. The Government of India can do nothing without the consent of the Secretary of State, and the Secretary of State can be challenged to say plainly what it is that the Government of India wish to do. If Parliament, having been put in full possession of all the facts and all the possibilities of the case, is willing to take a new departure, and to enter into fresh relations with Afghanistan, there will be nothing for it but to acquiesce. But acquiescence in the results of an inquiry is a different matter from acquiescence in the absence of inquiry. It is the latter frame of mind that is especially to be deprecated; and, on this ground at all events, we rejoice that the Viceroy has himself called attention to the question.

It is not easy to determine the precise meaning that is to be put upon Lord LYTON's speech in the Legislative Council. On the one hand, it is full of assurances that no good end will be attained by military expeditions, by spasmodic gifts, or by aimless expenditure of money. On the other hand, it seems to point to measures which, however pacific they may be in outward seeming, are yet exceedingly likely to lead at any rate to the first and last of these evils. Lord LYTON's dream of a belt of independent frontier States throughout which the British name is to be honoured and trusted and British subjects liked and respected, is to be realized, it seems, by "constant friendly contact with our less civilized neighbours and the presence in their midst of earnest upright English gentlemen." Negotiations and friendly intercourse are to extricate these States from the "anarchy and bloodshed in which they are now floundering"—in plain words, we suppose, the Government of India intend to place a Resident at Cabul. This step will no doubt be represented as designed to prevent the need either of military operations or a large expenditure of money. We are rather afraid that the effect of its adoption would be the very opposite of this. As we said the other day, if the first act of the drama is the Resident, the second is very likely to be "the escort, the third and fourth the cantonments and the brigade, and the fifth, in all probability, some precipitation of the very consequences we are by these means seeking to avert." The presence of an English gentleman, however earnest and upright, in the midst of less civilized neighbours, who do not want him, may be a political necessity. But it is mere self-deception to talk of it as a substitute for military occupation. If it is a political necessity, it is one which will probably bring a military necessity in its train. Lord LYTON declares that the object he has in view is so supremely important, and so greatly beneficial, as to justify a more systematic prosecution of it than has been yet attempted. He does not exactly say what this object is; but if, as seems probable, negotiation and friendly intercourse are to be the permanent instruments through which it is to be attained, the natural inference is that a radical change of policy is in contemplation. It is only doing the Government of India bare justice to admit that it rarely takes a step of this importance without having counted the cost and calculated the consequences. But when the cost and the consequences may easily be so serious, it is desirable that this prevision should not be confined to the Government of India. It is the people of England that would ultimately have to find the money for an Afghan war, or to bear the disgrace of an Afghan defeat; and with this contingency before them, it is the business of Parliament to insist on a plain statement of Lord LYTON's policy being submitted to it, before it is too late to inquire whether there are any good grounds for its adoption.

POLITICS IN THE PROVINCES.

TWO Cabinet Ministers have been starring in their counties, and a little Liberal gathering has been held at Carlisle. The East Cumberland Liberal Association secured the attendance of Sir WILFRID LAWSON, and caught on a flying visit Sir WILLIAM HARCOURT, who explained

that he was having an outing before the meeting of Parliament. The local Associations formed for political purposes are fortunately almost entirely independent of what is said and done at their gatherings, and it probably makes no material difference to the prospects of the Liberal party in East Cumberland whether, when its Association eats a public dinner, those who address it have anything to say or not. Otherwise those who assembled at Carlisle might have thought their time was being in some measure wasted. If the Association is to be successful, its success must consist in sending a member to Parliament who will enforce and possibly advocate the policy of the Liberal party. Sir WILFRID LAWSON must therefore have somewhat damped the spirits of his hearers when he occupied the time allotted to him in explaining what a dreadful nuisance it is for any one to be in Parliament. His account of what he himself has to endure at Westminster was graphic and probably correct. He has to sit up half the night listening to interminable bores talking unceasing twaddle. Nor is this all. He has to leave the country and live in London, where his ears cannot be gratified by the lowing of cattle, the bleating of sheep, or the singing of birds. Even when he gets back to his home he is not much better off, as he has to make speeches without having ideas, and to pay subscriptions without having the money. Such is the miserable position to which the Cumberland Liberals are invited to condemn a new victim. As to the policy of the Liberal party, he confessed that, so far as he went, he was not aware that the party had any policy, and he therefore invited Sir WILLIAM HARCOURT to be good enough to explain to an inquiring provincial audience what the policy of the Liberal party really is. Sir WILLIAM HARCOURT naturally declined, on the general ground that it was not his business to lay down the policy of his party, and on the special ground that he was taking a holiday, and ought not to be asked to spoil his holiday by having to think. This was an unanswerable plea, as it is obvious that a Liberal leader would never get a holiday at all if, while nominally taking recreation, he had to subject his mind to the severe strain of imagining what it really is that his party means and wishes. The simple fact is that the Liberal party has no policy in the sense of definite measures which it wishes to carry, or definite proposals as to foreign or domestic affairs which it wishes to see adopted. So far as there is at this moment any observable difference between the two great political parties, this difference consists in an undefinable divergence of political tastes and feelings. Liberals and Conservatives would probably act just now very much in the same way whichever party was in office; but, while doing the same things, they would lean in different directions; and if the East Cumberland electors, on the whole, like that direction best in which their new member would lean if they could secure his election, they may reasonably be anxious to find some one who will be willing at their request to exchange the delight of listening to the pleasant scolds made by sheep and cows for the painful pursuit of listening to Mr. BIGGAR.

Mr. WARD HUNT and Sir MICHAEL HICKS BEACH have much more to say than Liberals can have, for they can go on for ever praising the Cabinet to which they belong. They have each, too, a special department, and they can speak of the navy and of Ireland. Mr. WARD HUNT had not, indeed, much that was new to say at Peterborough about the navy, and had even once more to resort to his favourite topic that, whatever mistakes the Admiralty may make, the British tar will always do his duty. But as a personal revelation he was able to announce that he very much liked being criticized, as he felt that criticism braced him up. He is thus always doing himself good, and by providing unending food for criticism he is perpetually making himself happier and stronger. Of Ireland Sir MICHAEL HICKS BEACH was able to give a very good account, as it is getting every day more peaceful and prosperous. The Ministry, he explained, went on the principle of giving Ireland rest and doing as little as possible to encourage the Irish in their various whims. To do nothing is, as they have discovered, the simple secret of Irish administration. The Liberals had big measures for Ireland, and Ireland was in perpetual agitation. The Conservatives have no measures for Ireland, or next to none, and Ireland is quiet and happy. A Conservative audience was sure to be quite ready to accept this as a striking proof of the superiority of Conservative management. But it is obviously begging the question, as a Liberal might reply

that it is precisely because big measures were framed and carried that Ireland is now contented. The sole object of such measures as the Irish Church and the Irish Land Acts was to remove grievances which caused discontent, and if discontent has ceased, this may not unfairly be ascribed to the removal of these grievances. A similar observation may be made on all the glorifications which the present Ministry bestows on itself and its measures. It is very proud of having passed several small measures which have given little or no offence, and it is quite right in saying that it has done what the nation wished it to do. Small, inoffensive measures suited the temper of the times. The excitement of settling big questions which awoke many angry passions and much bitter feeling had worn the country out, and it was in the mood for a quiet life and a little gentle play. There was no wish to go backward, but there was also no wish to go forward; and the great merit of the present Government is that it exactly understood what it was wanted to do in a special and temporary crisis. It often happens in a school that one master works the boys hard all the morning, and another master takes them out for a walk in the afternoon. The Conservatives resemble the master who conducts hard-worked scholars for a gentle stroll, and it must be owned that they have discharged this amiable duty in a pleasing and not uninstructional manner.

But it is not to domestic successes that Conservative Ministers now point with the greatest pride. It is the foreign policy of the Cabinet that fills them with admiration of the most triumphant kind. It is certain that the Ministry has had most difficult problems to deal with, and it is probable that it has done on the whole as well as any Ministry would have done. But it is not easy to go much further. No doubt Lord DERRY has shown the virtue of patience for which his colleagues praise him so enthusiastically. He has gone plodding on, writing a series of guarded despatches, striving to do his duty, and earnestly working for peace. But it is not easy to see in what definite way he has contributed to the settlement of the Eastern question. What more especially awakens the admiration of Mr. WARD HUNT and Sir MICHAEL HICKS BEACH is the mode in which Lord DERRY treated the Berlin Memorandum. The form in which it was presented was offensive to the dignity of England, and Lord DERRY very properly objected to this, and his conduct met with the approval, not only of his countrymen, but of impartial foreigners. But it was quite otherwise when he not only rejected the Memorandum so far as the question of form went, but also refused to have anything to do with its contents. This isolation of England was strongly and warmly deplored by Powers so friendly as Austria and France. And what has it all come to? Lord DERRY has at last signed the Protocol, and the Protocol is really nothing but the Berlin Memorandum in another shape. It recognizes the grievances of the Christians and the proposed intentions of the Porte to make reforms. It announces that the Powers will carefully and minutely watch to see whether those reforms are carried out; and if they are not carried out, then they will concert as to what measures are to be taken. This is practically the Berlin Memorandum over again. In the present state of affairs Lord DERRY is not to be blamed, or rather he is to be strongly approved, for signing the Protocol. It was the best thing he could do under the circumstances. He wished to avert war, and took the only means in his power to avert it. But, so far as he has shaped the circumstances in which he now finds himself, he has so shaped them that he has come to accepting the Memorandum which he gained so much glory in the eyes of his colleagues by rejecting last May. If this is a triumph, it is a triumph which it must be left to Gloucestershire and Northamptonshire Conservatives to estimate at its proper value.

SOUTH AFRICA.

THE latest accounts from South Africa, though they require further explanation, seem to confirm the probability of a federal union between the English Colonies and the Dutch Republics. Mr. BURGERS, President of the Transvaal, now openly supports the policy which he had hitherto opposed, and his conversion is the more remarkable because the Kaffir war has been for the present suspended. It is said that the terms of peace were humiliating and unsatisfactory, and a fresh rupture may probably be

impending, as it is evident that uneasiness and alarm have produced a division of opinion. The Volksraad appears still to profess a desire of maintaining the independence of the Republic, but at the same time it is willing to form a close alliance with the English Colonies. Sir THEOPHILUS SHEPSTONE, as the agent of the Colonial Office, declines to negotiate on the assumption that the Transvaal is to remain independent; and on the whole it seems probable that the arguments which have convinced Mr. BURGERS will ultimately find acceptance with his countrymen. The story of the whole transaction is evidently fragmentary and incomplete. Lord CARNARVON, as a prudent and constitutional statesman, may be trusted not to pursue a policy of annexation except under the pressure of sufficient reasons; and, on the other hand, the Dutch settlers would not even discuss the surrender of their independence if the necessity of union were not urgent. The jealousies and the feelings of irritation which caused them to renounce their allegiance to the English Crown many years ago are probably still operative. Their grievances since the first English conquest of the Cape have lately been recorded by a Scotch writer with a violent partisanship which must have been borrowed from the inhabitants of the Republic. When the two outlying States were constituted, the seceding Dutch relied on their own ability both to defend their territories and perhaps to extend their dominions at the expense of the natives. The late petty war appears to have suggested a reasonable dread of their formidable neighbours in the interior of the continent. The success which was at one time attained was almost more mortifying than defeat; for the Boers owed their victory to native allies, while their own levies displayed little warlike aptitude. As the proposed union would be most directly beneficial to the weakest constituents of the Federation, it will be desirable not to exhibit an urgency which might induce the people of the Transvaal to think that they were conferring a favour. Fortunately, entire confidence may be placed in Lord CARNARVON's discretion and tact. The Doppers or Dutch yeomen are still opposed to union with the English Colonies; but the settlers in the gold-fields and the small traders of the towns or villages unanimously desire immediate annexation.

If the Transvaal were effectually isolated, it would be unnecessary that the English Government should interfere for the protection of the Republic against internal troubles or external dangers. The expediency of allowing the Dutch farmers to assert their independence may have been more than questionable; but in ordinary circumstances there would be no pretext for revoking the concession. It is only because a war provoked by the Transvaal is likely to extend into the English possessions that the Imperial Government can be driven to assert the right of exercising a control over the method of dealing with the natives. Natal and West Griqualand are occupied by a scanty population of English settlers who are largely outnumbered by the natives. Beyond the frontier are warlike tribes of the same race, whose strength and numbers are unknown; and in case of war the Kaffirs may probably not be careful to distinguish between two European races. There is reason to believe that the late hostilities in the Transvaal were caused by encroachments and acts of violence on the part of the Dutch farmers; and it hereafter the English Government is compelled for the sake of its own subjects to extend protection to their neighbours, it is both entitled and bound to claim a control over the policy on which peace and war may depend. The peremptory language which is attributed to Lord CARNARVON's envoy, and the partial acquiescence with which it has been received, can only be explained by the knowledge of both parties that serious danger is to be feared. Except for purposes of defence against native tribes, the return of reluctant and malcontent subjects to their former allegiance would not be a desirable acquisition. It is not known whether the Orange Free State is better disposed to enter into negotiations for federal union than it was during the visit of President BRAND to England. In both the Dutch Republics there is an English minority which will probably use in support of confederation any influence which it may possess.

The Ministry of the Cape Colony has not yet formally adhered to Lord CARNARVON's policy. The most important community in South Africa is disinclined to join on equal terms a confederacy of comparatively insignificant settlements; and the question is further complicated by the anxiety of the Government of Cape Town to prevent the

separation of the Eastern province from the Cape. The local Government is proud of the success with which it has hitherto managed the natives, and, entertaining no apprehension of war, it is not disposed to make sacrifices for the benefit of Natal or of the Transvaal. The policy of founding a nation in South Africa which may hereafter become powerful is more comprehensive and more statesmanlike; but the hesitation and the susceptibility of Mr. MOLTENO and his party are not unintelligible. Modern experience has proved that even loyal colonies are habitually actuated by a morbid suspicion of the interference of the mother-country. From time to time almost all the greater English colonies have rejected with violent indignation, and even with threats of secession, measures which had been proposed by the Colonial Office in the belief that they were inoffensive. When there is a similar collision of policy, the Imperial Government always sooner or later gives way. Many years have passed since the colonists of the Cape enforced the discontinuance of transportation; and the same concession was extorted by the Australian colonies, although the only settlement which was directly concerned in the question was not unwilling to receive English convicts. The Cape may perhaps be reconciled to the scheme of confederation when it is once thoroughly understood that neither Lord CARNARVON nor any of his successors will impose their policy on the colonists without their consent. Among other paternal attributes of the English Government is a willing recognition of the right of dependencies to the privileges of maturity.

The most zealous of colonial critics cannot plausibly impute to the Home Government the purpose of increasing its own power by promoting division. Confederation may not be universally applicable to adjacent settlements, but it necessarily tends to make them more independent. The Dominion of Canada has almost ceased to complain of Imperial interference since it has assumed the dimensions and character of a powerful State. On a smaller scale South Africa is invited to adopt an organization which will enable it to govern itself, and in the first place to provide for its own security. The dissentients from Lord CARNARVON's policy, while they protest against alleged dictation, are anxious to throw on the English Government the burden of defending the smaller settlements from native invasion. It fortunately happens that colonial questions have in recent times been entirely withdrawn from the region of party politics. In a former generation Ministries were endangered or overthrown in contests relating to the affairs of Canada or Jamaica. The universal acceptance of the doctrine of responsible government for the colonies has had the incidental advantage of rendering colonial policy independent of Ministerial changes. Lord KIMBERLEY habitually supports the measures of Lord CARNARVON, and if he, or one of his Liberal allies, hereafter returns to the Colonial Office, there will be no factious opposition to apprehend. The House of Commons, while it constantly assumes to itself more complete control over domestic administration, abstains with a sound instinct from officious meddling with Indian or colonial disputes. When the Minister has succeeded in reconciling the jealousies and obviating the objections of the Colonies and the neighbouring States, he may confidently rely on obtaining the approval of a scheme of confederation by the Imperial Parliament. The project is at present embodied in a Bill which has been circulated throughout South Africa, before it has been submitted to either House or officially published in England.

FRENCH FACTIONS.

THE election which is to be held to-morrow at Bordeaux will be of more than usual interest. It is, as so often happens under a system which makes an absolute majority of the votes given necessary to the return of a candidate, a second ballot; but it differs from most second ballots in one most important particular. At the first ballot there were three candidates—a moderate Radical, an extreme Radical, and a Legitimist. The extreme Radical got more votes than the moderate, and, according to the usual practice when there are two candidates nominally belonging to the same party, the one that had the fewest votes has retired. But the absurdity of leaving the moderate Republicans in the constituency no alternative but to support either a Royalist or a Radical revolution has apparently struck some of the Bordeaux electors as too absurd to be endured any longer. A moderate Radical

candidate has accordingly come forward in the room of the candidate who has retired, and the contest of to-morrow will again be a triangular duel. Supposing that only the voters who took part in the first ballot come to the poll in the second, the Irreconcilable candidate must be successful. But the hopes of the moderate Republicans are built upon the fact that at the first ballot there were a large number of abstentions; and it is assumed, with apparent reason, that, as it is not the custom of extreme politicians to abstain from voting at elections, these absentees must be moderate Republicans, in the sense at least of not preferring any other form of government. It was not for want of appeals to them to come forward that these electors stayed in their tents at the first ballot. They must have been aware that the extreme Radical candidate was an Irreconcilable, and that, so far as he had any influence in the Chamber, it would be directed to the destruction of the Conservative Republic, and to the substitution for it of a Republic which, in the eyes of these moderate electors, means the Reign of Terror over again. This knowledge was not sufficient, however, to bring them to the poll. Either because they were altogether indifferent to politics, and cared no more for the election of a deputy than an ordinary Londoner cares for the election of a vestryman, or because they drew no distinction between the moderate Radical and the extreme Radical candidate, or because they did not care to show themselves in open opposition to the Conservative candidate, or from some local or personal cause which has not come to light, they chose to stay at home rather than to do the little that was required to defeat a candidate whom they must have thoroughly feared. It may be of course that the imminence of the return of the extreme Radical may rouse them into greater activity than they have yet shown. At all events it becomes a question of great interest whether it will have this effect or not. If it has not, it cannot be for want of all the ordinary incentives to action. Bordeaux is an extremely Radical city—extremely Radical, that is to say, in the sense that its Radicalism is of the most violent type. Political partisanship in the South of France is not in the least mealy-mouthed. Radicals express their feelings with the most perfect frankness, and leave their adversaries in no uncertainty as to the destiny to which they would consign them if they had the power. Consequently the moderate Republicans of Bordeaux have had full warning of the danger in which they would be placed if the Irreconcilable faction gained possession of the government. There is no reason to suppose that they are indifferent to this danger, or that they would not, if necessary, welcome a dictator of some sort as a refuge from it. But, though they would probably be willing to confirm the appointment when some one else had made it, they have as yet shown no trace of that political energy which would enable them to dispense with a dictator. The moderate Republican party has every chance in its favour except one. It is numerically strong, for a large part of the preference which was formerly felt for the Empire as being the Government which best assured order at home and tranquillity abroad has passed to the Republic as being the Government in possession, and, more than this, as being a Government which has given very sufficient evidence of its ability to hold its own against insurrection. It has possession of the machine of government, which in France is a consideration of enormous force. It has a large majority in the Chamber, and nothing more is needed than a determination to make their numbers felt at the election to ensure the retention of this majority. Yet, with all these advantages, the moderate Republicans seem to have as little energy or organization as though they were an oppressed and isolated minority. To-morrow's voting at Bordeaux may possibly show that this apathy is beginning to be disturbed. It is certainly high time that it should be, if the moderate Republicans intend to maintain their advantage in the next conflict of French factions.

The latest act of the Government has been to dissolve the Paris Catholic Committee. That this Committee, like all the Catholic agencies which it served to link together under some approach to a central organization, was intensely hostile to the Government and to the Republic is undoubted. The French clergy seem to have made up their minds that there is nothing to be hoped for from the Republic, and they are consequently anxious to replace it as soon as possible by a Government of better ecclesiastical dispositions. They may be Legitimists or Imperialists at their pleasure; upon this point the

Church leaves them free to follow their individual preferences. But they are not free to proclaim themselves Republicans, because there is no chance that the Republic, even in its most moderate type, will do anything for the cause which the Roman authorities have nearest their hearts. If the Republic would fight for the restoration of the Temporal Power, it might to all appearance secure the active support of nearly all the priests in France; but, as there is not the least chance of its doing this, it becomes the duty of every good Ultramontane to strive to compass its overthrow by every means in his power. That the Roman authorities can really feel any assurance that another Government would do any better for them may be doubted. They have had experience of every form of monarchy of late years, and they must know that one and all have left the Pope to shift for himself. Their feeling probably is that, if in some of the impending European complications the chances of the Temporal Power should improve, it would at least be an advantage to have a Government in France which would have no objection on principle to give the Pope a helping hand. Either of the two possible restorations would answer this description, and for this reason the clergy are perfectly ready to support either the Count of Chambord or Prince Louis Napoleon in the event of it being possible to take either course to any practical purpose. Still an explanation of the hatred of the Church to the Republic ought not to constitute an explanation of the severity of the Republic towards the Church. If the Catholic Committee of Paris has really been intriguing against the existing order of things in any way that can be brought home to its officials, it might be a useful warning to bring it to trial. The impudent assumption of the Clerical party that, so long as a revolution is of the right sort, it is not in the least inconsistent with Conservative principles to bring one about, deserves to be sharply dealt with. But the dissolution of the Catholic Committee is almost tantamount to a confession that there is no charge that can be brought against its members with any chance of success. Such a step is like suspending the Habeas Corpus Act. It implies that there are men against whom nothing can be proved, who nevertheless cannot be trusted with the ordinary liberty of association. There may of course be conditions under which this is a necessary measure of precaution; but such precautions have always the drawback of giving importance to the persons attacked. This is undoubtedly the effect which the dissolution of the Central Catholic Committee will have in France; and it is difficult to see any gain that the Government can expect to reap which will at all compensate for this undesigned tribute to their enemy's pretensions.

THE VOLUNTEERS.

THAT, if a thing is worth doing, it is worth doing well, is an old saying which the War Office seems too apt to neglect. There was at one time a great deal of gushing talk about the Volunteers as the element of national defence which rendered the country for ever safe from foreign invasion; and the military authorities, with all their contempt for civilian assistance, found it expedient to humour the movement, if it were only for the sake of keeping up a popular disposition to accept the Army Estimates without criticism or cavil. Now, however, though there is not the same enthusiasm about the Volunteers, they have settled down into a steady, business-like force of a very valuable kind. That they are still in a somewhat crude state, especially as regards their officers, must be admitted; but there can be no doubt that they have in a quiet way, without any fuss and parade, greatly improved in drill and discipline. The Volunteer service is practically supported by private subscriptions of large aggregate amount, for the Government grant is little more than nominal; and there is also a great deal of steady, hard-working industry in the regular drilling of the regiments. It is stated, for instance, that in some of the London corps they have now drills four or five days a week; and this of course means expenditure of money as well as time. Moreover, the sort of public spirit which is fostered by the Volunteer system is a most valuable element of national defence. Thus the Volunteers, as far as they can do anything by themselves, have done a great deal, and deserve every credit for it. At the same time it is evident from such performances as those of Easter Monday

that they have yet to learn how to act in collective operations, if they would avoid mistakes which in real service would simply give them over to wholesale destruction. Both the *Times* and *Daily News* give very fair and discriminating notices of this mimic warfare, and the observations of both seem to point to the same conclusion.

The *Times*' Correspondent mentions that at the very outset the Herts Rifles made a great mistake in entrenching themselves in a ready-made fortification, Totterhoe Castle, instead of occupying, as they should have done, two advanced knolls, "from which they could have swept the ground over which the enemy must advance for a distance of seven or eight hundred yards." This, it seems, is a danger which the Prussians declare to be a very real one, and they deprecate parapets and ditches, unless under very exceptional circumstances, as leading the troops into insecure shelter in cases where forward audacity is the essence of military success. Next, after the Honourable Artillery Corps had fired the round which gave the signal for the beginning of the action, it was found that their ammunition was nearly exhausted. They had brought down with them only three charges, one of which was used, and the further supply which had been expected could not be obtained. They did their best to take up excellent positions, but mere attitude without fire is a poor resource for artillery. Then, again, the shutting up of the little garrison in Totterhoe Castle led to their being surrounded and on the point of being taken prisoners, if they had not been got out by a general order to cease firing; and it also produced subsequent confusion. Indeed, at a very early part of the day the plans of the General in command "began to be ignored." A "brisk letting off of rifles" delighted the crowd, but dissatisfied military men and even the better informed among the actors themselves. "There were two serried lines, with a row of brigadiers and umpires between them repressing the boiling spirits of the men"; and "the fight was practically at an end." The *Times*' Correspondent also points out that, from neglect of preserving the touch between brigades and battalions, spaces were left into which an active enemy might have thrust a column, and so broken up the line. The formations for attack and defence were also lamentably weak in depth, so that, in the event of a sudden attack by a concealed body of the enemy, the line would have been practically destroyed. Moreover, we are told, a great deal too much ground is usually covered by these manoeuvres, and sufficient attention is not paid to the necessity of always preserving a strong reserve to meet flank attacks, to reinforce threatened points, or to make a concentrated and vigorous effort at the critical point of the fight. And, worst of all, the men expose themselves in the most absurd and reckless way. "When two forces found themselves in contact, for want of elementary tactical training they simply stood and blazed away without effort on the part of either of them to concentrate at any particular point, and so break the enemy at that spot."

The Correspondent of the *Daily News* gives a very similar account of the operations. "With a tenacity," he says, "that argued more valour than discretion, the Herts men came from the shelter of the farmsteads and coolly defied their foes by standing exposed to a murderous fire in the middle of an orchard. If every muzzle of the rifles that kept up such a ceaseless roll from the crest of the hill had covered its man, few of the devoted band below would have returned to their hearths and homes at night; but the aim of their foes was bad, and so a battalion that might have been annihilated was ready to come again when wanted." And then towards the end "it looked very much as if each division had determined not to give way to the other, and having decided to brave annihilation rather than defeat, had taken the readiest means to secure a glorious end. At a distance of a hundred and fifty yards opposing lines stood calmly blazing to their front, scorning to take shelter as they scorned to yield an inch, and those who had no more cartridges to fire continued to snap defiance at their opponents with empty rifles." It is obvious that unintelligent muddling exercises of this kind are a most fatal way of preparing the Volunteers for real fighting, and if they are not fit for real fighting, their existence is not only useless, but mischievous, as encouraging a false notion of security. It is of course no discredit to the Volunteers themselves that they are apt to be light-headed and blundering on such occasions as that of the Easter Monday review. According to the *Times*' report the movements of the men, as regards the ordinary drill,

were good; their actual firing on the whole was very steady; and the rate of firing was regulated by officers and non-commissioned officers with an effect which is said to have been really surprising. The moral which the writer draws from this experiment is that what is wanted is not so much drill, of which there is already enough, but tactics; and for tactics the Volunteers must of course look beyond themselves. The classes of people who supply the rank and file of the Volunteer regiments are of course very fit and sufficient for their work; but there is, as might be expected, a grievous lack of trained and competent officers.

The great fault of the War Office in this matter is that it keeps the Volunteer force too much on the footing of a plaything; and, though it is always liberal of flattering words about it, does not do it justice in the way of assistance and supervision. Thus we find that the Artillery Company has for several years been petitioning in vain for a few rifled guns to replace the old six-pounder smooth-bores, which are practically obsolete weapons. And unfortunately this tendency to live in a sort of fool's paradise, and to make believe that the army is perfect in every respect though it is notoriously the very reverse of perfect in many important respects, affects not only the militia and Volunteers, but the regular army. In this month's number of *Macmillan's Magazine* there is an anonymous article on army reform, which is, however, attributed to a very able and distinguished officer of high rank, in which the writer makes an emphatic protest against the way in which the training and education of the army is still, to a great extent, left to mere "barrack-yard soldiers, admirable sergeants-major, "but no more," and points out that as long as the direction of army matters is left in the hands of such people, there can be no hope of the effective reorganization of our military system. It is also pointed out that those in power are deluding the country, though probably only because they have first deluded themselves, when they pretend that "a small number of weak battalions on "parade, which have no reserves behind them, and for "the expansion of which to war strength no proper "arrangements have been made," is a substantial and efficient army; and that this mistaken policy is bringing things to a dangerous crisis. There could not be a more striking illustration of this fatal self-sufficiency and neglect of essential measures than the resolution which has been come to not to hold any autumn manoeuvres during the present year. If the militia and Volunteers are to be of any value on an emergency, there can be no doubt that they must be properly exercised, not merely in barrack-yard drill, but in those larger movements upon which actual warfare depends, and that the one way in which this can be effectually done is by the manoeuvres which are to be suspended.

HAPPY HOLIDAYS.

AT first sight nothing seems less fitted to supply material for a cynical view of human life than the subject of holidays. The very name is apt to suggest all kinds of agreeable associations, recollections of school-day frolics, images of picturesque national customs, of the village green, the may-pole, and the rustic dance. People are disposed indeed to look on recurring holidays as the few pleasant gleams which light up the monotonous gloom of life. How then, it may be asked, can such a subject lend itself to the pessimist's treatment? To this our cynical observer might answer, that while the idea of holidays is bright enough, the realization of the idea is attended with so many difficulties and drawbacks that it becomes a theme for complaint rather than for exultation. And without doubt there is much to be said for this view of the subject. To the schoolboy a holiday is an unspeakable boon, sent by the generous gods. It stretches out before him as an infinite region of undefined delights. To the young generally, as to Mr. Browning's Pippa, a holiday is a precious thing, the least portion of which must not be wasted—

Oh, Day, if I squander a wavelet of thee,
A mite of my twelve hours' treasure.

In spite of parents' complaints, too, boys generally manage to dispose of long vacations without wearying. Their constantly renewed flow of mental and bodily energy, and their skill in all manner of occult inventions for filling up the vacant hours, enable them to take long draughts of this idle enjoyment. But how different from this is the condition of a busy adult in prospect of an extended holiday! In the first place he may lack the impulses and tastes which are essential to holiday enjoyment. The young man whose interests are centred in the City, whose mind in its daily

movements sweeps a curve bounded at one extremity by the doings of the Stock Exchange and at the other by the romantic gossip so prettily purveyed by a favourite barmaid, finds himself at a loss when the City tumult is hushed and he is called upon to pass a day away from his familiar haunts. Nature does not allure him with her gentle beauty; he is much too dissipated with town life to care for vigorous bodily exercise over tangled moorland or on the bosom of the rapid river. His holiday is thus a burden to him, and long before it has expired he is heartily sick of it. No one probably will deny that there are many persons nowadays in this condition of incapacity. They want the quick nerves, the muscular energy, the feeling for air and colour and sound, the love of free unimpeded motion, which are essential to the full delight of a holiday out of town.

Again, even where the tastes and capacities requisite for these otiose enjoyments are present, the holiday may prove a failure from other causes. One condition of enjoying a holiday is to have one's mind perfectly absorbed in the present, to have one's consciousness saturated, so to speak, with the impressions and suggestions of the hour.

*Lætus in præsens animus, quod ultra est,
Oderit curare.*

Yet few people in this busy age are capable of attaining to this state of mind. A man may love nature, he may long to taste of the delicious sense of *dolce far niente*, and yet all the while find himself held back from pure holiday contentment by the force of deeply-fixed habits of life. Thus there are tendencies of thought to be overcome. The mind must be able to free itself from the hold of customary ideas and interests, and this is often difficult enough. Then there are the results of the man's whole mode of life, the almost instinctive disposition to proceed methodically in the laying out of one's time, &c., and these habits of order and punctuality may prove fatal to the quiet and serene enjoyment of leisure days. A man whose temper is seriously disarranged by a delay of five minutes in the serving of his dinner is not a good subject for a day's rambling in the country. With this habit of punctuality there commonly goes an excessive impulse to be busy. People trained in our large towns to habits of constant activity, and to the most scrupulous employment of every moment, are not fitted for the easy, careless attitude of the holiday-maker. Such persons, if they are to enjoy a holiday at all, can only do so by largely transforming it into something not unlike a common working day. They map out the hours of the day with the most anxious care, are concerned to accomplish as much as possible in the time given them, and thus go the very way to miss the most valuable characteristic of holiday experience—the sense of perfect freedom from rule and fetter, and the joy of self-abandonment to the delights of repose.

The causes we have just spoken of are of a nature to undermine the whole pleasure of a holiday. Let us now look at one or two influences which serve to circumscribe the range of this pleasure. Here, again, we have to touch on the effects of daily customary life in producing certain organized habits of thought and feeling. Perhaps the most striking effect produced by our modern social life on the permanent tendencies of individual character is the habit of viewing all parts of conduct as having a social or moral aspect. Mr. Matthew Arnold not long since ventured to define the proportion of human conduct covered by moral obligation. It may be said that the unphilosophical mind is apt to extend a sort of ethical jurisdiction over the whole territory of life. Conscientious persons, busily occupied with affairs which they think to be important, continually use language in relation to their vocations which implies that these are a matter of strict obligation. A man says, I must get a particular piece of work done to-day, and, failing to do so, he feels a distinct pang of remorse. The effects of this excessive development of the moral sense are clearly apparent in the ideas entertained respecting holidays. It is very curious to observe a busy man who is about to take a short holiday. He seems to be half-ashamed of what he is going to do, talks apologetically of his plans, excuses himself on the ground of recent over-work or present ill-health. Such persons are manifestly incapable of enjoying holiday repose and light diversion, except on the understanding that they have a right to do so. The common mode of self-justification is, of course, to refer to the claims of health and the need of an occasional intermission of labour. Only when this idea is present can the rest or the light activity of holiday hours be acceptable. It follows, then, that people of this severely conscientious habit of mind soon exhaust the possibilities of holiday intervals. As soon as they begin to suspect that there is no longer any need of relaxation of mind, the sense of duty intervenes, and then the mind grows insensible to the fascinations alike of natural scenery, of architecture, and of country life.

A habit of thought and conduct intimately related in its origin to the sense of obligation is the tendency to act in agreement with others. This impulse is clearly connected with the action of the social medium on the individual. It goes back probably to the earliest stages of social life, when sociability meant little more than the gregarious impulse to keep together. In any case it is certain that in most people the disposition to imitate others and to act in concert with them is a firmly rooted element of character. When this impulse is in great excess, it may be positively painful to do many kinds of things apart from others. Thus it often happens with the busy, conscientious class of people just spoken of that they strongly object to taking a holiday alone. If the day is a

general holiday, they can easily bring themselves to share in it. Indeed the social impulse to act in concert, and to take enjoyment in a sympathetic fashion, would in this case lead them to cast aside their work, to doff their town attire, and to follow their fellow-citizens to the hills, woods, or sea. It is this limitation imposed by social training which gives to general holidays and holiday seasons a part of their value. It is not only that companionship and sympathy add to the enjoyment of each, or that there are obvious social conveniences in a simultaneous breaking up of town life, and a fitting over land and sea to tourist haunts. In addition to these conspicuous and patent reasons there is a further and less obvious one—namely, that people find it hard to justify themselves in throwing off the shackles of social relations and of prescribed vocations, and that this operation is rendered much easier when they see their friends and acquaintances doing precisely the same thing. If morality is but a mode of the common uniform action of members of a society, it becomes easily conceivable that, when the collective mass consents to intermit customary habits of life, the individual's conscientious difficulty in taking a holiday is to a large extent removed.

In these, and probably in other ways too, the capacity for holiday enjoyment, for the pleasure of long hours freed from the claims of daily work and handed over to us to be filled up as we like with grateful activities, appears to be greatly interfered with and restricted by the circumstances and influences of modern social life. And here, as we have observed, the pessimist might find an excellent opportunity for enlarging on the irony of life, on the stupidity of mankind when just within reach of what seems most bright and promising in their earthly lot. Yet it may reasonably be asked whether the facts are quite as doleful as they are described by our imaginary lugubrious philosopher. We think at least that there are not wanting a few alleviating considerations. It may be argued, for example, that man's happiness is, after all, best found—in our climate at least—in a busy, active life, and that though this entails the loss of much delicious sensation, it constitutes on the whole and in the long run a gain and not a loss. Again, it may be said that, though we are apt, when attempting to make the most of a holiday, to feel trammelled by habits impressed on us by our dominant circumstances and permanent forms of life, the very contrast between our habitual and our occasional surroundings tends to enhance the charm of the latter. Nothing is so well fitted to prepare a man for enjoying repose as hard work; nothing tends so certainly to quicken the sensibility to rural scenery as a long residence in the murky air of London. And it may be said that, in the case of more thoughtful persons who are less bound by mechanical habits, the rarity and freshness of the brief holiday does more to increase its value than the force of habit does to lessen it. It is to be remarked, too, that these habits do not commonly begin to reassert themselves till some period of leisure has been spent. It is after a man has been sojourning week after week and month after month in a southern climate in idle enjoyment that the ingrained impulses of duty and life-work begin to clamour most obstinately for a hearing. Hence, though this may tell against prolonged periods of idle enjoyment, it does not tell against brief intervals of relaxation. Again, if the high development of our active impulses disqualifies us for enjoying the southern ideal of a holiday, the repose and idle gossip of the Villa Reale or the Pincian Gardens, it does not follow that we do not in our own fashion realize as much enjoyment as these lovers of indolence. Did not Charles Kingsley, for example, extract as much delight from a day's excursion by a rocky stream well-stocked with trout, or over moorland rich in plant life, as an Italian who whiles away his time before a *caffè* in the piazza or Corso? In addition to all this, there is the fact that, as people get more busy, they show themselves more concerned to secure recurring periods of relaxation. The rapid development we have seen of late years, especially among the middle classes, of the custom of a summer excursion must point, it would seem, not to a falling off, but to a growth of the capacity of disposing of leisure pleasantly. We suspect indeed that most people have more of the holiday instinct in them than they care to toll. One may often notice that a man who excuses himself for indulging in a temporary withdrawal from his customary work is in his heart thoroughly eager for the change. We half make ourselves believe that it is a jaded nervous system which demands rest and change, whereas in reality we are impelled by a sense of the monotony of our routine life, a feeling of weariness at the unbroken recurrence of the same scene, the same faces, the same occupations, and an irresistible longing to flit away to some fresh surroundings. Such considerations as these may serve to show that the sum total of felicity derived from holidays is greater than a review of its limitations at first suggests. Perhaps, after all, there is not much room here for a complacent and optimistic tone; the conditions of a thoroughly happy holiday are no doubt very complex and not easily satisfied. At the same time it would hardly be just to draw the inference that holiday-making is wholly an illusion, a vain grasping after a shadow.

THE VATICAN COUNCIL REHABILITATED.

THERE are two ways of dealing with an indictment. You may either deny the alleged facts outright and set yourself to disprove them, or you may quietly accept them and proceed to cite them as evidence on your own side. In the first instalment of his

"True Story of the Vatican Council" in the *Nineteenth Century*, Cardinal Manning seemed disposed to rely chiefly—with what success we have already had an opportunity of examining—on the former method of defence. In his second paper he does not indeed abandon this line of argument, as will appear presently, but he combines it with a bold and almost defiant assertion of facts too patent for denial, but which to ordinary apprehension supply the strongest confirmation of the very points he is engaged in contesting. Before, however, we notice this fresh contribution to the authorized Papal version of the tale, it may be worth while to put on record a remarkable announcement made not long ago by the Roman correspondent of the *Allgemeine Zeitung*, to the effect that a work on the Council by the late Cardinal Viteleschi is already in print, but is carefully guarded under lock and key till the death of the present Pope, when it is at once to be issued, with the author's name, and under the editorship of his brother, the Marquis Viteleschi, better known to our readers under the sobriquet of "Pomponio Leto." "It proves afresh," according to this correspondent, "the entire want of freedom during the Vatican Council, and that from its first meeting to its prorogation and definitive suspension after the entrance of the Italian troops into Rome it was under the strongest and most despotic coercion ever exercised over the deliberations of any assembly. The Cardinal gives the minutest particulars. From the proof of this coercion, and the complete absence of freedom of discussion, he draws the inference that the decisions of the Council have no validity, and its decrees must be regarded as null and void." If there is any truth in this report—and all we know of the late Cardinal renders it highly probable—it affords at least fresh evidence that Cardinals, like doctors, sometimes disagree.

We are told at the opening of this second paper of Cardinal Manning's that the causes of the infallibilist definition "lie on the surface of the history of Pius IX.'s pontificate"; which is only another way of saying what the assailants of the Council have contended all along. Some of these causes the writer proceeds to specify; and first he dwells on the definition of the Immaculate Conception in 1854 by the sole authority of the Pope, which could have had no meaning "if Pius IX. did not bear an infallible office," while it also "powerfully awakened in the minds both of clergy and laity the thought of infallibility." Of course it did; that was its main object. Cardinal Manning is virtually endorsing what has been said over and over again on the opposite side, that the definition of 1854 was "a pilot balloon" sent up to prepare the way for the definition of 1870. But this was carefully kept out of sight at the time, and the Court of Rome displayed its wonted astuteness in the selection of the doctrine to be thus defined. It was well known that the truth of that doctrine was almost universally held throughout the Roman Catholic Church, though an influential minority among the Bishops were opposed to defining it as an article of faith. Theologians like Dr. Dollinger—who has changed his mind about it since—were as little disposed as Dr. Manning to question its abstract truth at the time; and hence, when the dogma had been proclaimed, they were able, without any great strain on their conscience, to accept the logic of accomplished facts. They did not believe in the infallibility of the Pope, but they believed in the infallibility of the Church, and in defining this dogma the Pope might be reasonably or plausibly maintained to be acting simply as the mouthpiece of the universal consent of the Church. They acquiesced accordingly without forecasting the use which adroit controversialists would make of their acquiescence a few years afterwards. When Cardinal Manning asks what was the act of 1854 if Pius IX. was not infallible, he is careful to forget a distinction which the party under his leadership took particular care should not be forgotten in framing the definition of 1870. The dogma of the Immaculate Conception might be, and often had been, represented as resting in the last resort on the consent of the Church, but the Vatican decree declares definitions of the Roman Pontiff to be "ex sese, non autem ex consensu Ecclesie, irreformabiles," and the clause we have italicized was insisted upon as essential in spite of all efforts of the Opposition. "The events of 1854" did therefore prepare the way for the events of 1870 in the sense that those who accepted the first definition were entrapped into an admission intended to be afterwards used against them, the possible applications of which they failed to foresee. Cardinal Manning passes on to the gathering of 500 Bishops at Rome for the Centenary of 1867, when they were induced—not of course without deliberate purpose on the part of the wire-pullers—to sign an address to the Pope in which Peter is said to have "spoken by the mouth of Pius." And this is quoted as parallel to the exclamation of the Council of Chalcedon in 451 that "Peter had spoken by the mouth of Leo," both alike containing an implicit assertion of Papal infallibility. Those Bishops however who knew anything about the Council of Chalcedon would be perfectly aware that their language implied nothing of the kind. The famous "Tome of St. Leo"—who was a theologian as well as a Pope—was submitted at the Council of Chalcedon to a rigid examination, paragraph by paragraph, and it was only after ascertaining its orthodoxy that the Bishops exclaimed that "Peter had spoken by Leo"; just as e.g. the hearer of a modern sermon which had come home to his mind and conscience might say, as people often do say in such cases, that God had spoken by the mouth of the preacher, though nothing was further from his thoughts than to imagine the preacher to be infallible. The words of the Bishops at Chalcedon form one of the stock quotations of every infallibilist advocate, but their acts afford the most conclusive

evidence that the opinion ascribed to them was utterly foreign to their ideas. And so little had Leo I. himself any notion of his own infallibility that he expressly states in his Epistle to the Bishops of Gaul that his Tome could not have dogmatic authority till it was confirmed by the Bishops. Cardinal Manning has need to refresh his memory as to "the true story" of the Council of Chalcedon.

Nor is he much happier in his next historical flight. We have a sort of bird's-eye view of the histories, which are regarded as very analogous, of the doctrines of Papal Infallibility and the Immaculate Conception. Both are said to have passed through three successive stages—of simple belief, which was universal in the early ages, of analysis and controversy, and of final settlement. It would be idle to attempt within our present limits any detailed exposure of this startling historical caricature. One example may suffice to prove what confidence can be placed in the Cardinal's history of the doctrine of the Immaculate Conception. "The second period began in the Pelagian controversy, when S. Augustine, in affirming the universality of original sin, expressly excepted the Mother of our Lord." Nobody would gather from this sentence, what the writer can hardly be ignorant of, that the passage referred to in St. Augustine's Treatise on Nature and Grace does not refer to original sin at all, but to actual sin. The great Roman Catholic and Ultramontane divine, Cardinal Torquemada (not the inquisitor of that name) points this out at length in his work on the Immaculate Conception, and shows that in the context St. Augustine expressly includes the Blessed Virgin in original sin. As to the growth of the doctrine of Papal infallibility, one example again must suffice here. "The amplest proof of this truth is to be seen in the relation of the Pontiffs to General Councils, as in that of S. Leo to the Council of Chalcedon, which he guided in faith, confirmed, and in part annulled." We have seen already that his "guiding in faith" consisted in the Council approving, after full examination, his Tome on the Incarnation. That Papal confirmation was not thought essential in those ages is clear from the fact that the first two General Councils, from which the Church received the Nicene Creed, were never confirmed at all, as neither did the Pope convoke or preside in them. And as to the decrees of Chalcedon being "in part annulled" by Leo, it is true that he refused to sanction the 28th canon, raising Constantinople to the second rank among the patriarchates, and it is equally true that the canon was received and acted upon uninterruptedly from that day forwards in spite of his refusal. Let us pass from ancient to contemporary history. The Cardinal favours us with a highly sensational account of the appearance of "the work entitled *Janus*" and other kindred works in England, France, and Germany, which those who happen to know anything of the circumstances will hardly be able to read without a smile. We refer to it here for the sake of one truly marvellous assertion. "The fable"—fable is a word which the writer would do well to be chary of recalling—"that the infallibility was to be defined by acclamation was first formally announced in *Janus*." Either the Cardinal had quite forgotten when he penned these words the passage in *Janus* to which he was referring, or he must have reckoned on his readers forgetting it. The passage actually forms part of a long extract from the *Civiltà Cattolica*—the inspired organ of the Holy See—for February 6, 1869. "Catholics will accept with delight the proclamation of the Pope's dogmatic infallibility. Every one knows that he himself is not disposed to take the initiative in a matter so directly concerning himself; but it is hoped that his infallibility will be defined unanimously, by acclamation, by the mouth of the assembled Fathers, under the inspiration of the Holy Ghost." It is added that "Catholics believe the Council will be of short duration, like the Council of Chalcedon," which only lasted three weeks; clearly therefore there could be no time for debating the question of infallibility. We will only add that at that period the contents of every number of the *Civiltà* were regularly submitted to the Pope in person and received his approval before publication. So much for the "fable" of *Janus*, who had, we are assured, "supplied all the adversaries of the Catholic faith and the Catholic Church with a large vocabulary of vituperation, which was copiously directed against both." Many of our readers must be familiar with the book, and they can judge for themselves whether the copious supply is of vituperation or of facts; probably they will be ready to agree with the reviewer in the *Times* that "it is a piece of cool and masterly dissection, all the more terrible for the passionless manner in which the author conducts the operation."

When he comes to the actual conduct of the Council, the Cardinal again finds it prudent to take the bull by the horns, and try his best to make a virtue of what it would be useless to pretend to deny. Our readers may remember the bitter feeling of exasperation roused among the Opposition Bishops by the vexatious and tyrannical order of business arbitrarily imposed on them by the supreme authority of the Pontiff. Their solemn Protests against it may be read in the collection of *Documenta ad Illustrandum Concilium Vaticanum* since published by Friedrich. Of all this Cardinal Manning of course drops no hint, though he cannot have forgotten it, but he airily informs us that "after full discussion and examination of precedents"—not by the Council itself, but the preliminary Papal committee—it was decided that the order of procedure could only be regulated by the same supreme authority "which alone has the power to convene, to prorogue, to suspend, and to confirm the Council, or even to withhold confirmation from all or any of its acts." He does not remind us that the Council of

Trent arranged its order of procedure for itself, as is shown by documents which poor Father Theiner was displaced from his position in the Vatican Library for letting the Bishops see. Still less does he remind us that not one of the ancient Ecumenical Councils was convened or dissolved by the authority "which alone has power" to do so; that at most of them the Pope did not preside either personally or by deputy; and that their giving or withholding confirmation was treated as a matter of indifference. Of course, on the infallibilist theory, "it is an act of his own free will to convoke a Council at all," and he can make what use he pleases of his own passive instrument; had that theory prevailed from the beginning, there would clearly have been no Councils at all. After all that has gone before, the readers of *Quirinus* and *Pomponio Leto* will perhaps be prepared to listen without too broad a smile to the amusing statement that at the Vatican Council "liberty of speech was as perfectly secured as in our own Parliament," in spite of the violent interruption of several speakers by the presiding Legates and the summary closing of the infallibilist debate in the middle by the same authority; though they may be rather perplexed at hearing that—unlike our Parliament—"the obligation of secrecy" was one main guarantee of the "complete independence and tranquillity" of the speakers. If it was really the object of the Curia to guarantee this "complete independence and tranquillity," their wonted astuteness in adapting means to ends appears to have been sadly at fault. And now our readers will be in a position to judge what reliance is to be placed on the accuracy of the statements whether of past or of contemporary history in Cardinal Manning's "True Story of the Vatican Council."

ALBUMS AND BIRTHDAY-BOOKS.

IS the decay of albums a sign that we are less pedantic, or more mentally indolent and prosaic, than our grandfathers and grandmothers? In a corner of the library of most houses a few albums are to be found, a *hortus siccus* wherein the flowers of old flirtations are preserved. On wet days in the country, and in the "wretchednesses," to borrow a strong expression from the Prayer-Book, which wet days in the country beget, people may be found to turn over the ancient leaves, and revive the simpering gallantries of the year of grace 1820. An album must have been indispensable to a young lady in days that knew not the coy familiarities of skating on wheels and the artless merriment of lawn-tennis. Albums brought people together in a semi-confidential way, and to do this was probably the final cause of their existence. There must once apparently have been an age when one young person could ask another to write a copy of original or borrowed verses, within a frame of tinted flowers, or in a stamped design, and when the person appealed to complied with the request. This gave an opportunity for ingenious compliments which, to the relief of one sex at least, is no longer extant. Nothing in the world could now be further from the mind of a girl than to expect an *impromptu* madrigal in which she is to be compared to the violet, the phoenix, or other flora or fauna of fancy or fiction. And the young man of the age, the character who answers to the long extinct Buck or Dandy or Blood, would be terribly put to it if he were expected not only to apell, but to rhyme, in public. The fable of the past was proud of his lines on "two beautiful ponies," or, to go further back, of his *au voleur, au voleur!* and his power of rendering all Roman history into a series of madrigals. The same class of human being to-day is at least perfectly well aware of his inability to turn a line, and boasts that he cannot understand that sort of thing.

Perhaps the decline of albums is a thing which may be regretted by a few very old-fashioned admirers of a talent which is obsolete in England. It is a relief, to be sure, that there is now no danger of one's being asked for "a copy of verses." Every one who yielded to the invitation must have written in haste and nervousness, unless, as is very probable, he composed a few epigrams beforehand, and had them ready in his memory for every opportunity. Then a man's lyric placed him at the mercy of its owner, and he must have known that its main use was to be a peg on which the owner's friends would hang personal criticism. To leave a sonnet behind was to leave one's character to be vivisected. Still the dreaded albums kept up a survival of courtly and complimentary poetry, a faded thing that still retains a good deal of perfume and delicate grace. All the old piping of shepherds and their responsive songs and praises of Amurysilis dwindled down to album-poetry. But monarchs like Francis I. and Charles IX., men of genius, diplomatists, statesmen, have all taken up Corydon's pipe in their turn, and produced a slender strain, a few lines of flattery and rallery. Even within the memory of people not wholly superannuated, some of Mr. Thackeray's lightest and most tender and graceful verses were written in albums, and recalled the days

When I was young as you are young,
And songs were sung, and lutes were strung,
And love lamps in the lattice hung.

Alfred de Musset, as he is represented in the Liography by his brother, was a notable and willing victim of the muse of the album. There is a great deal of bright vivacity in his stanzas, all turning on two rhymes:—

Charmant petit moinillon rose,
J'aimais la fleur à peine déclose,
Charmant petit moinillon blanc,
N'aurait eu pareil compliment.
Je ferais votre apothéose,
Charmant petit moinillon rose.

Poets could afford to make pretty presents of these sketches and caprices, and many men of wit who were no poets could turn compliments immortal as the "Accept a miracle instead of wit." Wit has ceased to be "good form," and the bandying of verses seems nowadays an impossible pedantry. No one will write a lyric to tell a young lady that she has a difficult service at lawn-tennis, or that her back-handed strokes are unimpeachable. The female eye is more likely to be spoken of in terms devised for that of the cricketer than compared to a violet, a sapphire, or what not.

Though albums yielded to the spirit of the age, a kind of degenerate offspring survived them. A very painful device, now happily extinct, aimed at making *esprit* easy. What were called "character-books" combined the spirit of competitive examination with the natural shrinking from any sort of taste or elegance in drawing-room diversions. The victim was expected to answer a number of absurd questions as to his favourite painter, poet, musician, motto, and so on; and the inference was that his character might be recognized from this expression of his taste. The character-book was too unpleasant a form of "intellectual diversion" to last long; moreover, it required some mental exertion, more perhaps than many honest people feel when turning over the leaves of a dictionary in search of the solution of an acrostic. To the character-book succeeded the birthday-book, which, we imagine, was first developed in the atmosphere of evangelical devotion. The idea was to have a text of the Bible, chosen at random, for every day of the year, with a blank space opposite, and the proprietor of the volume requested her friends to sign their names at the date of their birthdays. A feeble little flutter of curiosity could be got out of the chance that the text might seem appropriate, and an earnest person might possibly improve the occasion. To be fond of signing one's name, it has been said, is the mark of an idiot; and the operation is certainly easier than composing verses or remembering the titles of historians and musicians. The birthday-book has thus been rather popular, and its introduction at a suitable moment no doubt stirs the stagnant waters of genteel conversation or gives a fillip to some very languid flirtation. Texts from Shakspeare are even better adapted to the same purpose, and now the Countess of Portsmouth has published a *Poetical Birthday Book*, which may be euphuistically entitled "The Countess of Portsmouth's Arcadia."

Of all devices for retaining a little poetry in the relations of young men and women, while quite doing away with the least need of mental exertion, the *Poetical Birthday Book* is the most ingenious. The process is the same as in other birthday-books—you sign your name and look at the character which fate and the Countess of Portsmouth have assigned to you. Elderly people, say persons above twenty-five years of age, will not often be lucky enough to find a poetic text that applies to them. But young men and maidens may be perfectly certain that they will alight on one of the prettiest things that Shakspeare, or Mr. Robert Buchanan, Miss Meta Orred, or Edmund Spenser can say for them. A young and aspiring person who has had the luck to be born on the 2nd of January is thus impetuously welcomed by Mr. Swinburne:—

O strong-winged soul with prophetic
Lips hot with the blood-beats of song,
With tremor of heart-strings magnetic,
With thoughts as thunders in throng.

But any one whose mind and body are really in the excited pathological condition here described by Mr. Swinburne may be expected to do his own poetry. The verse only gives him a hint, and he will let free his "thoughts as thunders in throng" with a startling effect quite unlike that of album poetry as it used to be. He will be able to address Mr. Swinburne in words which we lately had the good fortune to read in the works of a young singer:—"My pale, strong brother, my sweet-winged brother," "Brother, my brother, my sad-toned brother," and so on, in a very affectionate and thundering style. To select verse for a character of this sort is obviously superfluous. But a gentleman born on January 6th cannot but be gratified at his good chance—

He had eyes as blue as summer heaven.

A lad whose natal day is January 5th, unless indeed he happens to be very earnest, will smile at a line from Mr. Myers, in which he is saluted as "a simple soul, a hammer of the Lord." But, as a rule, youths are expected to be beautiful. A rowing man who saw the light on January 8th will find a compliment waiting on him from the muse of Dr. Hayman:—

And, but that wind, and sun, and sea,
Had scoured his square-set bust with bronze,
Ambrosial fair.

January 24th is a date not less favourable to manly beauty:—"He was a lovely youth I guess"; and, moreover,

When he chose to sport and play,
No Dolphin ever was so gay
Upon the tropic sea.

He who was born on the day fatal to partridges finds a happy quotation from Blake:—

His face is fair as heaven
When springing buds unfold.

If men are so fortunate, it may be guessed that ladies rejoice in all the prettiest posies and jewels new words long that English poetry can afford. Who can ask for better than the fate of the maid or matron whose birthday is August 23:—

Her looks were like a flower in May,
Her smile was like a summer morn.

For August 9th is reserved the best, if there be a best, of Shakspeare's hyperbolic praises:—

You, oh you,
So perfect and so peerless, are created
Of every creature's best.

The ambition of the owner of a birthday-book is to collect the names of three hundred and sixty-five acquaintances. Probably no one ever quite succeeded in this quest. Certainly the happy proprietor of the Bible, the Shakspeare, and the *Poetical Birthday Books*, "in a neat box," must be lucky if she secures a thousand and ninety-five Biblical, Shakspearian, and poetical friends.

The indolent Orientals are known to take pleasure in the dance, but they prefer to have their dancing done for them. They are mere spectators, and flatter themselves that they get all the delight with none of the exertion. Birthday-books appear to be intended to meet the demands of Western indolence. Ladies still like compliments, and poetical compliments perhaps; but it is too hard work for swains and suitors to compose original strains. And, after all, no ordinary amateur can utter such pretty and sweet things as your professional poet. A casual acquaintance might hesitate to say, even if he thought of it, that a lady's "lips, like foxgloves, pink and pale, went sighing like an autumn gale." The expression seems a little strained, especially when we think of "the wild West wind, the breath of autumn's being." But when an accomplished poet, Miss Orred, has supplied this text for October 3rd, then the casual acquaintance may take courage to insist on the beauty and appropriateness of the expression. Again, a lady might falter before telling a friend right out that

A grand uncommon man was he,
Broad shouldered, and of Gothic form,
Strong built, and hoary like a sea—
A high sea broken up by storm.

Between high seas and pointed arches the compliment is a little mixed; but Mr. Joaquin Miller is responsible for the form, while the excellence of the intention is or ought to be credited to the lady who possesses the birthday-book. One thing leads to another, and one compliment to a series of sweet things, and thus birthday-books may come to be regarded as marriage-books. At the least, less lucky lovers may say, "*Galeotto fu il libro e chi lo scrisse*," of course giving a perfectly proper sense to the quotation. Perhaps when young people come to find out that pretty verses with a personal application are pleasant, they may even desert the "awfully jolly girl" style of compliment, and return to a more prim but more pleasing euphuism. They may pass through the Arcadia of the Countess of Portsmouth to that of the Countess of Pembroke, and find something to like in the grace of old-world gallantry.

MODERN PARLIAMENTARY DUELLING.

WHETHER it is owing to the weather, or the state of parties, or some other mysterious and wayward influence, it is hard to say, but at the present time there is evidently an unusual degree of electrical excitement in the Parliamentary atmosphere. Some people may be tempted to say that it is all Mr. Gladstone, but that would perhaps be going a little too far. It is evident, however, that the great exponent of the age has lately shown symptoms of being highly charged with explosive caloric, and has in fact been letting off sparks, and giving shocks to unfortunate persons who have happened accidentally to come in contact with him. Of course Mr. Gladstone, on the other hand, may naturally hold that this is not his fault, but only the fault of the bungling people who do not keep clear of him. However that may be, it would certainly seem to be becoming necessary to make some provision in the way of a reserve chamber or safety-valve for letting off the dangerous ebullitions of political ill-temper which have lately been witnessed. There is nothing new in the use of hard words or strong epithets in Parliamentary debate; but in other days, when the limits of conventional courtesy were exceeded, there was a very simple expedient by which members who had got embroiled were able to settle their disagreements without troubling anybody but themselves. An early meeting was arranged on some quiet suburban common, with a surgeon in attendance, and there was an innocent interchange of shots, which gave the medical gentleman very little to do. Any one who is familiar with Parliamentary history could mention several well-known cases of the kind, such as those in which Lord Londonderry and Mr. Grattan and Lord Powerscourt and Mr. Roebuck confronted each other; and even the most mild and peaceful of public men have had occasionally to take the field. Indeed only a few years ago a hostile meeting was advertised in the papers as certainly going to take place at Boulogne between a doughty Irish chieftain and another Irish member of Parliament; but, on cool reflection, they became perfectly reconciled, and abandoned all bloodthirsty designs, one declaring that he meant no personal reference in the unpleasant remarks he had made, and the other repudiating any intention to sneer at an ancient family. It is satisfactory to think that there has been, as a rule, a happy absence of injurious results in this system of vindicating political honour, the usual finish having been either that shots were harmlessly exchanged, or that an explanation was amicably arranged by the seconds. The great advantage, however, of this method of settling disputes was that, though it was no doubt very uncomfortable for the persons immediately concerned to have to get up at an early hour, and probably without much appetite for

breakfast, it did not disturb or waste the time of the assembly to which the combatants belonged, and merely provided a little agreeable social scandal. What used to be called "personal satisfaction" in this fashion has now passed away; but it is evident from some of the debates during the present Session that the source of such encounters exists quite as much as ever, and is even embittered in certain respects by the comparative absence of responsibility for strong language. Expressions have been very recently used, not, in all cases, actually in Parliament, but having reference to Parliamentary matters, which in the last generation would certainly have led to a quiet visit of the parties involved to Wormwood Scrubs or Putney Heath in the dim morning light. The venom of political distemper is still secreted; but the ensuing battle is now fought out in another way. The plan which Mr. Gladstone, in his practice of universal benevolence and humanity, wishes to introduce is that any one who thinks he has been misrepresented or insulted, instead of inviting his supposed aggressor to a private meeting with pistols, should call him names and impute disgraceful motives to him in the newspapers.

We have already had some illustrations of the working of this system. As soon as the Turkish blue-book was published, Mr. Gladstone seems to have been thirsting for an opportunity of binging Sir Henry Elliot to book for an incidental remark in one of his despatches from Constantinople. Sir Henry, in pointing out to the Government at home that it was a mistake for people over here to go out of their way continually to abuse and menace the Turks at a moment when it was of importance to the general interest, not only of England but of Europe, that they should be brought under the influence of friendly advice, had referred to personages in England "whose language had created a mistrust of us among the Turks, and a belief that they wanted their expulsion from Europe." Mr. Gladstone questioned the Government on the subject in the House of Commons, and learned, as he expected, that he was one of the "personages" included in this category. Thereupon he wrote a letter to Sir H. Elliot demanding to know on what grounds the assertion was made. The passage, he said, touched "a fact, not an impression or belief, but a fact," which was that certain persons, of whom he found he was regarded as the ringleader, had made a particular declaration. Now, as a matter of fact, Sir H. Elliot, although Mr. Gladstone's pamphlet was in his mind at the time when he wrote the despatch, did not mention him by name, and did not impute to him that he had positively proposed that the Turks should be driven in a body out of Europe. All he said was, that certain personages (of whom, no doubt, it was obvious that Mr. Gladstone was one) had used language which created an impression on the minds of the Turks that there was a feeling in England of the kind described. It is notorious, in fact, that the language which Mr. Gladstone had used included a savage denunciation of the Turks as the "anti-human specimen of humanity," and it was, of course, supposed that so skillful a writer as Mr. Gladstone, if he did not mean to go to the full extent of that expression, would have been careful to guard against the natural and inevitable apprehension of his meaning which his language actually produced, not only in Turkey, but in his own country. In his reply Sir H. Elliot stated that he did not refer to Mr. Gladstone as recommending the total expulsion of the Turks from Europe, but that "this had been distinctly advocated by others"; and added, "Although you, who are certainly the most important person who had produced the impression I was describing, explained that you only proposed that all the civil and military and police authorities should leave the country, this proposal was looked upon with the same feelings as the more sweeping one, and equally contributed to create a distrust in us as friendly advisers of the Turks." This was a very mild and cogent answer, and ought obviously to have settled the question. But Mr. Gladstone's temper was roused; and he would not be contented without a personal hit at Sir H. Elliot. He therefore, without the slightest foundation in fact, and entirely out of his own fancy, assumed that "you"—that is, Sir Henry—"charge upon me (and this is all you can do) the idiotic proposal that the civil and military servants of the Porte should be corporally ejected from Bulgaria, without any provision against their going into Macedonia or Thessaly, or other neighbouring provinces of Turkey." Now any one who looks at Sir H. Elliot's letter will see that it was confined strictly to the fact that certain language used in this country had produced certain impressions abroad, and that he did not enter into any subsidiary question. The irrelevant and also rude remark of Mr. Gladstone "that is all you can do," and his insinuation, for it was nothing else, that Sir Henry had formed an "idiotic" conception of what he had said, of course released the Ambassador from the necessity of further discussion.

In another case Mr. Gladstone has also indulged in very serious and unmeasured imputations on the honour and good faith of a member of the House of Commons. In the late debate on the Eastern question before the holidays Sir H. Drummond Wolff quoted some passages from former speeches by Mr. Gladstone as reported in *Hansard*. Mr. Gladstone had already spoken, and could not rise again on the same question; but he was present when the quotations were read, and asked and obtained references in regard to them; and he might have made a reply either on one of the numerous motions for adjournment which occupied the House till the dawn or at the sitting on Monday. What he preferred to do was to send a letter addressed to Sir H. D. Wolff, which the latter was surprised to read for the first time in the papers. It is true that this was owing to the letter having been wrongly addressed, through an error in a

directory; but most people will be of opinion that the etiquette of good society requires that, if the receipt of an important letter is not immediately acknowledged, inquiry should be made as to whether there may not have been a failure in transit; and Mr. Gladstone ought certainly to have waited to ascertain this before giving the letter to the world. In this document he accused Sir H. D. Wolff in the strongest and most express terms of having made a garbled citation of the passages quoted. He also imputed that Sir Henry had purposely seized the opportunity of criticizing his opinions, because "you knew that I could not reply to you"; although, in point of fact, Sir Henry had no chance of any earlier opening. It should be observed that in making this attack Mr. Gladstone misrepresents what his opponent said in just the same way as in Sir Henry Elliot's case. He complains that Sir H. D. Wolff "conveyed an impression that he had laid down some general doctrine that humanity was to be set aside whenever it came into conflict with neutrality." As far as we can see he did nothing of the kind, but simply quoted with literal accuracy from an authoritative record two opinions which Mr. Gladstone had certainly expressed at the time and on the subject specified. To say that it is "garbling" not to read a whole speech through when only certain parts of it are in question is of course mere nonsense; but it unfortunately shows the spirit which Mr. Gladstone introduces into controversy. Nor was this all; for he went on to preach a homily on the offence or crime of what he attributed to his adversary, remarking that "every day he passed by fictitious charges in silence"—a very broken silence—"but in the case of a member of Parliament speaking in his place, I think it is a public duty to protest against the use in any style of warfare, however poor, of the method of garbled quotation." There was another complaint which Mr. Gladstone brought forward, and that was that it had been hinted that he was looking for office when he spoke in a certain way—a view which he contradicted; but, as a matter of fact, Mr. Gladstone was at that time, not having then renounced the essential obligations of political life, in such a position that the prospect of having to take office must have been constantly before him; and indeed he was in office very soon afterwards. Having been treated in this way, Sir H. Drummond Wolff thought himself entitled to make his explanation in the House, and as his speech had been made there, he had of course a right to defend it in the same place. Mr. Gladstone disputed the principle, which he assumed to have been laid down, that in such a case when a challenge was made there should be an opportunity of then and there replying to it; but, under certain conditions, this is reasonable enough. No doubt it is a pity that valuable time should be spent on personal issues of this kind; but the fault is with those who unnecessarily raise them.

Then, as if his hands were not full enough already, Mr. Gladstone has rushed into type once more about his grievances. It seems that, in a recent public address at Brighton, Mr. Ashbury had paid him the very high compliment of supposing that his popularity as a writer was such that his pamphlets on the Eastern question had brought him in 10,000*l*. It is true that Mr. Ashbury very improperly suggested that it was with a view to profitable commerce of this kind that Mr. Gladstone had engaged in his extraordinary agitation; but still Mr. Gladstone might have endured this reflection, which could hardly have been seriously made, in consideration of the handsome estimate of his tremendous literary influence. Probably he will be satisfied now that he has exposed the fable. If, however, the eminent but pugnacious statesman is to establish a regular system of doing combat with any opponents he can find, like an Irishman at Donnybrook, a rather dismal prospect is opened for readers of the newspapers, should editors be weak enough to go on giving him space for venting his peculiar humour. Considering the looseness and vagueness of language in which the most voluble of orators is in the habit of indulging, and the extreme difficulty of forming a distinct idea of what he exactly means, it may be expected that he will have abundant opportunities of personal controversy. His explanations in regard to Mr. Odo Russell's mission to Versailles will be remembered as a remarkable example of the sort of extraordinary mystification to which he is apt to resort in cases of difficulty; and the stories which he told at a recent meeting of the Serbian Relief Fund as to what he saw of Turkish atrocities during a hasty visit of an hour or two to the Albanian coast many years ago, and which have been disposed of by Sir P. Colquhoun, are another instance of his loose talk. It is very hard, however, that the public should be bothered with these unpleasant and undignified exhibitions either in Parliament or in the newspapers; and the best plan would be for Mr. Gladstone to establish an organ of his own in which he could deal periodically with all his antagonists. People would then know what to expect, and could read as much or as little of this sort of thing as suited their tastes.

THE AMERICAN SILVER COMMISSION.

LAST year, while the panic caused by the fall of silver still prevailed, and shortly after the Report of Mr. Goschen's Committee had appeared, the United States Congress appointed a Commission to advise the Government on the resumption policy to be pursued in view of the change that had taken place in the relation of the precious metals to one another. This Commission has now presented to the Senate two Reports

—one signed by five members, the other by three. The Reports themselves have not yet been received in this country, but the substance of them has been made known, and very remarkable documents they appear to be. It will surprise nobody to be told that the majority recommend a return to the double standard. The constitution of the Commission made this inevitable, and the only wonder is, not that they have so reported, but that the minority hesitated to agree with them. Senator Jones of Nevada, the Silver King as he is nicknamed, the greatest mine-owner in America, and representative of a State whose wealth and importance are derived from its ores, is the leader of the majority. Without attributing to him any unworthy motives, it would be strange indeed if he did not desire to see a silver currency adopted. The argument, however, by which he and his friends support their recommendation is one of the most extraordinary ever put forward in a grave public document. Briefly, it is that the universal commercial depression which has prevailed for nearly four years is due to the demonetization of silver in the United States in February 1873, and in Germany in the July following. To expose the amazing ignorance or audacity of this statement it is enough to remark that the United States have suffered perhaps more severely than any other country from the depression, and that the money of the United States in 1873 was not silver, but inconvertible paper. The demonetization could, therefore, exercise no influence on prices, as they were not calculated in silver. It is hardly necessary to say that the depression is the consequence of the over-speculation and wild financing of the couple of years that immediately followed the Franco-German War. The recommendation of the majority of the Commission, however, does not depend for its chances of success on the arguments on which it professes to be based, but on far more powerful circumstances. We all know the influence exerted by "Rings" in the United States on the action of Congress, of the State Legislatures, of the Federal and State Administrations, and even of the courts of law, as well as on the course of public opinion. Now the Silver Ring of which Senator Jones is the head is by no means the least powerful of these peculiar products of American public life. Then, again, the protection of native industry has an extraordinary hold on the American popular mind, and silver-mining is a very valuable American industry. Further, the double standard was the old American system, only given up so lately as four years ago. It has, therefore, still in its favour the strong Conservative tendency of the unlearned public. Lastly, it would be practically easier to resume specie payments with a silver coin than with a gold currency. The business of the reasoning by which the recommendation of the majority is supported will hardly, therefore, exercise much influence on the ultimate decision. Nor is the Report of the minority of the Commission better deserving of regard. Of the minority Senator Boutwell, President Grant's former Secretary of the Treasury, is the principal member. And the document to which he sets his name is also favourable to the remonetization of silver; but it recommends the United States Government, before acting on its own account, to propose a convention to the European Governments for the purpose of establishing a fixed relation of value between silver and gold. Until this convention has been held, the authors of the minority Report are of opinion that there would be no harm in allowing the American currency law to stand as it is. It is hardly worth while to criticize so childish a recommendation as this. It is perfectly evident that our own Government would take no part in the proposed convention. We have a monetary system which experience has proved to be the best attainable under existing circumstances, and to change it is totally out of the question. The German Government, which has been at such extraordinary expense to provide a gold coinage, is just as little likely to undo what it has done at the suggestion of the American Government. The most, therefore, that could be achieved would be a convention with the Latin Union and the United States, but not so valuable as to make it advisable to postpone the adoption of the double standard until after resumption, if the double standard is to be adopted at all. For, were resumption once accomplished, the case for the double standard is gone.

It is, however, a work of supererogation to convict American public men of ignorance in financial matters. It is of more interest to inquire what is likely to be the result on the price of silver, and on the exchanges of the world, in the event of the Report of the majority of the Commission being adopted by Congress. The causes of the late violent fluctuations in the value of silver are twofold—an extraordinary increase of the supply and an exceptional decrease of the demand. Any modification of either of these causes is immediately felt by the market. We have had illustrations of this during the past few years. In 1870 France suspended specie payments, adding the most important name to the long list of States under the *regime* of inconvertible paper. Immediately there set in a downward tendency in the price of silver. The next year Germany decided to demonetize silver and adopt a gold coinage. For a while the effect was checked by the payment of the indemnity. But with 1873 the fall in silver began to be serious. And the fall was aggravated by a decrease in the exportation of silver to the East, and an increase in the bills drawn by the Secretary of State upon India. Lastly, very rich silver-mines were discovered in Nevada, and rumour magnified their productiveness. Owing to these various causes silver continued to fall, until at one moment last July the

price actually sank to forty-seven pence per ounce. But now a reaction set in. The German Government refused to sell its surplus silver at such a price, and the American mines yielded only about 7,700,000*l.* worth last year, instead of the minimum of nine millions estimated by Mr. Goschen. In consequence the actual supply in the market began to run short. At the same time the India Office, alarmed at the effects of the fall on its own finances, reduced as much as possible its drawings upon India; while the depreciation acted as a check upon the export trade from Europe to India, and as a bounty upon importation thence—so much so indeed, that it was found profitable to bring wheat from Bombay to London through the Suez Canal. The consequence was that silver began to flow to the East to pay for the goods sent here. Then came the failure in the European silk crop, of which we spoke last week, and the consequent demand for Chinese, Japanese, and Indian silk, which stimulated the drain of silver eastwards. And the failure in the sugar crop had the same influence, though to a very much slighter extent. Lastly, the American Government began to prepare for resumption by the coining of eight millions worth of silver to replace the small currency. To the surprise of every one, it was found that the agents of the Treasury had to come to London to get the required amount of silver. The price then began to rise as rapidly as it had fallen, and in January, last it had actually reached fifty-eight pence. The German Government thought it now saw its opportunity to dispose of its old silver. Instead of acting cautiously, however, it threw a large quantity on the market, and the price instantly went down again. Then came the Indian Budget, in which we were told that a loan in London was contemplated, that is, an increase of the home charges, which already so seriously aggravate the difficulty; and also that the Secretary of State's drawings would be on a larger scale than ever. The fall became accelerated, the price this week being between fifty-three and fifty-four pence. Thus we have had an unprecedented fall, followed by an equally rapid rise, and that again by a fall almost as rapid as the first, according as the demand or supply preponderated.

It is evident from what we have said that the chief disturbing cause is the unknown amount of old silver which the German Government has for disposal. This is a constant source of apprehension, for no one knows how soon political necessities may compel its sale in a quantity that would break down prices. Otherwise, the supply is not very much in excess even of existing demands, as was seen in the latter half of last year. Now, if the United States adopt the double standard, they will coin much more silver than gold, and thus will meet the stock which Germany wants to get rid of. The indirect results of such a measure would be scarcely less important than the direct. France, as M. Leon Say has told us, is watching the course of events to be guided by them whether she will retain the double standard or reject it. If the United States return to it, France will probably make no change. Certainly Italy and Austria will not. For two years running successive Ministers of Finance have assured us of the eagerness of the Italian Government to resume specie payments, and the near prospect of an equilibrium between income and expenditure makes this policy practicable. The Austrian Government is equally earnest in its professions of the same desire. If, then, the United States remonetize silver, we may be sure that Italy and Austria will not demonetize it. Thus we have the prospect in the near future of four of the great Governments of the world re-adopting silver as a legal tender. This circumstance, should the report of the Commission be approved by Congress, will remove the impression made by the demonetization in quick succession by Germany, the United States, and Holland. As for the effect on the exchanges, it would be to lessen the frequency and severity of monetary crises. During the past quarter of a century gold has been becoming the sole medium of international exchange—the means, that is, by which the debts of nations to one another are settled. At the same time the production of gold has of late been falling off. Were all the commercial countries to adopt a gold standard, gold would therefore become scarce and dear, just as silver would lose a great part of its value. But if the United States adopt the double standard, and if the example is as fruitful as we should expect, this danger would be avoided, and the great banks, such as those of England, France, and Germany, would not so often be obliged to disturb trade by raising the rate of discount simply to prevent a drain of gold.

To the world at large, then, the adoption by the United States of the majority Report would be an undoubted advantage. It would save the Indian Government from a disaster scarcely less serious than a famine; it would relieve the German Government from a very serious difficulty; to France also it would be serviceable in a way that will presently be seen; it would steady prices in the silver countries—a most desirable consummation; and it would prevent monetary crises from becoming more frequent. But whether it would be equally advantageous to the United States is more than doubtful. Unquestionably it would be easier to resume specie payments with silver than with gold. At the present moment, in fact, greenbacks are much nearer the value of gold than silver is. Consequently, there would be no loss in resumption. This is, of course, a powerful recommendation. But, on the other hand, all experience proves it to be impossible to maintain a fixed ratio of value between gold and silver. One might as well attempt to make the price of wheat or of iron unchangeable. The consequence of adopting a double standard is that when the value of one of the metals rises that one is exported, and the country is left with only the depreciated metal. Thus at the be-

ginning of this century the United States set a higher value upon silver than France did; it was found profitable, therefore, to pay in silver only in the United States, and to export the gold to France, where it was worth more. The consequence was that, although both countries had the double standard, gold alone was in circulation in France, and silver alone in the United States. Afterwards this state of things was reversed. No doubt this particular danger might be guarded against by Mr. Bontwell's proposal that all nations using silver should adopt the same ratio of value. But an agreement of this kind would not prevent another form of the same risk. If the Nevada silver mines are as rich as they are said to be, and if the production of gold does not increase, in the long run gold will become dearer. It will in that case be to the advantage of all persons who have payments to make in the countries where silver is a legal tender to make them in silver; they will obtain a full discharge of their debts by using the cheaper metal. But this cannot be done where gold alone is legal tender. Therefore, the countries of the double standard will retain silver for their home use, and export gold. The result is precisely the same as in the case of an inconvertible paper currency, and the inconvenience would be similar. But now, if the growth of trade in the East were to make silver the dearer metal of the two, silver would be exported thither, and gold would flow back to the double standard countries. Thus these countries would always retain the depreciated metal, and would further be frequently changing their money, so that a man who had to let land for, say, a thousand dollars a year, would never know whether he would receive gold or silver. Such are the disadvantages to the United States to be set against the greater facility of resumption in silver, and they explain our previous remark that it would be a benefit to France were the United States to adopt the double standard. For, by sharing the burden, they would make it lighter; and, further, by extending the area of fluctuation they would lessen its violence.

PUBLIC SCHOOL MAGAZINES.

SOMEWHERE within the shadow of an English cathedral is sure to be found a nest, or den, which has been built or adapted for himself by the collecting bookseller of the county. He is not accustomed indeed to describe himself by this name; but there is a certain unloveliness of association and general odour of Houndsditch attaching to the more usual "second-hand" which makes that designation as unsuitable in literature as it is acknowledged to be in art. Second-hand books unhappily abound, and none the less that they may be popularly supposed to be new, and may shine in very gorgeous raiment; but these are not, and are not likely to be, in the line of the collecting bookseller. He does not affect plate-glass, and he has no room for a counter. The shape of his shop, whatever it may be, is undiscoverable by the visitor, who is confronted by barricades of books at every turn, with intricate passages between; while in a corner behind an old desk, upon which appear a waste-book and an inkstand, the visitor will be fortunate if he finds the proprietor, who is just as likely to be represented by a small boy in his own absence at an auction twenty miles off. He has a very keen eye for such auctions at old halls or rectories as may be worth attending; and at more than one of these he is fairly certain to have picked up an octavo in the substantial calf of the last century, well got up and carefully preserved by its original owner, which ought not to remain forgotten on his shelves while the library of any public school in England is without it. For almost every public school of importance has now its school magazine; and the whole race of these vigorous and lively periodicals traces its origin, directly or indirectly, to the *Microcosm*, the "Spectator" of Eton, whose brief and brilliant career was comprised within the limits of a single school year in 1786-7, closing apparently when its editor and chief contributor, Canning, left Eton for Oxford, where two years later he obtained, at barely nineteen, the Chancellor's Prize for Latin verse. The type of Eton boys who, in association with Canning, produced this singularly interesting series of papers, is reproduced in the members of modern sixth forms, by whom, as we have reason to believe, the editorship and literary conduct of the school magazines is carried on, and who are for the most part the prizemen and scholarship-winners of their schools. It is curious to trace the similarity in many points between the character of the contents of the last-century magazine and that which is exhibited by its successors; while in one important particular the *Microcosm* essentially differs from them. They are chronicles, or newspapers, relating current events of interest in the school community, and full of personal details of what may be described as of a public nature in relation to that community; whereas on all these points the *Microcosm* is entirely silent. Not a single name appears throughout the whole series of papers, except in the quaintly-conceived "Will" of Mr. Gregory Griffin—the editorial pseudonym—in which the authorship of all the chief writers and of some of the minor contributors is acknowledged. Nor does the *Microcosm* supply the slightest information as to the games of Eton at the time, which appear to have been thought beneath the notice of the editor and his staff. This is an omission which gives great cause for regret; though perhaps it is even too abundantly compensated in the representative journals of the present day, which in this respect tend rather to an overwhelming minuteness of statistical detail. Amidst the general and hearty

interest which the arrival of the school magazine excites "at home," it is difficult to give a very sustained attention to the "analysis of the bowling" in a hard-fought match, or to the "batting averages for the term" achieved by the Eleven and the Twenty-two. Still, for historical purposes, this is the more satisfactory extreme; and it is a little provoking to get but a more glimpse of Eton cricket, and apparently of the "professional" type of the time, vanishing in an instant, and leaving a trace scarcely perceptible; as we read that "the cricketer will, in poring over a page of Horace, lose the trophies which await him as hero of the Hampshire, and bulwark of the White Conduit; and exchange the invigorating commendations of a Small, Shock White, or Lumpy, for the dull drudgery of blundering through ten long years of scholastic labour."

The number of public school magazines or journals now regularly issued is considerable, and the lists of "acknowledgments" published in those to which we have been able to refer show both that America is not behind the old country in the matter, and that the merits of Transatlantic Microcosmopolitans are heartily recognized by the boy-editors of our English schools. As a rule, the titles of the home publications follow the names of their respective schools, the few exceptions having doubtless a well-understood local significance, but requiring some explanation to bring them to the level of popular intelligence. The *Meteor* flashes from Rugby; the *Ouse's* nest we should conjecture to be not far from Bedford; and the writers in the *Uda*, we may be sure, take care to provide the promising scholar-freshmen whom they send up in force to the Universities with a somewhat wider knowledge of the greater world than was possessed by an ingenuous youth who came to Oxford in the days when every right-thinking undergraduate was Protectionist to the backbone, and who complained bitterly of the unjust and unreasoning outcry which he heard on every side against the "Manchester School." The title of one magazine calls indeed for some serious remark. The boys of the school from which it issues are not the only inhabitants of the suburb whose name it bears; and the eminently respectable gentlemen who daily betake themselves thence in decorous procession to the city, and whose influential support is so highly prized by all religious and charitable institutions, ought not to be ticketed behind their backs with the inappropriate, if irresistible, designation of the "Black Heathen." The interchange of these journals, for which the book-post gives facilities, serves almost as an invitation to criticism of each other; and upon this very thin ice an occasional venture is made, although some of the editors more prudently avoid it as dangerous. Its practice is perhaps to be encouraged as an early exercise in literary courtesy, since no class of writers can be more sensitive to pain, or more unwilling knowingly to inflict it, than the young editors of these magazines. Standing, not by any means "with reluctant feet," where the school stream is almost merging in the current of active life, they have not yet reached that callous indifference with which maturer critics can stand the line which they are ready to return; while, on the other hand, they have left behind them in the lower forms the rough-and-ready method which once had sufficed for all cases, but which would not, even if it were now available at all, meet the case of an absent and invisible opponent—"Will you fight?" The more cautious editor who abstains from literary comments on his contemporaries cannot always avoid the dangers thus attendant on criticism, since he must necessarily depend very much on the "swells" of the Eleven and the Twenty—or is it to be the "Fifteen"?—for his graphic narratives of games. He has full liberty to relate how the winning hit in a house match was made by Smith, "who in his well-known style hit a rather wide off-ball of Brown's away to square-leg for five"; but woe to him if he prints any descriptions of this nature in his report of a foreign match. The upper forms of our own day have at least one characteristic in common with their predecessors of the *Microcosm*: outside their own privileged circle they cannot endure to be chafed. One of the most life-like of the *Microcosm* papers evidently owes much of its force to some personal experience of the writer on this point; although the description of the Eton boy's miseries during his annual Christmas visit to the "waggish" North-country squire may well have been coloured by Canning at sixteen with some exaggeration in other points than in the Squire's orchard-robbery story "when he was just about my age," which the writer asserts that he had heard verbatim "for fourteen years" in succession. In the "little world" of the public school, satire, often of a very severe kind, was permissible and was freely practised then, as it is now, although its personal application to individuals was, and is, carefully avoided. Probably within the limits of the school the leaders of an objectionable set, or the most conspicuous supporters of a snobbish or offensive practice, may recognize their own features and know that others will recognize them also; but not the faintest personal allusion is allowed even in these cases to appear; and the objects of the satire are most likely too well pleased with their own performances to feel very much offended by the notice. But in this way the boys are able to bring public opinion to bear on folly and bad taste, or even on the incipient germs of vice, by the use of ridicule or plain speaking which they would not tolerate if it were adopted by their superiors. The first article of the *Microcosm* succeeding the introductory paper is an admirable instance of an attack directed with equal force and courtesy against the then fashionable practice of "swearing." This is by Canning; while one of his fellow-workers, Mr. Robert Smith, is equally happy in his assault in the following number upon the

"loungeurs" or swells of the time, who called themselves "Bucks," and cultivated idleness and "apathy" as one of the fine arts. In this paper the character of the "languid swell" of our own day is anticipated with amusing fidelity; while the "swells" conceit, and the exceptional instances of rudeness and discourtesy towards ladies which occasionally draw down upon him the rebuke of the modern artist's pencil, are attacked in as pointed a manner by the unknown author of the letter in No. XIV., bearing the signature of "A Mortified Country Girl." Papers such as these are often found to have their parallels, adapted to the altered circumstances of our own day, in the school magazines; and various other points of resemblance will occur to any one who compares their pages with those of the old Etonian volume. If Mr. Gregory Griffin "displayed his critical abilities" in a "Critique on the Heroic Poem of the Knave of Hearts," we have seen the more modern science of historical criticism applied in a manner which would have drawn forth hearty approval from Mr. Canning in an exhibition of connected biographies of "Caius" and "Halbus" obtained from the fragmentary incidents of their lives preserved in Latin exercise-books, with an excursus on the moral character of each, which appears in both cases to have been of the nature known to Aristotle and the United States as "mixed."

A school magazine must, from the mere fact of its existence, be liable to suspicion from two opposite points of view; and it is very much to the credit of the conductors of these publications that their course is so skilfully steered—perhaps we ought to write "coxed"—as to avoid both the Scylla of breach of discipline and the Charybdis of being distrusted as a disguised police. They have thus far succeeded in securing the confidence of the executive and the constituency alike. A censorship of the press may at times have been rather indicated as a possibility than threatened as a measure, when the discussion of school practices has approached the confines of criticism upon school rules; but the complete understanding, or rather the intimate association of mutual regard, which prevails between Head-Masters and their sixth forms renders any strict regulation on this subject unnecessary, and the boys keep themselves within bounds. From the opposite side the suspicion which might attach to the magazine as a mere instrument of the school authorities is avoided by the acknowledged practice of inviting contributions from the junior Assistant-Masters, who criticize and are criticized as frankly in the columns of the school journal as at the meetings of the School Debating Society. The pages of the *Microcosm* convey no suggestion that its publication was viewed with disfavour by the Eton authorities, or that any danger to the somewhat more despotic system of school government then prevailing was apprehended from it; but the suspicions of the school constituency on the other side appear to have been excited, and were answered in a frank and manly note by Mr. Canning. Referring to "an opinion lately disseminated by some people" "that the *Microcosm*, previous to its publication, is subjected to the criticism of my superiors, or, in their own words, looked over by Ushers," he declares "the idea" to be as "false in information" as it is "unclassical in phrase." "Slaves cannot live in England; Ireland enjoys an immunity from toads; in a similar degree is the climate and constitution of Eton utterly unadapted to the existence of 'Ushers.'" This spirited reply concludes by "assuring the public that, little as may be the merit of these compositions, they are not 'ushered' into the world by those who are degraded by the supposition—the Assistant directors of Eton education"; and it anticipates with perfect exactness the universal and indignant protest of the public schoolboys of our own time if by any chance the obnoxious term of "Ushers" is applied to the Assistant-Masters. It is not to be expected that schoolboy poetry should rise to a very high degree of excellence, and it does not appear that the lapse of a century has made any perceptible alteration in the general level; but in more than one of our modern public school magazines occasional verses have appeared which suggest a hope that their authors may not, like the writer of the simple and touching lines of "Etonensis" on "taking leave of Eton" in 1787, remain to readers in the future "unknown."

OVERCROWDING.

A DISCUSSION of the kind which is usually reserved for the recess has been going on for the last week in the *Times*. The progress of the clearances made under the provisions of the Artisans' Dwellings Act has lately attracted some notice, and this perhaps has suddenly reminded a large number of excellent persons that there is a great deal of overcrowding in London, and that they cannot take the credit of having done anything to bring it to an end. Accordingly they at once dis-burden their consciences in that convenient substitute for confession, a letter to the *Times*, and at a season when there is nothing to write about but the Eastern question, and when everything there is to say about the Eastern question has been said many times over, this is as good a way of filling up space as any other. Now that Parliament has again met, those who have been behindhand with their contributions will find that the importance of the subject has grown suddenly and strangely less. They may cheer themselves with the reflection that the Whitsuntide recess is only six weeks ahead, and that, unless a war has broken out in the interval, the same lack of matter will produce the same readiness to print whatever comes to hand.

Amidst the various suggestions evoked by the discussion, there are one or two that are really astonishing from their simplicity. The suffragan Bishop of Guildford proposes to cure overcrowding by building houses for the poor of London and other great towns at the cost of the State. He admits that the expense would be "enormous"; but then, he says, "the object is one which hardly admits of the consideration of the expense." It is to be feared that this is not a point on which he will find many ratepayers ready to agree with him. The Metropolitan Board of Works has not shown itself over-eager to incur the outlay entailed by mere clearance of sites for others to build on, and if it were proposed to extend the principle of the Artisans' Dwellings Act to all houses which are either unfit for decent habitation or, at all events, for decent habitation by the number of persons now living in them, and if in addition to this it were proposed to throw the cost of building as well as of clearance on the rates, there would be a small revolution at the next municipal elections. The Bishop of Guildford must be supposed, therefore, to contemplate throwing the burden on the Imperial, not on the local, Exchequer. In that case the Chancellor of the Exchequer might bid farewell to all his projects of paying off the National Debt. He would certainly have to contract a very large new loan, and the additional interest he would have to provide for would pretty well dispose of his Sinking Fund. The Bishop of Guildford looks forward to an adequate return to the State in the shape of diminished pauperism and crime. But, however certain the eventual harvest might be, there is no question that the seed would have to be paid for out of borrowed money.

Sir Francis Peck sees plainly the extravagance of the Bishop's proposal; but, lest he should be puffed up by his own superior wisdom, he is allowed in the same breath to make a still more extraordinary suggestion of his own. He proposes to make the act of permitting overcrowding a penal offence, and to hold both the landlord and the head of the family responsible for allowing more than a proper number of persons to inhabit a house or a room. The discovery whether a given house or room had more than its proper number living in it would, of course, be a matter for inspection. Every room inhabited by the poor would have the amount of its accommodation determined, and it would be the business of the Inspectors to take care that no room ever contained more than its regulated number of inmates. Sir Francis Peck argues that this would involve no undue interference with the liberty of the subject, since it is the duty of every Government to protect the community against acts on the part of individuals which involve public danger. This is true no doubt as a general principle, and provided that Parliament were ready to pass such a measure, and that landlords and tenants were ready to yield obedience to its provisions, there might be no objection to dealing with overcrowding in the way Sir F. Peck suggests. The only thing to be said is that in so submissive and well ordered a community there would be no need for laws against overcrowding. A mere hint from the authorities would be enough to suppress it. But, as applied to a population such as that among which overcrowding is common, such a law would be altogether impracticable. It would be impossible to pass it through Parliament, and, if passed, it would either remain a dead letter, or it would be repealed as soon as any attempt was made to enforce it. To compel landlords to take stock, as it were, of the domestic arrangements of their tenants would be to lay on them an intolerable burden. Such a system would convert every landlord into a policeman in plain clothes, whose conclusions would in their turn be checked by another policeman in plain clothes in the shape of the Sanitary Inspector. One or other of these officials would have to be invested with unlimited authority to enter any room at all hours in order to ascertain how many inmates it contained. It is usually at night that overcrowding takes place, so that to give an Inspector this power during daylight only would be of no avail. He might have the best reasons for suspecting that there were more persons habitually sleeping in a room than the law allowed, and yet be wholly unable to produce any proof of it. But to give any body of men the power of forcing, or even of demanding, an entrance into any rooms which they might suppose to be overcrowded during the hours when the inmates were ordinarily sleeping there, would be to establish an inquisition such as would not be tolerated in the most despotic country in Europe.

The truth is that overcrowding can only be cured on a large scale by the employment of very gradual means. So long as lodgings are scarce, and rents large, and the standard of living low, there will always be those who are willing to be overcrowded in consideration either of paying a lower rent than they would pay for a room of their own, or of receiving that lower rent, and so finding it easier to answer the demands of their landlord. If the tenants of the most overcrowded court in London could be at once planted in new and roomy houses, their first notion of utilizing the additional cubic space would be to take more lodgers. It does not follow that no good would be done by giving them better dwellings, because habits of decency are in a great degree the creation of custom, and in proportion as their standard of living became higher, they would be less disposed to fall conspicuously below it. Indirectly, therefore, improved accommodation does tend to check overcrowding; but any one who imagines that there is nothing to be done except to build better houses, and that then overcrowding will thereupon cease as a matter of course, will be greatly disappointed. The only means by which anything like an immediate cure can be applied to overcrowding is by the personal influ-

ence of particular landlords. A landlord is not obliged by law to let his houses, and if he chooses to do so, he can undoubtedly impose on his tenants whatever conditions he thinks proper. One such condition may be that the tenant shall not take lodgers. But the action of a few benevolently disposed landlords cannot effect any very extensive reformation, and the paternal character which such landlords are supposed to assume is in itself more and more of an anachronism.

M. BRESSANT.

AN account of the career of M. Bressant, who has only lately retired definitively from the position of Sociétaire of the Comédie Française, has been published by M. Georges d'Heylli; and it is not uninteresting to compare this with the notice of the same actor contained in M. Francisque Sarcey's *Comédiens et Comédiennes*. M. d'Heylli may be congratulated on having avoided the extremely bad taste under the influence of which M. Sarcey, in spite of his boastful assurances that he would have nothing to say about the private life of the players he criticized, has repeated gossiping stories about M. Bressant's family with which the public ought to have no concern whatever. It is unfortunately one of the tendencies of the present time in England as well as in France to pry into the private lives of well-known people; but it is a tendency which one might expect a writer of reputation to resist. M. Sarcey has obtained a reputation perhaps greater than he deserves as a critic; and he might be content to rely upon his powers of criticism without pandering to the vulgar curiosity of Parisian *gommeux*. Whatever a man's qualities may be, he cannot escape the influence of the age, was said by M. Clément, in excuse of Colbert's cruelties; and it may be considered an excuse for M. Sarcey that there are plenty of people more interested by mysterious hints about an actor's family history than by honest criticism of his art. Most sensible people will, however, be inclined to think that M. Sarcey degrades his profession and reputation by the persistence with which he mixes up his judgments of actors and actresses with flippant personalities.

M. Bressant began life as a "petit clerc dans une étude d'avoué," and when he decided to abandon this calling for the stage he was too young to enter at the Conservatoire. Like M. Febvre, he learnt his art in a little suburban theatre; but, unlike that clever actor, he never suffered, so far as diction was concerned, from the want of the Conservatoire's training. M. Febvre's great fault is a terrible indistinctness of speech; M. Bressant's delivery of his words was always admirably clear. At the Montmartre Theatre, which was the scene of his first appearance on the stage, M. Bressant, who was then only sixteen or seventeen years old, played successfully such young men's characters as belonged on other stages to Mme. Thénard or Mlle. Déjazet. M. Sarcey notes a current anecdote that, while the actor was engaged at this suburban theatre, he played in an extravaganza got up to display the talents of Mlle. Séveste, the manager's wife, the part of a bear, and gained much applause by the natural way in which he walked about. Such anecdotes, says M. Sarcey, assuming a high tone, are of little importance; something of the same kind is sure to be said of every actor, from the highest to the lowest; they are only valuable as provoking a smile when they are related of some player who has afterwards taken the highest rank. It would be well if M. Sarcey had treated all personal anecdotes of players in the same lofty way. No one's feelings or tastes can be outraged by its being published that M. Bressant once did or did not put on a bearskin and dance about in that disguise on the stage of the Montmartre Theatre. But by some other things which M. Sarcey has hinted, if not said, as to other players, it is likely that a good many people might be hurt. To return, however, to M. Bressant. It seems that his leaving the suburban theatre was quite as much a matter of chance as his going there. M. Dartois, the manager of the Variétés, paid a visit to the Montmartre Theatre in order to see and possibly engage an actor named Prosper Gothi, of whom he had heard favourable reports. "C'est Bressant qui, par son aimable figure, attira son attention, et qu'il engagea, séance tenante, pour quelque chose comme cent francs par mois." The young actor found, however, that little occasion for distinction was given to him in his new engagement, and took advantage of an opportunity offered to him of going to London with a company at the head of which was Mlle. Jenny Colon. This actress was struck by M. Bressant's talent, and used her influence when she returned to Paris to get him an engagement at the Variétés, where he appeared on April 13, 1833, as Oscar, in *Les Amours de Paris*. French critics seem to have been as unable to recognize latent power in the case of M. Bressant as English critics were in that of Mrs. Siddons, for the judgment upon him of a writer of much repute was expressed in these terms:—"Le nouveau venu est jeune et mauvais." Upon this M. Sarcey observes, with a tone of superiority which seems to indicate that he at least is safe from such mistakes, that critics even then were liable to error. However, about a year after the young actor's unsuccessful first appearance, fate, aided by Mlle. Jenny Colon, gave him a chance of appearing in a part undertaken in the first instance by M. Vernet—Pippo in the *Prima Donna*. Here his brilliant bearing and diction were for the first time revealed; and besides this, as M. d'Heylli says, his pleasant voice and cultivated method in singing found an occasion for exhibition. M. Bressant's latest biographer speaks of the charm

which he gave to Almaviva's serenade in the *Barbier de Séville* during his first appearances at the Français; and even a few years ago, when the actor's voice had inevitably lost its first sweetness, his excellent method made it delightful to listen to his delivery of this song. According to his biographers, proposals were made to M. Bressant by the Théâtre Français while he was acting at the Variétés; but he declined them because he was about to marry the daughter of the *chef de claque* at the Variétés. Anyhow, he did stay at that theatre until 1837, when he accepted a splendid engagement at St. Petersburg, where he remained till 1846, when the autocratic power which, then at any rate, belonged to Russian nobles was employed, for some unexplained reason, to send the actor out of the country. While he was in St. Petersburg, M. Bressant played parts of almost every description. Of these parts M. d'Heylli has made a careful list; and among them we do not find that of Chatterton, in Alfred de Vigny's play of that name. We mention this circumstance because one of the best stories in the *Mémoires de Lafontaine*, referred to some little time ago in these columns, depended upon the alleged fact that M. Bressant had appeared as Chatterton in St. Petersburg.

When M. Bressant returned to France with the high reputation he had made in Russia, he naturally found no difficulty in getting an engagement in Paris, and he appeared at the Gymnase in 1846 with complete success. At this theatre he played till 1854. Then he was on the point of accepting another yet more profitable engagement in Russia when "le Ministre d'État, M. Achille Fould, eut le bon esprit de lui proposer d'entrer au Théâtre-Français et d'emblée avec le titre de sociétaire." It will be a long time probably before, in England, a statesman interferes to keep a great actor in his native country; and even in Paris this unusual mode of interference excited some disturbance. One of its effects was that M. Brindeau, who very justly foresaw that all his favourite parts would be given over to M. Bressant, sent in his resignation, which was accepted. In taking this step he was perhaps somewhat rash. M. Brindeau could never have attained the grand manner which made it possible for M. Bressant, when it pleased him, to merely walk through a part and yet make it impressive. But in certain parts, such as *Carnioli* in *Duila*, and *Clavarocho* in Musset's *Le Chandelier*, M. Bressant's dignity stood in his way, and he could never succeed in making them so natural as did M. Brindeau. Of M. Bressant's best known parts since he belonged to the Comédie Française we have more than once spoken. His admirable rendering of certain characters in what may be called traditional comedy gains a new grace from the knowledge that when he first appeared in Molière's pieces at the Français, having always before been accustomed to modern pieces, he entirely missed the classical air, and only acquired it by close study at a comparatively late age. It is strange to us to find that neither M. Sarcey nor M. d'Heylli speaks in very high terms of M. Bressant's Tartuffe; and we can only suppose that in this particular part French tradition demands something less admirably plausible and natural than was conveyed in M. Bressant's rendering. What is perhaps more strange is that nothing should be said of M. Bressant's performance of Don Carlos in *Hernani*, in which, among other things, he accomplished the difficult feat of holding his audience engrossed during a monologue which lasts a quarter of an hour. M. Sarcey's prediction that no successor can ever be found to M. Bressant is perhaps as trustworthy as the predictions of our ancestors that no one could ever equal Quin; while M. Sarcey's sneers at the effect of the actor's last appearances when he was suffering from illness are nothing less than disgusting, and give a strong handle to the people who are anxious to accuse the French nation of innate brutality, and heartless forgetfulness of the claims of well-tryed servants. Thus much is certain, that M. Bressant was a great actor, and that it must be difficult, if not impossible, to find any one worthy to fill his place. M. Febvre has played the Admiral in the *Chaine* with success, and M. Delaunay's brilliant powers have been seen to advantage in the parts of Richelieu and Gaston de Presles. But M. Delaunay's natural gifts are different in kind from M. Bressant's. He excels in the tenderness which the retired actor missed; and it must be difficult to him to assume the hardness which sat gracefully on M. Bressant. It may well be long before any other actor appears who has precisely the qualities which made up M. Bressant's great talent.

THE CANADIAN MILITIA.

UNTIL within the last few years the military resources of England were generally supposed to be limited to the regular troops, and but little regard was paid to the subsidiary forces. Gradually, however, the belief has gained ground that the standing army comprises but a part of the armed strength of the country, and that the militia and Volunteers must occupy a large place in any question that may arise on the defence of our shores. But to obtain a really comprehensive view of the military power of the Empire a further step is necessary, and the efficiency or non-efficiency of the troops of our principal colonies must be considered, if a true measure is to be taken of what should constitute our resources in the event of war. We pride ourselves on our colonial possessions, and look with satisfaction on their increasing prosperity. We regard with pleasure their powers of self-government, and watch the growth of institutions formed on the model of the parent State; but as yet no statesman has really grasped the ques-

tion of colonial defence, or devised any scheme by which the military resources of our possessions beyond the seas might be utilized for the protection of the Empire, should it be involved in a really serious war. We secure certain ports and naval stations, and then, working on the principle that the colonies must look out for themselves, we leave them free from control to manage or mismanage their military affairs.

The recent Report on the military condition of our greatest colony is, however, far from satisfactory, and calls for the careful consideration of all who believe that England extends beyond the four seas, and that her power is not to be measured by her home resources alone. Since the withdrawal of the regular forces from Canada, the numbers and efficiency of the colonial militia have been gradually diminishing. A long array of officers fills the pages of the Army List, but beyond them there is little to represent military power; and after a while the militia of Canada will be solely represented by the showy uniforms and military titles of gentlemen who have no troops to command. Owing to the difficulty of obtaining money—a difficulty due partly to stagnation in trade, partly to the absence of any belief in the necessity for military organization—the number of men annually exercised has steadily diminished, and the periods of training have been shortened until it has become a question whether it is not a waste of money to do more than provide for enrolment, without making any attempt at drill or discipline. During the last year the force exercised numbered only 23,000 men, in place of 29,000 in the previous year, and the period of drill was reduced to twelve days for field batteries of artillery, and eight days for cavalry, garrison artillery, and infantry; whilst the method of training the men in brigade camps has given place to the less efficient drill at battalion and company headquarters. The stores are also in an unsatisfactory condition; there is not a sufficiency of clothing for even the small force enrolled as the active militia, whilst the quality is far from good. There is a supply of Snider rifles for about forty thousand men, but only 150 rounds of ammunition per arm—a very inadequate quantity when it is remembered that Canada is entirely dependent on England for every round required. The field batteries have been armed with the latest pattern gun, but the fortifications are almost destitute of artillery. As yet the comparatively newly-raised forts destined to defend Quebec are unarmed; and, far from any steps having been taken to protect Montreal, there is not a gun along the line of the St. Lawrence, except a few seven-inch guns in Quebec citadel, that could in any way cope with an invader.

It must be confessed that, as matters stand, the future of the military organization of Canada is not a bright one. When the regular troops departed, it was supposed that about forty thousand men would receive such annual training as would at least bring them up to the standard of our English militia, and that these forty thousand would have at their back 600,000 able-bodied men who could take the field in the event of war. There were several training schools at the headquarters of different regiments, and owing to the then recently terminated war in the United States, and the subsequent Fenian raids, a military spirit had been awakened throughout the country. Now, on the other hand, 23,000 men receive but a very inadequate annual training, and the schools for drill instruction are reduced to the two permanently enrolled and well-organized batteries at Quebec and Kingston. The inspecting officers point out in their Report the want of instructors when the regiments are called out, which we can well believe when it is remembered that there exists no permanent staff, regimental or other, below a brigade major. In the Report submitted to the Canadian Parliament, Major-General Selby Smyth states the case with great plainness, putting clearly before the Government the condition of affairs, and pointing out that, if the annual vote is to be kept as low as it was during the past year, a complete change in the organization of the militia would be necessary. A sum of 650,000 dollars, or about 130,000*l.*, is voted annually for the militia. Of this amount 26,000 dollars is set apart for the newly-established Military College, leaving only 624,000 dollars for the maintenance of the active militia, for arms, clothing, and other warlike *material*, and for keeping up the small permanently embodied force included in the Schools of Gunnery at Quebec and Kingston.

The Military College formed two years ago, somewhat on the model of West Point, with the object of training a staff of officers for the militia, appears to have commenced successfully. There are eighteen cadets undergoing a course of instruction under the supervision of able officers, whose services are lent, but not paid, by the Home Government. Admirable, however, as the purposes of this institution are, its continued vitality must depend on the possibility of ensuring some sort of military career to the young men who are trained there. There is little use in a Staff College if there are no forces for its officers to organize, and it will be difficult to keep up its military character unless some military appointments are open to a large proportion of its scholars. General Smyth's proposal that a limited number of commissions in the regular army should be offered to successful candidates might indeed add to the popularity of the College, but would scarcely correspond with the object for which it was originally formed. The truth is that the time has come for Canada to consider what sort of force she is ready and willing to maintain, and, having determined upon some general principle, to carry it out systematically, and with all the assistance that England can afford. Owing to the peaceful aspect of affairs in the United States, and to the reduction of its army and militia,

the Canadian Government may possibly consider that the force thought necessary a few years ago may be considerably reduced, and that little attempt need be made to provide for the defence of the long frontier that borders on her formidable neighbour. Still, even granting this hypothesis, it is necessary for internal security and for possible contingencies that a great country should possess some military organization and a few troops ready at hand.

For this purpose General Smyth's suggestion that three model infantry schools, to be established near Montreal, Kingston, and Toronto, should be added to the two artillery schools, appears worthy of consideration. At these schools the officers and non-commissioned officers of the militia would receive instruction, whilst a permanently embodied force would be formed of nine officers, twenty-four non-commissioned officers, and two hundred and sixteen privates—certainly a small number, but nevertheless useful as establishing a standard of military efficiency to which the militia should seek to attain. To keep within practicable finance limits the active militia would be reduced to 20,000, and would be confined chiefly to the towns and larger villages, where means of drill are more easily obtained. Thus, whilst the numbers of the militia would be diminished, its efficiency would be augmented; and a careful enrolment of the force on paper would permit its enlargement in the event of war. There is much to commend itself in this scheme, as it provides a system founded on sound principles and capable of expansion; whilst the present plan of endeavouring to keep up the numbers of the force while sacrificing the essential conditions of efficiency leads to waste of money and to a fictitious estimate of resources.

It will perhaps be asked, What has England to do with these internal arrangements of her colonies, beyond the interest that a parent should feel in the well-being of a grown-up child? With regard to the question immediately at issue, it may be enough to point to the necessity of finding a proper garrison for the extensive fortifications constructed at Halifax, the great station of our Atlantic fleet. To man those works thoroughly more than all the militia of Nova Scotia would be required, and the inter-colonial railway which now connects that outlying province with the heart of the Dominion would be used to bring down men and supplies. But surely a broader view of the question than this is worthy of a great country. Canada is almost as near to England at the present time as Ireland was a century ago. Its population is eminently loyal, and is peculiarly fitted to furnish good soldiers, and, in the event of war with any great European Power, would be willing and anxious to send its quota to act with the English army. A good military system in Canada is therefore an object of imperial interest, and with comparatively little expense and trouble the English Government could do much to assist the colonial Executive in its army organization. But, if the object is to be attained, the matter ought not to be regarded as belonging to this or that particular department, nor should the question whether the cost is to be borne by the War Office or the Colonial Office influence the decision. The broad fact should be borne in mind that, in the event of serious trouble, England would have to strain every nerve to meet the requirements that would be made upon her, and the military capabilities of a loyal population numbering nearly four millions should be developed as far as possible in time of peace, in order that they may be utilized if war should break out. The opinion of England is held in high estimation in Canada. Advice offered by her military authorities would be willingly followed, and the criticism that shows appreciation of honest endeavour would be far more readily received than the faint and careless praise which too often conceals contempt. A well-considered scheme for the organization of the Canadian troops, drawn up by the Intelligence Department of our War Office with a due regard to cost, and framed so that it might receive fuller development in time of war, would undoubtedly meet with careful consideration in Canada. Such a scheme should include not only plans for the defence of the colony, but also the means of utilizing its strength for Imperial purposes, or even of finding a place for the voluntary aid which Canada would probably proffer in the event of any considerable expedition beyond our own seas. In fact, the organization of the Canadian army should be almost as closely scanned and as carefully watched as that of our own militia. Distances are gradually disappearing; the ties that unite England with her colonies ought consequently to become closer; and for mutual protection every effort should be made to render them as binding and as efficient as possible.

REVIEWS.

DOYLE'S LECTURES ON POETRY.*

IN closing his second term of office as Professor of Poetry, Sir Francis Doyle fully justifies his appointment by the publication of a selection from his Lectures. He perhaps does himself injustice, or rather he runs the risk of exciting prejudice, by describing the Lectures in his preface as *Epidæiastic Orations*. In a certain sense the title is not inaccurate; but Sir Francis Doyle is

* *Lectures on Poetry*. Delivered at Oxford by Sir Francis Hastings Doyle, Bart., Professor of Poetry in the University. London: Smith, Elder, & Co. 1877.

entirely exempt from the imputation of artificial display. One of his objects, as he candidly says, was to keep his listeners together till he had done speaking; and it may be doubted whether a youthful audience would be most effectually attracted by an Epideictic Oration. "I accordingly thought it better to avoid all attempts at subtle criticism"; and yet some of Sir F. Doyle's criticism is essentially subtle, although it is popular, occasionally brilliant, and always subjective or personal. He was probably well advised in selecting for academic treatment thoroughly well-worn topics. An oral critic can scarcely afford time to narrate to his disciples the dream of which it is his proper business to furnish the interpretation. Wordsworth and Scott and Shakspeare himself best illustrate theories of poetry because they are familiarly known beforehand. It is of course difficult or impossible to avoid coincidences, which may now and then be unconscious plagiarisms, with writers of earlier disquisitions on the same subjects: but Sir F. Doyle's opinions are so evidently spontaneous and natural that he can dispense with elaborate efforts at perpetual originality. When his admiration is most earnest, enthusiasm is happily blended with a vein of humour, which is an indispensable element of the true poetical faculty. Susceptibility to the influence of poetry or of any other art passes into a weakness when it disturbs or suspends self-possession. The power of thinking of two things at once is at the same time the test of perfect sanity and the basis of humour. Like many other commentators, Sir F. Doyle discusses Shakspeare's practice of interposing comic scenes in the midst of the deepest tragedy. The Fool in *King Lear* and the Gravedigger in *Hamlet* represent, among their other functions, the permanent supremacy of common sense or of practical intellect amidst episodes of tragic passion and of imaginative elevation. Sir F. Doyle acutely remarks the employment by the Greek tragedians of "solemn choric song, impassioned music, and majestic dancing" for the same purpose of relieving the nerves of spectators from a monotonous intensity of pressure. The broad comedy of Shakspeare supplies not only an interval but a contrast, which is at the same time nearly related to the pathetic emotion which it replaces. Unsophisticated playgoers who know nothing of æsthetic refinements learn by experience that tears and laughter prepare the way for one another, so that comedy and tragedy are most impressive in close juxtaposition. For a similar reason the beauty of a poem is most keenly felt by minds which are incapable of being absorbed by any external influence. Like *Hamlet's* ideal actor, the true critic preserves a certain temperance in the excitement which corresponds to the histrionic whirlwind of passion. The reserve which is imposed by manly self-respect may be relaxed with comparative ease and impunity where the critic deals with a genial and many-sided writer. Chaucer, Shakspeare, Scott, and, in spite of his gloomy affectations, even Byron, always seem capable of recognizing the humorous aspect of things. The unbroken gravity of Wordsworth and the dreamy sentiment of Shelley require a corrective.

Three of the Lectures are devoted to Wordsworth, and principally to the *Prelude* and *Excursion*; yet it is evident that Sir F. Doyle sympathizes but imperfectly with the poet's intellectual autobiography, or with the same character transferred into the person of the Pedlar.

Wordsworth [he says] "grew immortal in his own despite." He grew immortal because the austere efforts through which he was teaching himself to be a poet vented him at times, and whenever that was the case he deviated into poems (though still from his own point of view little better than a learner and a disciple) scarcely, if at all, to be surpassed. Poems, and perhaps this is one explanation of their supreme excellence, with all the flavour and relish on his palate of stolen waters and bread eaten in secret.

The criticism may perhaps not be the less just because it is not altogether in accordance with Wordsworth's own view of the relation between his longer and shorter poems. In one of his elaborate prefaces he compares the Lyrical Ballads to the chapels and recesses of a Gothic cathedral which has for its central nave the *Prelude* or the *Excursion*. That the accessories were incomparably more beautiful than the principal edifice had not occurred to the contemplative architect; but poets have in all ages failed in their estimates of the comparative value of their own different productions. There is something pathetic in the exhaustion of Wordsworth's genius when, before middle life, he had, as he thought, equipped himself by study and reflection for a great poetical career. Sir F. Doyle is probably justified in attributing the partial barrenness of Wordsworth's maturer years to his self-imposed solitude:—

It is open to us to believe, if we like, that a Wordsworth who had not buried himself among the Cumberland fells, who had not, as it were, called on the hills to cover him, would have been a different Wordsworth—a Wordsworth more illustrious than even now he is.

It is not a little strange that the Professor of Poetry should have devoted so much time and thought to a great writer whom he evidently appreciates only by conscious effort:—

Whilst I confess my own native preference for poetry with more blood and pulsation in it, I yet feel for Wordsworth much of the admiration and reverence which is his due; that is indeed owing to him as a sacred debt by those of my generation. Nor am I prepared to say, if any one condemns this preference of mine as somewhat illiberal and shallow, that he is altogether wrong.

Sir F. Doyle passes with pleasure from a discriminating study of Wordsworth to a hearty expression of sympathy with the Homeric element which redeems the many poetical defects of Scott. The greatest among the English writers of his time would have attained but inferior rank as a poet but for his knightly ballads and the battle-pieces in his longer poems. The mounting of Claver-

house, and the battle of Flodden in *Marmion*, are superior in their kind to any other warlike poetry in the English language:—"The Arab horse in Job went often, I daresay, languidly enough in his slow paces; but the breath of the approaching battle never failed to clothe his neck with thunder; so it is at all times with Scott." Readers of Sir F. Doyle's own poems will not be surprised at his sympathy with martial enthusiasm. His "Private of the Bulls" and his "Red Thread of Honour" derive their inspiration from the same source which Scott found in the history and legends of his native country. The facility and transparency of Scott's ordinary poetical style may be set against his want of concentration and force. The power of imagining and representing living characters, in which among English writers he is second, though after a long interval, to Shakspeare, can scarcely be traced in his poems. His chieftains and warriors have no qualities but the conventional attributes of strength and courage, though Roderick Dhu is somewhat more interesting than Fitz-James, and Marmion than the virtuous Wilton. The more modern figure of Dundee, when he purposes to go wherever he may be guided by the spirit of Montrose, is less conventional, but the Claverhouse of the ballad is most vividly remembered because he is also the stern and graceful hero of *Old Mortality*. Until he began to work in prose Scott had not discovered any part of his true vocation except his gift of relating a battle:—

This was not because Scott imitated Homer, because he was influenced by the reading of Homer, because he hoped to rival Homer; but simply because they both echoed the feelings of, and derived their inspiration from two states of society, widely separated indeed by time, but not otherwise unlike. Mediæval Scotland (the observation is not mine), with its septs and clans, looking up as they did in unquenchable loyalty to their hereditary chieftains (sons of Zeus, as it were, in their eyes, like the primitive sovereigns of Hellas), had much in common with the armed confederation that gathered itself together in front of Troy.

The most thoughtful and instructive of the lectures are devoted to the inexhaustible subject of Shakspeare. The criticism of *Hamlet* has unfortunately been lost; but Sir F. Doyle has accomplished the difficult task of discussing with freshness and novelty *King Lear*, *Othello*, *Macbeth*, and the *Tempest*. His remarks with equal justice and originality that, if the *Tempest* is inferior in power to the great tragedies, it is, if possible, more wonderful and more characteristic of the poet. "If we were called upon to publish those plays of Shakspeare which no one else could have written, in the order of their impossibility, I for one should head with the *Tempest* the title-page of that golden book." None of the human personages of the play are among the most real and significant of Shakspeare's dramatic creations. Miranda herself is distinguished rather by her singular experience, or want of experience, than by her personality; Ferdinand is a mere hero of a romance; and Prospero, as a stately magician, stands apart from ordinary sympathies. Sebastian and Antonio are vulgar villains, and the humour of the comic characters is not of the profounder kind; yet the play appeals with unequalled success to the imagination, and it remains the pleasantest and most real of supernatural fictions. Sir F. Doyle calls attention to the wall of separation which exists between Miranda and the elementary spirits who obey Prospero. "Ariel comes and goes, expostulates and submits, with Miranda apparently quite unconscious of his presence; and, what is stranger, he apparently quite unconscious of hers." A studious analysis of the character of Caliban leads Sir F. Doyle into an ingenious apology for his superficial defects. The poor monster has been deprived of his birthright by Prospero, and he has even been punished for an error which may to him have seemed venial. "Caliban, in point of moral sense, is a child, with the child's indignation against anything which looks like injustice; he has moreover, whatever his bad qualities may be, a spirit of loyal affection which redeems everything. From this, and from the fact that his mind has been shaped by nature, by nature streaming in upon him at every pore, it results that, though brutal, he is never vulgar." The generous rehabilitation of Caliban is more successful than the same process as it has been applied to many historical characters. Shakspeare himself was perhaps not entirely exempt from the injustices which writers of fiction are prone to perpetrate at the expense of their less favourite characters. Scott failed to appreciate the moral and intellectual superiority of Major Dalgely to lay figures like Mesteith, and to melodramatic heroes of the order of Allan M'Aulay. Perhaps Shakspeare was hardly aware of the virtues and capabilities with which he had endowed the unfortunate Caliban. "Let us hope that, if Prospero did not choose to train him up through his power of loving and hating, he was at least set free to enjoy his hereditary kingdom without any dread of being pinched to death by the magician's vassal spirits after the magician himself had left him alone."

Sir F. Doyle's criticisms on *Othello* and *Macbeth* are still more elaborate and more eloquent, nor has so much matter often been contained in an Epideictic Oration. He thinks that "*Macbeth* soars into a higher region of the imagination, and dives lower down into the deep places of the human soul, than any other human composition, except perhaps the Book of Job." Orthodox criticism will still maintain the superiority of *Hamlet*, which, according to the same critic, "is richer in thought, in meditative feeling, in the union of high poetry with high philosophy, than *Othello* or any other drama in existence." It may be added that the destiny of *Hamlet* supplies a deeper and more complex tragedy than the crimes and punishment of *Macbeth*. It is difficult to understand why the simple contrasts which make up the history of Job should be compared with the great masterpiece of

dramatic art. Criticism on criticism is necessarily confined to tame assent, to gratuitous controversy, or at best to the exposition of minute distinctions. It is more to the purpose to recommend Sir F. Doyle's Lectures to students of literature than to show that his comments are generally sound, or to inquire whether they are occasionally questionable.

MACCOLL ON THE EASTERN QUESTION.*

MR. MACCOLL has written a book on the Eastern Question which he has done his best to make exhaustive. He has delivered his soul, and has cursed from the bottom of his heart the Turks and all who love the Turks or defend or even tolerate them. His first great object is to show that the government of Turks over Christians is in its nature unutterably, incurably, hopelessly bad. The horrors of which we have lately heard so much are not, in the eyes of Mr. MacColl, accidental or transitory evils. They are evils which have been incessant so long as the dominion of Turks over Christian races has lasted, and will be incessant so long as this dominion continues. The writer has come to the conclusion that for the Christians in Turkey there is not, and never has been, and never can be, any security for life, or property, or the honour of women, or the freedom of religion. To give the governing Turk any more time to see whether he will not perhaps govern better is, in the judgment of Mr. MacColl, like giving a hardened drunkard more time, with a free run of the public-houses, to see whether he will not leave off drinking. Mr. MacColl has therefore no hesitation in pronouncing that, as a ruler of alien races in Europe, not of course as a private dweller in the land, the Turk ought to be swept away at once. There is no half-heartedness in the book, and Mr. MacColl does not shrink from facing the consequences of his conclusion. He is all for coercion; swift, sharp, unhesitating coercion, to be applied if possible by England and Russia jointly, but, if that is not possible, by Russia only. As he is aware that this part of his work may be received with some distrust and prejudice, he sets himself to prove that Russia is in herself a good and beneficent Power, that as to India she has no designs, and cannot have any, unless she is utterly mad, and that she does not wish, and never has wished, for Constantinople. Lastly, Mr. MacColl reviews the policy towards Turkey which in recent years has found favour with English statesmen, showing that the differences of opinion have been considerable, and that since the beginning of the Crimean war, Lord Aberdeen, the Prince Consort, Mr. Gladstone, Lord Russell, and Lord Salisbury have leaned towards the side of the Christians, and Lord Palmerston and Lord Beaconsfield towards the side of the Turks, while Lord Derby has hesitated, and is hesitating, and will be likely long to hesitate, between the two views.

The main thesis of Mr. MacColl is that Turks must be bad, not so much because they are Turks, as because they are Mahomedans. All Mahomedans, Mr. MacColl says in the plainest and most earnest terms, must be wicked so far as they follow their wicked religion, and unhappily for the most part Mahomedans believe in their religion and carry out its precepts. Mahomet was a cruel, dissolute impostor, and as the followers of all religions try to imitate the character of their founder, the more closely Mahomedans imitate Mahomet the worse they are. When there is a superior Power like that of the English in India to restrain them, Mahomedans are capable of having their innate vices repressed into a state of latency; and when a State consists only of Mahomedans, they cultivate their more odious iniquities quietly among themselves, and do not persecute, outrage, and kill one another in any very flagrant way. But when they have subject Christians to deal with, then the full badness of their black hearts is revealed. That they ever were better in one place than in another is, Mr. MacColl thinks, a mere vulgar error, and in a rapid and trenchant manner he dispels the delusion which has tempted historians to ascribe some virtues to the Spanish Moors. It is totally impossible, he thinks, that Mahomedans should at any time or in any place govern Christians in a decent way. For Christians under a Mahomedan Government there can be no security of property, for the peculiarities of Mahomedan law permit the State to take away the property of individuals whenever it pleases. There can be no security for life, as the Mahomedans alone carry arms, and kill the unarmed Christians whenever the fancy takes them. There can be no security for female honour, as a good Mahomedan is always on the alert to imitate in this respect the example of the founder of his faith; and there can be no toleration of religion, for although Mahomedans may regard with contemptuous patience the quarrels of Christians among each other, this proceeds only from the sporting instinct which prompts men to receive pleasure from the combats of lower animals; and whenever Christianity comes into collision with the dominant faith, it is treated as a faith fit only for dogs. Thus Mr. MacColl overcomes the difficulty which Burke thought so formidable, and frames his indictment against a whole nation, or rather against an eighth part of the human race; and as he is not only a pleader, but a judge, he passes on with rapid steps to his conclusion, and has no hesitation in pronouncing the whole Mahomedan world guilty.

This plan of treating religions in block, and dealing out condemnations by the gross, carries with it its own difficulties, and

perhaps suggests more doubts than it satisfies. The inquiry whether a religion is answerable for all the consequences that have flowed from it—whether, for example, Christianity is responsible for the Inquisition—is a very complicated one. But there is a simpler thought, as to which few readers of Mr. MacColl's book can fail to wonder that it did not strike him. How does it happen that so many Englishmen have lived among the Turks, and have conceived a certain liking for them and admiration of them? Mr. MacColl is continually declaiming against all persons who love or defend Mahomedans or have a word to say in their behalf. And it must be acknowledged that he invents as he goes on various theories to account for their mistakes. When he finds Sir George Campbell praising the tolerance of the Mahomedans, he accounts for this by the supposition that Sir George Campbell, although an excellent Indian administrator, never knew anything at all about the Mahomedans in India. The perversity of Consul Holmes is ascribed to his having lived so long among the Turks that he has become blind to their faults; and people like Sir Henry Elliot are disposed of by saying that they have learnt to think of nothing but supposed British interests, and have thus got into a state of mind in which they see the Turk transfigured and radiant as an angel. Over Dr. Badger Mr. MacColl obtains a personal triumph, which he relishes with extreme zest; for, whereas Dr. Badger has lately been speaking well of the Turks, Mr. MacColl has dug up a former work in which Dr. Badger spoke of them as badly as even Mr. MacColl could wish. All these very different people are therefore utterly mistaken, and Mr. MacColl, who has scarcely any personal acquaintance with Turkey or the Turks, is altogether right, and they are altogether wrong. If Mr. MacColl were to extend his travels round the shores of the Mediterranean, he would find that the error he laments is very widely spread, and that the delusive opinion that, if the Turk has many faults, he has some virtues, may be pernicious and much to be lamented, but is at least entertained by many observers who have every appearance of being impartial.

Mr. MacColl has attentively considered the important question, What is to be done to put an end to the dreadful state of things in European Turkey? He is all for coercing the Turks. It pains him to have to differ from Lord Salisbury; but he does not hesitate. He has to make his choice, and he makes it. He is "willing to face all the calamities" which Lord Salisbury fears. Like Atlas, he is ready to bear the burden of the world. Anarchy paralysing thirty millions of people was what frightened Lord Salisbury; but it does not seem any very great matter to the more buoyant spirit of Mr. MacColl. At any rate, if we will not coerce Turkey, we can look on contentedly and applaud Russia while she does the work alone. But Englishmen foolishly distrust Russia, and in order to remove this distrust Mr. MacColl makes a stirring appeal to his countrymen, and invites them to realize how stupid and bad they themselves are. Englishmen would, he thinks, learn that they are not really competent to form an opinion about anything if they would but reflect how often they and their leading men have been egregiously wrong. For example, most educated Englishmen for a long time concurred in thinking that capital punishment was necessary to repress the most trifling crimes, and Lord Palmerston thought that commercial intercourse would not make France more friendly to us, and that the Suez Canal would not answer. After errors like these Mr. MacColl considers that he may safely put down the English dread of seeing Russia at Constantinople as a bugbear. The Russians, Mr. MacColl is sure, would never wish to go to Constantinople, and if they did go they would never menace India. In fact, Mr. MacColl has got to a point of enlightenment so far ahead of his countrymen that he is able to see that the very best guarantee we could have that Russia would never threaten India would be that she should be in possession of Constantinople. She would have quite enough to do to hold her own there. On any one who might be inclined to doubt whether the conquests of Russia are altogether for the benefit of the conquered Mr. MacColl is down with the peremptory inquiry, Who are we that we should judge others? A startling paragraph is introduced headed "Atrocities committed by England," and Mr. MacColl proves by reference to the events which followed the battle of Culloden, to the Chinese war, and to certain recent proceedings in the island of Tobago, that we can be as cruel, as unprincipled, and as untrustworthy as any people in the world. Criticisms of this stern kind may perhaps be sometimes useful for us to endure, and it may be salutary that we should be summoned to recognize that we sometimes have shown ourselves neither wiser nor better than other people. But for Mr. MacColl's purpose the train of reasoning on which he insists is almost too discouraging, and his readers may be reduced to the state of despondency in which they will ask how, if they are so foolish, they can pretend to decide what is best for Bulgaria, and how, if they are so bad, they can venture to sit in judgment even on Turks.

Whatever may be thought of Mr. MacColl's book as a whole, and of the cogency of many of his arguments on large and difficult subjects, it must be owned that incidentally he carries conviction on some points which have specially interested him. He has, for example, little difficulty in showing that too much has been made of the one act of Russian cruelty related on rather questionable authority in Mr. Schuyler's book, and that in fairness Mr. Schuyler's general testimony to such merits as Russian administration possesses ought to be taken into account. It also seems to us that Mr. MacColl has the best of it in the great impalemt controversy to which he naturally attaches much importance. It may be remembered that some months ago Mr. MacColl asserted that he and Dr. Liddon, when travelling on board a steamer

* *The Eastern Question: its Facts and Fallacies.* By Malcolm MacColl, M.A. London: Longmans & Co. 1877.

saw a man impaled on Turkish territory. To this statement persons in a state of judicial blindness about the Turks replied that such a thing was impossible, as Turks never impaled any one. That Mr. MacColl saw something on a high sharp stick they allowed; but they suggested, first, that it was a bag of beans, and, secondly, that it was an adventurous native who had climbed up on a tall sharp stick to see the steamer go by; so that, in fact, it was not so much Mr. MacColl who was looking at the man on the stick as the man on the stick who was looking at him. Mr. MacColl deals with these suggestions in an effective way, and at least proves that impalement is a more or less common Turkish practice, and asks why, when he says he saw a man impaled at a short distance from his eyes, any one should ignore Turkish habits, and tell him that what he really saw was a bag of beans, or an amateur spectator who chose one of the most uncomfortable of imaginable positions to look at a couple of honest Englishmen? Further, it may be safely said that in one way—and that a way very precious to Mr. MacColl—the book produces an impression from which it is impossible to escape. With great earnestness, with abundance of telling details, and with much force and fervour, Mr. MacColl brings home to his readers the enormous evils of the actual rule of Turkey over its Christian subjects, and the slender chance there is of these evils being remedied. What he says on this head is perhaps not so effective as the short statement to the same purpose made by Lord Salisbury in February. But Mr. MacColl goes over the ground with a passionate eagerness and an amplitude of illustration which cannot fail to confirm Englishmen in their decision to do nothing to uphold the present government of Turkey. This is a kind of success which imparts a real merit to Mr. MacColl's book. There is much wild and crude writing in his pages, and in many parts of his work he will startle or amuse his readers much more than he will convince them. But his book will not have been written altogether in vain; and he will have the satisfaction of knowing that he has done his part to quicken the national conscience and awaken the sense of duty in his countrymen.

LONG'S EPICTETUS.*

MR. LONG has done a great service to English readers by adding to his admirable translation of the Commentaries of M. Aurelius Antoninus a new version of the *Discourses of Epictetus*. The old translation by Mrs. Carter was helpful enough, and we are not sure that her style has not sometimes a freedom which is absent in that of Mr. Long. But, apart from the greater accuracy of Mr. Long, and the satisfaction which every one has in reading a really close and truthful copy of a classic, the new translation does not provoke us with Mrs. Carter's meddlesome notes. The lady was too much influenced by the advice which her friend Mrs. Chapone imparted to her in a pleasing ode:—

Nor thou, Eliza, who, from early Youth,
By Genius led, by Virtue trained,
Hast sought the fountain of eternal Truth
And each fair spring of Knowledge drained;
Nor thou, with fond Chimeras fan,
With Stoic pride, and fancied Scorn
Of human feelings, human Pain,
My feeble Soul sustain,
Far nobler precepts should thy Page adorn.

Thus addressed, Eliza demolished in foot-notes the "fond Chimeras" of the author she was translating, and taunted him with his inferiority to the inspired writers. The unfortunate result was a constant and most unphilosophical sense of irritation in the readers of Eliza's masterpiece. Mr. Long tells us that he began with the intention of revising Mrs. Carter's work, but could not satisfy himself, and so made a fresh version. The following passage, as set against Mr. Matthew Arnold's rendering of the same paragraph from the *Encheiridion*, will show the reader the qualities of Mr. Long's translation:—

Everything has two handles, the one by which it may be borne, the other by which it may not. If your brother acts unjustly, do not lay hold of the act by that handle wherein he acts unjustly, for this is the handle which cannot be borne; but lay hold of the other, that he is your brother, that he was nurtured with you, and you will lay hold of the thing by that handle by which it can be borne.

Mr. Arnold has:—

Every matter has two handles, one of which will bear taking hold of, the other not. If thy brother sin against thee, lay not hold of the matter by this, that he sinned against thee; for by this handle the matter will not bear taking hold of. But rather lay hold of it by this, that he is thy brother, thy born mate, and thou wilt take hold of it by what will bear handling.

It is not hard to see which version reads the more easily, which impresses the mind more readily. Mr. Long's rendering of *αὐτῇ γὰρ ἡ λαβὴ ἐστὶν αὐτοῦ οὐ φερόντῃ* is closer to the rather clumsy Greek than is Mr. Arnold's paraphrase, which keeps the meaning while it improves the expression of Epictetus, or of the person who wrote down his words. To leave this part of the subject, it is enough to say that, while Mr. Long's translation is close and sound, and while he refrains from insisting on his own view of the most doubtful passages, he certainly does not lend Epictetus the persuasive beauty of style which the Stoic lacked. His version,

however, is always English, and may always be read with ease by the English student. And now we may come to Epictetus and his doctrine.

There is something striking in the fact that the two chief moral philosophers and students of life were, one an emperor, the other a slave, in an age when no man was really free except the emperor. The slave of Epaphroditus, the lame Stoic who was driven from Rome by Domitian, and who taught Arrian in Nicopolis, had nothing more at heart than the recovery of human freedom. His lectures, as they have reached us, reveal a condition of the world in which the two great questions for the philosopher were how to endure and how to be free. Men came to the teacher saying, in effect, "Wherewithal shall we be liberated?" The answer of Epictetus, which takes a hundred forms, resolves itself at last into this—"The Republic is within you." The shadow of tyranny covered the world; life, honour, and breath were at the mercy of a master maddened by the exercise of unlimited power. Every one had to ask himself, How should I meet death? in what temper accept exile? how bear the loss of all my property? at what price sell my sense of honour? The answer of Epictetus was that all these things, to the philosopher, are indifferent. No one should even speculate about saving life and property and bodily freedom; "for he who has once brought himself to deliberate about such matters, and to calculate the value of external things, comes very near to those who have forgotten their own character." Again, he says:—

What then should a man have in readiness in such circumstances? What else than this? What is mine, and what is not mine; and what is permitted to me, and what is not permitted to me. I must die. Must I then die lamenting? I must be put in chains. Must I then also lament? I must go into exile? Does any man then hinder me from going with smiles and cheerfulness and contentment? Tell me the secret which you possess. I will not, for this is in my power. But I will put you in chains. Man, what are you talking about? Me in chains? You may fetter my leg, but my will not even Zeus himself can overpower. I will throw you into prison. My poor body, you mean. I will cut your head off. When then have I told you that my head alone cannot be cut off? These are the things which philosophers should meditate on, which they should write daily, in which they should exercise themselves.

This obstinate independence he carried into the smallest matters. Thus it was part of his theory that nature was the rule of life; beads are natural, therefore philosophers should wear them. "We ought to preserve the signs which God has given." If the tyrant says "Come then, Epictetus, shave yourself, I answer, if I am a philosopher, I will not shave myself. But I will take off your head. If that will do you any good, take it off." Suppose it is a question of exile, suppose the Athenian longs to return to Athens, and "cries like a girl, grieving for a little gymnasium, and little porticoes, and young men, and places of amusement." The philosopher rebukes him with words like those of Dante, translated by Mr. Rossetti:—

Still through the body's prison bars
His soul possessed the sun and stars.

"Have you anything greater or better to see than the sun, the moon, the stars, the whole earth, the sea? But if indeed you comprehend Him who administers the Whole, and carry Him about in yourself, do you still desire small stones (the marbles, now 'Elgin') and a beautiful rock (the Acropolis)?"

This wise indifference is often expressed in the words of Cleanthes:—"Lead me, O Zeus, and thou, Destiny"; or in those attributed to Socrates:—"Dear Crito, if it is the will of the gods that it be so, let it be so." When the disciple comes to ask for the reason why, for the metaphysical or theological doctrine which is to be his "strong rock" in the waves of the world, he hardly gets a satisfactory answer. The theology of Epictetus is not more distinct than that of other members of his school. It is enough for him that the world shows tokens of a designing intelligence. Like Cleanthes, he says, *ἐκ σοῦ γὰρ γένος ἐσμέν*; but he is not at all careful to define the nature or the mode of action of his Father in heaven. He does not sigh for immortality, nor even express, with an obvious desire of immortality like that of Marcus Aurelius, his readiness to acquiesce on this supreme matter in the verdict of that which governs the Whole. He is always ready to go whither he is called. He does not occupy himself with speculation as to what follows this childish sport of life. If we have had enough of it, if the game goes wrong we can say, like children, "We will play no more." "The door is open"; but on what does the door open? "To nothing terrible, but to the place from which you came, to your friends and kinsmen, to the elements." Here he becomes dogmatic. "What there was in you of fire goes to fire; of earth to earth, of air (spirit) to air, of water to water; no Hades, nor Acheron, nor Cocytus, nor Pyriphlegethon; but all is full of Gods and Daemons."

Here two questions suggest themselves to the disciple. First, does Epictetus mean, while constantly averring that the "empirical self," the self which can be bound, exiled, tortured, put to death, is no real self, that any conscious being survives the death of the body? Secondly, does he counsel suicide as the door that opens on freedom? It is not within the province of the philosophy of Epictetus to give a distinct "yes" or "no" to either of these questions. As to the former Epictetus holds—and it makes the motive power in his philosophy—that "we have a kinship to God, and that we are fettered by these bonds, the body"; or, again, that we are "carrying about a god within us." But when the elements of these bonds are scattered to the sources from which they came, Epictetus does not assert that the "self" which is akin to Deity, and which in this life is in bondage, goes back to the heaven which is its

* *The Discourses of Epictetus, with the Encheiridion and Fragments.* Translated, with Notes, a Life of Epictetus, and a View of his Philosophy. By George Long. London: Bell & Sons. 1877.

home conscious of its freedom. No idea of future "rewards" of any sort is present to his mind, and just as he is constantly saying that he will cheerfully go to (Tyra, if go he must, so he awaits, with little curiosity and with no enthusiasm, the change which death may bring. On the subject of suicide he is hardly more definite. He sometimes bids his hearers say "We will play no more," if the game ceases to be worth the candle; but it is not given to every one to know when that moment has arrived. His disciples should come to him and say:—

"Epictetus, we can no longer endure being bound to this poor body, and feeding it and giving it drink, and rest, and cleaning it, and for the sake of the body complying with the wishes of these and of those. Are not these things indifferent and nothing to us; and is not death no evil? And are we not in a manner kinmen of God, and did we not come from Him? Allow us to depart to the place from which we came; allow us to be released at last from these bonds by which we are bound and weighed down. Here there are robbers and thieves and courts of justice, and those who are named tyrants, and think that they have some power over us by means of the body and its possessions. Permit us to show them that they have no power over any man." And I on my part would say, "Friends, wait for God: when He shall give the signal and release you from this service, then go to Him; but for the present endure to dwell in this place where He has put you: short indeed is this time of your dwelling here, and easy to bear for those who are so disposed: for what tyrant or what thief, or what courts of justice, are formidable to those who have thus considered as things of no value the body and the possessions of the body? Wait then, do not depart without a reason."

The sum of the philosophy of Epictetus is resignation to bear the will of the ruler of the Whole. This is the wondrous thing, "the great commandment," to understand the will of nature. That will is to be discovered by a close and rational study of "appearances." To him who can withstand the first shock of mere *schein* or semblance of things, the reality will reveal itself, and he will be as fearless and free in his philosophy as the Galileans in their religious enthusiasm. The Galileans are to Epictetus what the Celts were to Aristotle—a people not afraid of earthquakes or of what man could do to them. It is curious to mark the frequent coincidences between his words and those of St. Paul and other writers of the New Testament, and to reflect that he thought of a Christian devotee much as we do of a fakir or a dancing dervish. The great defect of his system, apart from its want of emotion, and of the moral power which emotion gives, is its narrowness. He says "Sorrow not," and gives a hundred reasons against allowing passion any sway. But this brief and empty life would be still more vacant of interest if the passions of men were eradicated, and if poetry, with all its material, were expelled from the world as from the Republic of Plato.

Apart from the value of Epictetus's theory of life and duty, his remains are full of historical sketches of manners. It is amusing to learn that a visit to Olympia was as uncomfortable under Domitian as it is to-day, and that to see the great image of Zeus involved as much trouble as the traveller finds on his way to the German excavations. "Are you not without comfortable means of bathing? Are you not scorched? Are you not wet when it rains?" Here is a domestic sketch:—"But when you have asked for warm water and the slave has not heard, or, if he did hear, has only brought tepid water, or he is not even to be found in the house, then not to be vexed, or burst with passion, is not this acceptable to the Gods?" As to slavery, Epictetus bids masters remember that their servants are "children of Zeus." If the owner replies that he can do what he likes with his own, he is told that it is towards the earth he is looking, "towards the pit, towards these wretched rules of dead men, but towards the Gods he is not looking." With some humour Epictetus reminds a would-be philosopher that, "as soon as you smell Rome you will forget all that you have said, and if admission be allowed even to the Imperial palace, he will gladly thrust himself in, and thank God." Then, as now, there were snobs who would value a man or picture because the prince had spoken well of them:—

Epaphroditus had a shoemaker whom he sold because he was good for nothing. This fellow by some good luck was bought by one of Cæsar's men, and became Cæsar's shoemaker. You should have seen what respect Epaphroditus paid to him: "How does the good Felician do, I pray?" Then if any of us asked, "What is master (Epaphroditus) doing?" the answer was, "He is consulting about something with Felician." Had he not sold the man as good for nothing? Who then made him wise all at once? This is an instance of valuing something else than the things which depend on the will.

There is a taunt aimed at the lady Platonists of Rome who read the *Republic*, Epictetus says, "because it advises women to be common, for they attend only to the words of Plato, not to his meaning." Cynics are warned that moral lessons are none the better for being preached "from a dunghill." Here is a hit at some Professor Blackie of the period, some admirer of "unkempt" students:—

I indeed would rather that a young man who is making his first movements towards philosophy should come to me with his hair carefully trimmed than with it dirty and rough, for there is seen in him a certain notion (appearance) of beauty and a desire of (attempt at) that which is becoming; and where he supposes it to be, there also he strives that it shall be.

The Discourses of Epictetus have not the unrivalled charm of Marcus Aurelius's converse with his own soul. They are more professional, less spontaneous; the incomparably beautiful personality is absent. Yet Arrian says that "the hearer could not but be affected in the way that Epictetus wished him to be"; so we may assume some power in the man which is scarcely distinguishable in his reported lectures.

JOHN LEXLEY'S TROUBLES.*

HAD we not the author's word for it that this story is written by a man, we should certainly have set it down for the first work of some young lady. We should be curious, however, to know to what University the writer owes his degree. He can scarcely belong to either Oxford or Cambridge; for, ignorant though many Oxford and Cambridge men are, none, we should think, would be found so ignorant as to write such a sentence as the following:—"As fellow of his college, he had at various times filled the several offices of junior dean, bursar, vice-president, and lecturer in divinity, and he had successively been elected junior and senior proctor. As a proctor he had been a failure, but such a failure that he had been elected a second time." Mr. Bardsley is quite correct when he goes on to add that the year of office of this fellow of his college "was truly remarkable. Not a single rustication, and the penalty funds deplorably low. Nevertheless, sundry youths were not ashamed to show to their better friends short missives that had reached their rooms after some gownless expedition on the previous night, wherein lay appeals to certain home associations we need not particularize, but which had made the young delinquent rub his eyes and wonder what had made him so soft this morning." Now this is just the kind of description that would have been given, and just the kind of blunder that would have been made, by some young lady who knows as much of a University as can be picked up at a commemoration, or learnt from other female novelists or from the talk of a young curate at a croquet party. But then Mr. Bardsley is not a young lady, but a man and a Master of Arts. We come at every turn on similar puzzles. The heroine is a governess, and, with the exception of Becky Sharp, who hardly counts, we do not call to mind any author of the male sex who makes a governess his heroine. Among the ladies, ever since the days of *Jane Eyre*, the heroic governess has been found in shoals like the herrings that swarm on our Eastern coast. But all this again is beside the mark; for Mr. Bardsley is not a young lady. That an author often writes nonsense is no proof of his sex one way or the other; but then there is male nonsense and female nonsense, the fine but foolish writing which comes from men, and the fine but foolish writing which comes from women. When Mr. Bardsley writes of "a contemporaneously defunct dog," or of "an intermittent chuckle that emanated from a groom," when he makes one of his characters say "my abnormality was accompanied with a secretive tendency," when he talks of two men in a postchaise "evolving themselves out of the gloom and obscurity of the early morning"—even when he calls a floor in a London house an *eloge*—there is nothing specially suggestive of feminine authorship. The writer, indeed, writes foolishly, but not with the sort of foolishness that belongs more to a man than to a woman. But when he tells us how "the splintered scintillations of hot light frisked about the forge," when he calls a road-side inn "a hostelry," when he says that "as people mark clothes, one article after another singly, and with indelible ink, so had they taken each word, look, and gesture, and flattened it out, and set thereon the impress of 'forward,' and then ironed it, so that they might know it again," then we can scarcely refrain from exclaiming, "Surely here we have a writer, young, indeed, and inexperienced, but yet one who with time and practice may hope to rival those great glories of her sex, Mrs. Henry Wood and Miss Braddon."

Miss Braddon must indeed look to her laurels. Even she in her best mood, when dealing with the noble heir to some ancestral domain, and with all her powers stretched to the height of her great argument, could scarcely improve upon such a sentence as the following; and yet Mr. Bardsley has no one higher in his story than a country squire to inspire him:—"That window was his. A sense of proprietorship was upon him. Legal entail, like a wild, famished animal, had fastened upon him from behind, and would not be shaken off. The fangs were in his flesh; its hot breath was inflaming his blood. How he loathed that window that was his! And all the house was his! Never!" Miss Braddon may indeed fairly reply that the inventor need never fear the imitator, the master the pupil, nor a woman a man, and that Mr. Bardsley is a man and a Master of Arts. But let her think of the two windows in the church of St. Owen, and how the great painter was so stirred up to jealousy that he stabbed his apprentice. Every one nowadays, if we may trust her school of novelists, stabs or poisons as readily as our grandmothers pickled walnuts or made cowslip wine; and here is another fine passage of the pupil's which might excuse almost any act of vindictive jealousy in the master:—

Now, in his manhood, at times he would awake in the mid-night, and could scarce forbear startling the silence of the night with an awful cry in fear that he was alone, and he had felt out with his hand in the dark, and till it had touched and grasped some living thing—his brother—his brain had curdled, and he had wished to swoon, that consciousness might go. Who can describe that wild fear? What's it? Is it the Invisible that is upon us, or the Inscrutable, or the Infinite? When Geoffrey had asked him, Johnnie had shaken his head. It was not these things, and yet the influence of each was there. He could only say that a sudden terror of *self* had seized him. Did he fear ghosts and apparitions? Again Johnnie would shake his head. He could only say the spirit he feared was his own consciousness; the goblin he dreaded was himself, an entity. The darkness was an accessory—that, and nothing more. He could remember—his memory had often dwelt in fascination upon it—how he had wandered on to the moorland reach above Windle Height—it was broad noon—when all on a sudden the thought came that he was alone, and a great horror had

* *John Lexley's Troubles*. By Charles W. Bardsley, M.A. 3 vols. London: Chatto & Windus. 1877.

inspired him with wings, and he had fled down, leaping chasms, and clearing walls, till he saw a little child tending some geese on a roadside common; and, gasping for breath, he had sat him down and slowly talked himself into tranquillity again.

One cannot but admire the great art displayed in this passage; how the reader, after being carried up with the hero to the Invisible, the Inscrutable, and the Infinite in capitals, is safely landed on a roadside common amid a flock of geese in small letters.

We have also descriptions of scenery and of weather which, considering that they are not written by a woman, are an excellent imitation of many a woman's style. Time was when the scenery and the weather could be left to take care of themselves; but since the days when the mediæval revival began, and the newspapers took to giving the fullest reports of the atmospheric changes, our novelists—above all, our female novelists—never put down anything that has happened without telling us about the sun glinting, or the air rippling, or the wind wailing. Mr. Bardsley, for instance, in opening his story writes how “a mere ripple of cool air, as it curled the leaves, appeared but to be fanning the golden flame. The hillside, too, behind, had a deep purple hue.” We do not in the least understand what he means; but it sounds very pretty, and, for all we know, may have some conventional meaning. Later on he rises into even greater heights of modern feminine poetry, and modern feminine unintelligibility:—“The hedgerows were thick with wildflowers, red, white, and purple-blue, and all steeped in morning dew, as though they had come fresh from a dip-bath in the purling stream below, before they set themselves to their daily duty of looking purity in the face of man.” The hedgerows, by the way, in the third volume adapt themselves in a remarkable manner to the requirements of the story. The hero's brother was running away from home and going up to London on the stage-coach. Now, as his running away was in the end to lead both to his own marriage and his brother's, it was to be expected that the coach should “pass through scented hedgerows and sylvan shades.” But at his home sad days of course were to be looked for, not only because he had suddenly disappeared, but also because his father was lying on his death-bed. Now sadness and death-beds, unless a young and sainted girl is dying when it is the early spring, always suit best, as every one knows, with the time when “autumn is dying, and with every fitful gust falls leaf upon leaf—some brown and some yellow, some golden, but all to cover him in his grave.” A few days before we had had scented hedgerows. But what of that? Old men can no more die near scented hedgerows than on a partridge feather; and, just as countryfolk often pull a dying man off his feather-bed that he may die easily, so a writer is justified in sending to the right-about the scented hedgerows, and bringing in the time when “a chill and mournful dreaminess in earth and sky was telling forth to all the world the death of the annual life.” Indulgence, however, in such liberties with the seasons is rather a feminine privilege, and Mr. Bardsley, as a man and a Master of Arts, should pay more attention to his almanac.

Still we see no reason why our author should not write a book quite equal to hundreds of others which are read by thousands of people with a good deal of interest. In fact, we are not at all sure that he will not, as it is, have a fair number of readers. Had he only cut down his three volumes to one, he would have made a story which, by those who are fond of stories of this kind, might have been read without skipping a page. As it is, *John Leslie's Troubles* are a vast trouble to the reviewer, and, we should think, to the general reader. We would undertake, if it were worth the while, to cut out three-fourths of the tale, and yet to leave it not only as easy to understand as before, but even far easier. Amidst the tedious descriptions and the dull talk in which the book abounds, the thread of the story is lost, and the reader can scarcely remember what the mysteries are that have to be solved. Why cannot a pair of lovers go to a picnic without our having a full description of the contents of the hamper? Why must the horses be described that drew their wagonette, and the driver who drove the horses that drew their wagonette? Why must more than fifty lines be given to the way in which this ancient driver ate his share of the meal? “Almost all picnics are the same,” says Mr. Bardsley. “Whether wet or dry, they are enjoyable; like their fellows, too, they invariably come to an end.” Almost all descriptions of the food eaten at picnics, we might in like manner say, are the same. Unfortunately, they are very far from being enjoyable, though, like sermons, they invariably come to an end. Mr. Bardsley is apparently one of those young writers who think that a thing, however uninteresting it may be in itself, becomes interesting by being described. They are provided with descriptions, as Mr. Vincent Crummies was provided with a pump and a pair of tubs, and they feel that all that is needed is a story to bring them in. It is a great pity that in what we take to be his first attempt he should have had no one at his elbow to cut out his fine passages and his minute descriptions. He has succeeded fairly well in two or three of his characters—in his hero, perhaps, best of all—and he shows at times a certain amount of humour. His plot is quite up to the common level, though perhaps that is not saying very much. There is moreover nothing offensive from one end of the book to the other. We do not expect that the author will ever rank high among novelists; but there is no reason why he should not write a really readable story, if he were once to lose the power of writing finely, and were to remember that one volume is generally a great deal better than three.

LIFE OF SIR WILLIAM FAIRBAIRN.*

SIR WILLIAM FAIRBAIRN was a conspicuous example of the typical Englishman, or rather Scotchman, who begins life with the traditional three-halfpence, and ends it in prosperity and distinction, the fruit of combined ability and perseverance. Of him it may be truly said that he owed little to fortune and less to mankind, unless it may be that the hardships which he underwent in childhood served to develop his natural pluck and perseverance. Fairbairn's early career is fortunately quite free from obscurity, a full and very interesting account of himself having been given in an autobiographical memoir extending up to his fiftieth year. Born at Kelso in 1789, his early days were passed in poverty and privation, young Fairbairn, with the rest of the family, accompanying his father, a farmer's bailiff, in his wanderings from one part of the country to another in search of work. Owing to these changes of residence the lad's schooling was of an intermittent sort; but the Scotch parish schools in his case maintained their character, and at the age of fourteen young Fairbairn had obtained a far better knowledge of English literature than would have been possible for a boy brought up in England under similar circumstances. His talent for practical mechanics began to manifest itself at an early age, when, in order to relieve himself of the trouble of carrying on his back the infant brother entrusted to his care, he constructed a little wagon in which to draw him about, with no other tools than a knife, a gimblet, and an old saw:—

The success which attended this construction led to others of greater importance, which I continued to practise, and which my father encouraged during the whole time we were in the Highlands. In the formation of boats and ships I became an expert artificer, and was at once a “Jack-of-all-trades,” having to build, rig, and sail my own vessels. From ship-building I proceeded to construct wind and water mills, and attained such proficiency that I had sometimes five or six mills in operation at once. . . . It is not for me to offer an opinion as to the influence these exercises had on my future fortunes; I may leave others to form their own judgment.

In 1803, when Fairbairn was fourteen years old, family difficulties required him to leave school and take a share in supporting his younger brothers and sisters, and he obtained employment for a time at three shillings a week as a labourer on Kennie's bridge at Kelso; but his father, getting the post of steward to a farm belonging to some coal-owners near North Shields, removed there with his family, and William was engaged for a time as a coal-carter, leading a very rough life. “Wages were high and men were scarce; but I doubt much whether periods of extreme prosperity are not on the whole injurious.” This is the opinion of an employer of labour who suffered in his time much inconvenience from strikes, and who therefore was not likely to look at the matter from the workman's side; but Fairbairn's testimony shows that, if there is still room for greater refinement, sobriety, and thrift among the colliers, there has at any rate been a great improvement in their manners and morals since the beginning of the century. “Pitched battles, brawling, drinking, and cock-fighting were the rule of the day, . . . and I believe I counted up no less than seventeen battles which I reluctantly had to fight before I was able to attain a position calculated to ensure respect.” But the first turning-point in his career now came, when in 1804 he was bound apprentice to a Mr. John Robinson, a millwright, on wages beginning with five shillings a week and increasing to twelve, which he sometimes doubled by doing odd jobs out of hours, helping his parents to meet the increasing expenses of the younger members of the family; his evenings Fairbairn persistently gave to study. He was now set in the road for which his genius was naturally suited; but in his case it may be truly said that genius consisted in the art of taking pains. No sudden discoveries marked his career—if indeed discoveries ever are sudden, which may be doubted; throughout his life his talents were chiefly exhibited in the gradual improvements he effected in the existing state of mechanical workmanship, and in the care with which he sought to arrive at the best methods of construction by patient and accurate experiment. Fairbairn expresses this clearly himself when he says in his autobiography (p. 106):—

It would be presumptuous if . . . I attempted to assume a character for originality in my conceptions to which I may not be entitled; on the contrary, I must candidly admit that whatever improvements I have effected in practical science have originated in some useful hint which I have applied, when ruminating on the subject, for the purpose I wished to attain. Having once seized an idea, I have never lost sight of it till the object in view was accomplished, or abandoned if proved on reflection to be unsound in principle.

The time was indeed very favourable for such a career; for, as Dr. Pole well points out in his introductory chapters, mechanical engineering was then in its infancy, presenting an almost boundless field for improvement, and Fairbairn was prominent among those who have brought the art up to its present development. And it might seem at first sight as if such a career would be impossible in the future. Engineering tools and appliances have been brought to such a pitch of excellence that there appears to be no room for one man to get any sensible advantage over his fellows; profits, it would seem, must be governed, not by talent or invention, but by the available command of capital. But this has been the apparent condition of things at all times. We are never sensible of the want of undiscovered appliances. When people travelled by coach it did

* *The Life of Sir William Fairbairn, Bart., partly Written by Himself. Edited and completed by William Pole, F.R.S. Longmans. 1877.*

not occur to them that they travelled slowly; and to the generation before us the rude waterwheels and simple tools which constituted the stock-in-trade of mechanical science no doubt seemed quite satisfactory and sufficient. And just as certainly may we predict that those who come after us will look back with complacent superiority on what they will regard as the crude appliances of the present day, although we ourselves are unable to foresee in what particular direction the future Watts and Fairbairns will extend their discoveries.

Fairbairn's rise in the world was gradual. It shows that, while busily educating himself and acquiring the aptitude of a good mechanic, he had still a spice of the reckless "hand" in his composition, that he should have started off when a young man to see London with only a few weeks' wages in his pocket, with difficulty escaping starvation there before he got a job; and that, noways discouraged by this episode, he should afterwards have made a tour in the south of England and Ireland, arriving in Dublin with three-halpence in his pocket. But his great start was made when, at the age of twenty-eight, having settled at Manchester, and soon after his marriage, Fairbairn determined on the bold step of exchanging the position of a journeyman working for hire for that of an independent millwright. He could hardly, indeed, be called a master; for he and the old shoemaker who joined him in business had at first no other workmen than themselves, and their workshop consisted of an old shed in which they set up their lathe. Their first order was for an iron conservatory; then came the removal of some mill-work, cleverly effected without stopping the machinery; this was followed by the erection of a new mill for another employer, and the firm had now established their name as good workmen, ingenious at introducing improvements into machinery. Their reputation soon extended beyond Manchester, and was much increased by the very satisfactory erection of some large waterwheels near Glasgow, and the execution of similar structures in Switzerland. This profitable business continued for many years, till the French and Swiss were able to construct the improved wheels for themselves.

It was in 1830 that Fairbairn first turned his attention to iron-boat building, the idea originating in the desire to save the canal interest, then threatened by the new railways, by constructing canal steamers which should be capable of traversing canals at high speed. The plan proved impracticable, but it first suggested the employment of iron as a material for shipbuilding; and, although the extensive operations in that line which Fairbairn undertook at London proved commercially unprofitable, and indeed were for many years a heavy burden on the prosperous business at Manchester, still the great development which iron shipbuilding has undergone received its original impetus from him. But he may be said to have first achieved a reputation beyond professional circles through his connexion with the tubular bridges for the London and North-Western Railway over the Conway and Menai Straits. Dr. Pole touches delicately and with good taste on the question which agitated the engineering world at that time, as to the degree in which the merit of inventing the tubular wrought-iron girder should be attributed to Robert Stephenson or Fairbairn respectively; but there is no doubt that the attempt set up at the time to make out Fairbairn to be a mere assistant to the former for carrying his idea into execution was quite unjustified by the facts. Fairbairn was shortly afterwards invited to Germany to submit designs to the King of Prussia for a similar form of bridge over the Rhine at Cologne. In his admiration for this novel and ingenious mode of construction he seems to have had no room for æsthetic doubts of its fitness for adoption in all localities, and it was a great disappointment to him that his design was set aside for one which, if not an ornament to the spot, is at least a degree less hideous than a tubular girder would have been.

From this point Fairbairn's rise in prosperity and general estimation was steady and secure. But increase of fortune and reputation caused no diminution of energy or devotion to the branch of practical science which he had made his own. To the last he continued to pursue those experiments on the strength of iron which have done so much to introduce certainty into the mode of using this material; while the extraordinary abundance of published writings which he found time to produce amid all the pressure of engrossing professional avocations is another illustration of the adage that only busy men have leisure. In harness till the last, and in full possession of his faculties, Sir William Fairbairn, who in 1869 had received the appropriate recognition of a baronetcy, surrounded by his family and with troops of friends, honoured and respected by all, ended a singularly prosperous, happy, and useful career in 1874, at the ripe age of eighty-five.

Dr. Pole may be congratulated on the excellent editing, if he prefers to give it that modest title, of this very interesting memoir. We should have liked the personal details to be fuller, and we could have spared the account of Mr. Hopkins's researches into the structure of the earth, Fairbairn's connexion with which was of the slightest; but in all other respects the book is just what such a book should be. It begins with an admirable summary of the progress of engineering science during Fairbairn's life; and a very just estimate of Fairbairn's own position in the scientific world is given in an interesting letter by Professor Unwin of the Cooper's Hill College, for some years his assistant for scientific research.

OLD WOMAN'S GOSSIP.*

A FEW years ago Miss Kemble (Mrs. Butler), the daughter of Charles Kemble, and well known as an actress and writer of poetical dramas, received from an old friend with whom she had been in close correspondence during a period of forty years a collection of her own letters, amounting to thousands, and containing a history of her life. She thought that these letters would serve as the basis of an autobiography, and that it would be well to publish some abstract of them, instead of leaving it to others to compose the record of her life. These memorials have for a year and more been coming out in the *Atlantic Monthly*, a very interesting and readable American magazine, not as yet sufficiently known in this country, and will apparently be continued for some time longer. Miss Kemble has, as she says, come to the garrulous time of life, and this is indeed shown in the flow of her too voluminous gossip, which concerns not only herself but a great many other people. On the whole, however, there is a good deal of interesting and amusing matter in the narrative, especially in those parts in which she gives an account of her very singular theatrical life. We may pass over briefly her infancy and early years. Her mother was the daughter of a French officer in one of the armies which Republican France sent to invade Switzerland, and Frances was born in London, November 1819. As a child she was very troublesome and unmanageable, her chief offence being a contempt for all authority, combined with indifference to punishment. During her school-days, which were passed both in France and England, she continued to be rather eccentric and difficult to manage. She seems, however, to have been a bright, sharp—rather perhaps too sharp—girl, and to have acquired a good acquaintance with and taste for literature, chiefly poetry and drama. When still young, about sixteen years of age, she began to be aware of the ominous distresses and disturbances connected with the affairs of the Covent Garden Theatre, of which her father was manager. The proprietors were engaged in a law-suit with each other, and finally one of them threw the whole concern into Chancery, where for years it remained, and "seemed to envelop us," says Miss Kemble, "in an atmosphere of palpitating suspense or stagnant uncertainty, and to enter as an inevitable element into every hope, fear, expectation, resolution, event, or action of our lives." In the autumn of 1829 the theatre was advertised to be sold, and there was a probability that the company would be dispersed. The Kembles had, therefore, reason to be anxious as to the future, and Frances felt that, under such circumstances, she was bound to assist her parents. Her own preference was for being a governess, but her family thought the stage would be more profitable. Her mother inquired whether she thought she ever had any talent in that way, and asked her to learn some part as a test of her capacity. Some passages of *Portia* were chosen, but Mrs. Kemble's comment was, "There is hardly passion enough in this part to test any tragic power. Study *Juliet*." Study, she says, then meant with her, and for long afterwards, merely learning by heart; and when she recited bits of *Juliet* before her father and mother, neither of them said more than "Very well, very nice, my dear." One day, however, her father asked her to try her voice at the theatre. In the gloom and silence of the house she was seized with the spirit of the thing, and, having no audience to distract her, her voice resounded through the place. An old friend, who was a good critic, sat in the obscurity of the private boxes, and strongly advised that she should be brought out at once. And three weeks afterwards she made her first appearance on the stage.

The interval was occupied by rehearsals at the theatre and evening consultations at home as to the colours and forms of costume, hair-dressing, &c., "in all which," she says, "I remained absolutely passive in the hands of others, taking no part and not much interest in the matter." Her mother settled the matter, in spite of protests by Mrs. Jameson, by setting aside all suggestions of innovation, such as the adoption of the real picturesque costume of a young Veronese lady of rank, and determining in favour of the traditional stage costume, which was simply a dress of plain white satin, with short sleeves, low body, and a long train. Along with the question of the costume the selection of a *Romeo* had to be settled. Charles Kemble had been Miss O'Neill's *Romeo* throughout her whole theatrical career; but there were obvious objections to his appearing as his daughter's lover, and another *Romeo* had to be found. At first her brother Henry was thought of. He was in the bloom of youth, and very handsome, and a few years later might have been the very ideal of a *Romeo*. But he looked too young for the part, as indeed he was, being three years his sister's junior. He had, moreover, an insuperable objection to the idea of acting, and an incapacity for assuming the faintest appearance of any sentiment. He learned the words, however; and, with his father, mother, and sister for audience, went through the balcony scene with "the most indescribable mixture of shy terror and nervous convulsions of suppressed giggling." After a time his father threw down the books, and Henry gave vent to his feelings by clapping his elbows against his sides, and bursting into a series of triumphant cock-crows. The choice of a *Romeo* which was actually made was, for other reasons, not satisfactory. The part was given to Mr. Abbot, "an old-established favourite of the public," Miss Kemble says, "a very amiable and worthy man, old enough to have been my father, whose performance, not certainly of the highest order, was never-

* *Old Woman's Gossip.* Frances Anne Kemble. *Atlantic Monthly*, Trübner & Co.

theless not below inoffensive mediocrity." He had a good figure, face, and voice, the carriage and appearance of a well-bred person; but, wanting passion and expression in tragedy, he resorted to vehemence to supply their place, and was exaggerated and violent. Moreover, in moments of powerful emotion he was apt to become unsteady on his legs, and Miss Kemble was always afraid lest in some of his headlong runs and rushes about the stage he should lose his balance and fall; as indeed he once did in the *Grecian Daughter*, in which he enacted her husband, Phocion, and, trying to embrace her after a period of painful and eventful separation, completely overbalanced himself, so that they both came to the ground together." The writer adds:—"The only time I acted Juliet to a Romeo who looked the part was once when Miss Ellen Tree sustained it. The acting of Romeo, or any other man's part by a woman (in spite of Mrs. Siddons's Hamlet) is, in my judgment, contrary to every artistic, and perhaps natural, propriety; but I cannot deny that the stature, 'more than common tall,' and the beautiful face, of which the fine features were too marked in their classical regularity to look feeble or even effeminate, of my fair female lover made her physically an appropriate representative of Romeo. She looked beautiful and not unmanly; she was broad-shouldered as well as tall, and her long limbs had the fine proportions of the huntress Diana." It may be remembered that Miss Tree, afterwards Mrs. Charles Kean, performed in such parts as Rosalind, Viola in *Twelfth Night*, Imogen, Ion, &c. As Romeo she fenced very well; and the only hitch in the usual business of the part was that Juliet objected to Romeo plucking her body from the bier and rushing with her to the footlights. "If you attempt," she said, "to lift or carry me down the stage I will kick and scream till you set me down," which ended the controversy.

On the whole, Miss Kemble seems to have been fairly successful in her first appearance; but she naturally felt very nervous beforehand. As she sat dressed waiting for the call, or, as she puts it, "ready for execution," she could not repress her tears, so that the rouge had to be more than once renewed. At last the word came, with a brisk tap at the door, and "started her upright." She was led to the side scene opposite to the one from which she saw her mother as Lady Capulet advance on the stage, and the uproar of the reception filled her with terror. Old Mrs. Davenport (the Nurse), Mr. Keeley (Peter), and half the company engaged in the piece, except her father, who had purposely retreated, unable to bear the scene, stood around her as she lay, all but insensible, in her aunt's arms. "Courage, courage, dear child! poor thing, poor thing!" reiterated Mrs. Davenport. "Never mind 'em, Miss Kemble," urged Keeley, in that irresistibly comical, nervous, lachrymose voice of his, "never mind 'em; don't think of 'em any more than if they were so many rows of cabbages." Nurse was then summoned, and on waddled Mrs. Davenport, and called in her turn "Juliet," who was pushed forwards by her aunt, and ran straight across the stage. She says:—

I got hold of my mother, and stood like a terrified creature at bay, confronting the huge theatre, full of gazing human beings. I do not think a word I uttered during this scene could have been audible; in the next, the hall-room, I began to forget myself; in the following one, the balcony scene, I had done so, and for aught I knew I was Juliet After this I did not return to myself till all was over, and amid a tumultuous storm of applause, congratulations, tears, embraces, and general joyous explosions of unutterable relief at the fortunate termination of my attempt, I went home. And so my life was determined. I devoted myself to an avocation which I never liked or honoured, and about the very nature of which I have never been able to come to any decided opinion.

The last sentence of this passage sums up the writer's views as to her new position, and there can be no doubt that it was unfortunately chosen. She deserves respect for the unselfish sacrifice of her own tastes and wishes which she made for the sake of her father and mother; but she thereby entered on a false position, which was all the more painful because she was aware that it was so. There was, no doubt, at the moment a pressing reason why she should take this step. Her family were in depressed circumstances, and required help, and this could just then be most effectually afforded by her going on the stage, where, it might be assumed, she would be an attractive adjunct to her father, and would add to the popularity of his name. And to a certain extent it would appear that she was successful in this way; but being an actress was evidently a cruel trial for her, as she had no taste for or sympathy with the art, and was also, in fact, deficient in the natural qualities and training required for it. This is admitted by herself, and though it would seem that, under the influence of sympathetic enthusiasm, she did at times produce an effect, yet her doubts about the profession, and her habit of analysing its characteristics and conditions, were fatal to her rising to eminence in the art, or being otherwise than uneasy and unhappy in following it. The Kemble family had in both sexes all been theatrically inclined, and had been more or less successful on the stage. Frances's mother, too, had been an actress, but Frances somehow lacked the necessary qualities, though brought up amidst the people and the associations of the stage. She had a taste for dramatic literature, and some skill in writing plays; but the vivid emotional power which is required in a really effective actor was wanting. The burden of her lamentations over her successive efforts in different parts is always the same:—"I do not think I ever spent a more miserable day than that on which I acted Mrs. Beverley for the first time." "My father tells me that after Easter I have to play Lady Macbeth! It is no use thinking of it, for that only frightens me more." "I have been sobbing my heart out over

Constance all this morning." This is the melancholy refrain:—"My task is sadly distasteful to me; it seems such useless work." In short, she appears to have shared the opinion of another actress, Miss Brunton (afterwards Lady Craven), who used sometimes in a scene to turn to her fellow-actor and say:—"What nonsense all this is; suppose we don't go on with it." Macready, she mentions, told her she did not know the elements of her profession; and she herself admits that she was "totally inexperienced in all the minor technical processes most necessary for the due execution of any dramatic conception." One constant source of difficulty was the overshadowing fame of Mrs. Siddons. Although slighter and smaller in figure and less dignified than her great aunt, Miss Kemble bore a sufficient resemblance to her to suggest a remembrance which was necessarily very much to her own disadvantage. Her sincere friend, Mr. Harness, told her that "seeing her act was exactly like looking at Mrs. Siddons through the diminishing end of an opera-glass"; and there can be no doubt that in such a case it was a great mistake that she should have been put forward in parts which recalled the powerful acting of her famous relative, and brought into notice her own comparative insignificance. And in another way, too, Mrs. Siddons seems to have been like a cloud over her, for she says that a deep impression was made upon her by "the rapid vacuity of my aunt's life," and "her apparent deadness and indifference to everything, which I attributed (unjustly perhaps) less to her advanced age and impaired powers than to what I supposed the withering and drying influence of the over-stimulating atmosphere of emotion, excitement, and admiration in which she had passed her life; and that "such was my dread of the effect of my profession upon me that I added her act was exactly like looking at Mrs. Siddons through the diminishing end of an opera-glass"; and there can be no doubt that in such a case it was a great mistake that she should have been put forward in parts which recalled the powerful acting of her famous relative, and brought into notice her own comparative insignificance. And in another way, too, Mrs. Siddons seems to have been like a cloud over her, for she says that a deep impression was made upon her by "the rapid vacuity of my aunt's life," and "her apparent deadness and indifference to everything, which I attributed (unjustly perhaps) less to her advanced age and impaired powers than to what I supposed the withering and drying influence of the over-stimulating atmosphere of emotion, excitement, and admiration in which she had passed her life; and that "such was my dread of the effect of my profession upon me that I added her act was exactly like looking at Mrs. Siddons through the diminishing end of an opera-glass"; and there can be no doubt that in such a case it was a great mistake that she should have been put forward in parts which recalled the powerful acting of her famous relative, and brought into notice her own comparative insignificance.

Miss Kemble's gossip also includes numerous anecdotes of eminent actors and other persons. We have an amusing glimpse of Liston at the beginning of his career, when he used to recite Collins's "Ode to the Passions," attired in a pea-green coat, buckskins, top-boots and powder, with a scroll in his hand, and also essayed his tragic powers in Hamlet. He seems to have had a taste for fun of rather a mischievous kind, such as trying to excite the risibility of the actresses by presenting some ludicrous object to them just as they had to go on the stage with a serious aspect. Thus he presented an Ophelia with a basket of carrots, onions, and pot-herbs instead of the conventional flowers and straw; and, having painted the face of Mrs. Stephen Kemble's daughter Fanny like a clown, confronted her with her mother just as the latter was making up a grave face to act with in a mournful part. There was also a very nervous actress whom he would frighten on the stage by making gestures as if there were something wrong with her dress, as to the act of which she was very particular. Once he infused a little drollery into the funeral scene in *Romeo and Juliet*, which used to be most elaborately dismal, and often, Miss Kemble says, made people ill, by giving the chorister boys bits of brown paper to wipe their eyes with. We are also shown Sheridan, on the first night of *Pizarro* at Drury Lane, hard at work writing the finish of the play, while Mrs. Siddons and John Kemble had to learn the scraps sent to them as the piece went on; and also the dismal scene on Saturdays, when the unfortunate workpeople and underlings of the theatre used to make pathetic appeals to Sheridan for an instalment of wages, and he would say cheerfully as he passed to the treasury, "Oh yes, certainly, certainly, my good people," and then go off by a back way with the whole receipts in his pocket. There is a pleasant picture of Mrs. Inchbald, who is described as "a person of very remarkable character, lovely, poor, with unusual mental powers, and of irreproachable conduct." Her life was devoted to the care of a dependent relative disabled by sickness. She was "singularly upright and unworldly, and had a childlike directness and simplicity of manners, which, combined with her personal loveliness and halting, broken utterance, gave to her conversation, which was both humorous and witty, a most peculiar and comical charm." She was not an actress of special merit, but still of respectable capacity; and although she stuttered habitually in private talk, she spoke fluently on the stage. There are also sketches of social and political celebrities, such as James Smith of the *Rejected Addresses*, Horace Twiss, Basil Montague, Hook, Weber, Mahbuan, Lord Melbourne, Lady Caroline Lamb, Lawrence the painter, and many others.

ST. HELEN'S, BISHOPSGATE.*

THERE used to be a stock question for debate at Mutual Improvement meetings; it ran somewhat as follows:—Which is worse (or better), a great opportunity without a great man, or a great man without a great opportunity? A question of the same kind might be started as to books. Whether is better a great subject without a great writer, or a great writer without a great subject? There can hardly be a more promising subject than Old London. Writers of all kinds might treat of it. There is history and poetry and philosophy in it. There is physical geography and antiquarian topography and anecdotal biography. There are statistics and art and architecture. Medicine, law, and theology

* *The Annals of St. Helen's, Bishopsgate.* By Rev. J. E. Cox, D.D. London: Tinsley Brothers. 1876.

may be included. In fact, we can wish a competent author, whatever may be his own tastes, no more interesting or worthy topic than one which in any way relates to London. Yet it is simply disheartening, as book after book comes out, and as one by one the various aspects and divisions of the subject are touched, to find so seldom anything but servile imitation of old authority, tradition and legend taken as fact, false inferences from true premises, and conclusions drawn against the weight of evidence. A history of St. Helen's, Bishopsgate, might be learned, amusing, and didactic all at the same time. It might begin with some account of the ground occupied by the nunnery; why does the churchyard slope so steeply from the street? Where did the old wall pass? What Roman remains have been found on the site? Such questions might be discussed as preliminary to the history. Next might come an account of the Priory; who were the founders? when was it founded? what were the names of the prioresses? what mention is there of them in contemporary history? To this might be appended, in a foot-note or otherwise, the original documents relating to the foundation, and perhaps a "terrier" of the lands and houses belonging to the nuns. Chapters on the Suppression, on the eminent men who were connected with the parish, such as Richard Williams, *alias* Cromwell, Shakespeare, Richard III., and Sir Julius Cæsar, on the recent changes, on the boundaries of the parish, on the condition of the church, the monuments, and the records, with extracts—all these might follow in order, and the result would be a book which would satisfy any reader. An appendix might be made to contain the originals of documents noticed in the text, and the registers and churchwardens' accounts in full, if it were desired. A parochial history of this kind is always welcome. It is never dry reading, even to people who care little for antiquarian details. And the history of an important London parish deserves some such treatment. There is so much of association, so much of what may be called the poetry of history, in it, that we can hardly realize the state of a man's mind who sits down deliberately to compile a volume like this before us. It has been long expected at the hands of Dr. Cox, and our disappointment is the greater. The very first words dissipate any hopes we may have formed. After all that has been done of late years to put historical topography on a scientific footing, it is depressing to read as follows at the head of Chapter I.:—"Tradition reports that St. Helena, the patron saint of this Church, was born at Colchester A.D. 242, and was the daughter of Coel II., Prince of Britain and King of that district." After this one feels inclined to close the book in despair; and a further examination shows that Dr. Cox has determined to write the rest of his work according to this beginning. After the story of Helena comes a long quotation from Richard of Westminster to show that she was born in London, and a short one from Stow to show that she built the walls of London and Colchester. Next there is a paragraph which from its importance must be given as it stands:—"The original church of St. Helen in London was dedicated to the Empress Helena, and is said to have been erected to her memory by her son Constantine." A foot-note cites the unimpeachable authority for this remarkable assertion—that of the *European Magazine*.

The early parochial history of London deserves better treatment. There is no saying what important results might not be achieved by its adequate investigation. How did this parish come into existence? Was the church of English foundation? Was there any manor, any sok, any great estate in the parish? Who were Ranulph and Robert, who gave the church to the Canons of St. Paul's? and when was the agreement made which Dr. Cox prints in full both in English and Latin? The names of the witnesses, twenty-one in number, would surely have made it possible to find a date. But, in truth, we must be satisfied for the present with what Dr. Cox is good enough to give us. The history of St. Helen's has yet to be written; but Dr. Cox's collections, so far as they go, may be found of use to the future writer. Dr. Cox is quite unable to make any deductions from the documents he quotes. He belongs to the same order of antiquaries as Mr. Hugo, to whom he constantly refers, and we can only hope, for the sake of the coming historian, that his excerpts and citations are correctly made. At the same time it must not be supposed that they are all of equal value. For example, the chapter on the monuments begins with two pages extracted from Chauncy's *Historical Antiquities of Herts*, on sepulchral usages in general, from which we obtain the interesting information that "monuments are denominated a *moniendo*," that epitaphs were invented by Linus the Theban poet, and that they "serve for four uses or ends"—namely, to prove pedigrees, to show when "the party deceased," to set an example "to follow the good and eschew the evil," and, lastly, to put the living in mind of their mortality. After thus spending two pages, Dr. Cox goes on to say, "It would occupy far too much space to enumerate the numerous monuments which exist within the walls of St. Helen's." This astounding announcement will probably mark the place at which most readers will leave off. Fortunately, however, Dr. Cox consents to mitigate the rule so far as concerns "those most specially worthy of notice," and we have a meagre and unsatisfactory account of the chief feature of what Dean Stanley once happily termed the "Westminster Abbey of the City." The monuments removed from St. Martin's Outwich are only named in an appendix, and then very slightly, although they have so greatly added to the attractions of the church. Of the monuments described, one or two will hardly be considered to have been worth a

description. There is a cut of the tablet of William Bond, *Flos mercatorum*, but the quaint Latin epitaph is omitted, while the long inscription to William Finch, which is by no means so interesting, is printed at full length both in Latin and English. The famous deed in white marble upon black by which Sir Julius Adelmare, otherwise Cæsar, binds himself when called on to pay the debt of nature, is given in an English translation, but the Latin may be made out from a good woodcut:—

Omnibus Xpi fidelibus ad quos hoc presens scriptum pervenerit: scilicet, me Julium Adelmare alias Cæsarem militem utriusq. Juris doctorem Elizabethæ Reginae supremae curiæ Admiralitatis Judicem et unum a magistris libellorum: Jacobo Reginae privatis consiliis, cancellarium Scaccarii et sacrorum secretorum Magistrum hac presens carta mea confirmasse, me adjuvante divino numine Naturæ debitum libenter solutumum quam primum Deo placuerit.

This singular document is dated 27 Feb. 1634, and below is a line "Irrotulatur Cælo," and a second date, that of the Judge's death, 18 April, 1636.

The chapter on the "Worthies" connected with St. Helen's is scarcely better, though the details are a little less meagre. Dr. Cox seems to prefer biographical compilation, and gives some interesting particulars of the lives of Crosby, Holles, Judde, Cæsar, and others, for the most part made up of extracts, but perhaps none the worse on that account. The specimens of Dr. Cox's own style which he offers us are not such as to cause a reader any reluctance in turning aside to the writings of other authors. But the extracts are not always happily chosen. At the end of an account of Richard Williams *alias* Cromwell, we are treated to a paragraph from that very recalcitrant writer Stow, inserted to enable us to judge for ourselves of "the energetic action taken by Thomas Cromwell in the progress of the Reformation." One would think the great Earl of Essex was almost unknown to fame; and that Dr. Cox, by his careful study of Stow, had found out something new about him. After all, the paragraph only records that a Bible was in his time placed in every parish church, and that parochial registers were then begun to be kept. Clearly Dr. Cox has never read Mr. Green's *Short History*, nor heard of the "English Terror."

But it is tiresome, as well as vexatious, to wade any further through this dull book. It has one merit—a good index—and the cuts, if not very numerous, are fairly engraved, and well selected. That St. Helen's should have fallen twice running into such very incompetent hands as those of Mr. Hugo and Dr. Cox is nothing less than a public misfortune. The subject was a worthy one, and perhaps we may yet see it worthily treated. A more charming oasis in the desert of the City than is afforded by Great St. Helen's can scarcely be imagined. Once within the gateway, and the turmoil raging outside may be forgotten. There is green grass, at least a little. There are a few green trees. On the right is the terribly restored back of Crosby Hall. Round the square are "Queen Anne" houses of the utmost quaintness of which red brick is capable. An open doorway admits through a panelled and marble paved hall the hot rays of the sun from a neighbouring court. The western door of the church, designed by Juigo Jones, and surmounted internally with a profusion of carving, reminds the visitor that "This is none other than the howse of God." The side porch is still more curiously Jacobean, and the church is full of monuments and tablets, Gothic and classical, a plain stone tomb in the Nuns' aisle bearing, each Sunday morning, the dose of fresh loaves on a linen cloth which some unknown benefactor left to the poor of the parish in the centuries long gone by. Once within you may fancy yourself in a country church, so entirely does every arrangement differ from that of an ordinary City church. In the first place, there is a congregation. Whatever may be Dr. Cox's shortcomings as an author, there is no doubt that he succeeds, not only in filling his church, but in keeping it full, and giving every member of the congregation something of a personal interest in the maintenance of the ancient fabric. A little too much has perhaps been done in the way of "restoration." Some of the monuments have been needlessly moved about. The stained glass is startlingly modern. But, on the whole, we are not disposed to find fault. The Ionic pillars of Jones's work have not been taken away, nor has the oak carving been replaced with stained deal as in so many other churches. The lover of heraldry will find much to interest him; but we wish Dr. Cox had told us to whom the arms on the "Nuns' Grate" are to be attributed. He tells us (p. 42) that they are "no longer discernible"; but, unless we are greatly mistaken, they were very plainly visible not many years ago, and drawings of them probably exist. But Dr. Cox's heraldry is not what it ought to be, and perhaps he is right to give us as few examples as he can. One deserves notice. We read (at p. 43) of a piece of beautiful carving which had been used to sustain the Lord Mayor's sword and mace when he came to St. Helen's in state; and the arms blazoned on it were as follows (we quote verbatim):—"Ar. a cross, Raguly. Gu. and a dexter canton. Ermine—the arms of Sir John Lawrence, Lord Mayor, 1665." This charming heraldic description reminds us of the shield of the Baron of Barbazure in Thackeray's *Pierre Vanoni*:—"The three mullets on a gules wavy reversed, surmounted by the sinopie couchant Or; the well-known cognizance of the hobbes, blazed in gorgeous heraldry on a hundred banners, surmounting as many towers."

THE HERITAGE OF LANGDALE.*

MRS. ALEXANDER has broken fresh ground in her new book, and has laid the scene in the time when pretty gentlemen wore powdered wigs and laced coats, carried swords and used them on small provocation, swore strange oaths, drank deep and played high, broke the Ten Commandments with as little compunction as they boxed the watch or kissed the chambermaid, and made life difficult for the staid and perilous for every one. Consequently her book deals with false personations, abductions, enforced marriages, and personal tyrannies impossible in our present society, but natural enough in times when the Strand was nearly as dangerous as Hounslow or Bagshot Heath, and these were in a worse condition for travellers than Sicily is at the present moment. A hundred and sixty years ago strange things were done in England; and in the remoter districts where there were few neighbours to watch, and none powerful enough to prevent, the iniquity of those in high places, all manner of foul crimes were committed, with no one to help the poor victims, or to carry the history of their wrongs to those by whom they might be redressed. The incident, then, with which *The Heritage of Langdale* opens was possible in those bygone days, if it smacks of improbability, even with all the appliances of desperate sea-rovers and faithful adherents ready to cut a throat or a purse at the word of command, and afraid of nothing so much as of the monotony of virtue. As it is, however, the peg on which the whole of the story hangs, and as Mrs. Alexander has written a lively, good-tempered, rattling novel, we must shut our eyes to the length of the bow first drawn, and try to believe in the marriage as she has presented it.

This marriage is presented thus. Maud Langley, the rightful heiress of Langdale, is the ward of her half-uncle John. The family estates have been forfeited for the political misdeeds of Maud's father, he having been on the losing Jacobite side; but there is a pardon floating somewhere about the world, of the existence of which John is aware, and which, when found, will place Maud in possession of the whole rich heritage. As it is, she appears to be a penniless dependent on her uncle's bounty, this uncle being "half-brother on the left hand" of her late father, and a scheming, surly, sullen villain, who had never forgiven his brother for having been born after the marriage of their parents, while he had lost the rights of primogeniture by coming into the world before. He therefore thinks to make matters square by marrying his niece to his son; knowing that the pardon will some day be brought to light, and that thus the estates will come at last into the elder, if the illegitimate, branch. Maud, partly cajoled, and partly bullied, at last agrees to the marriage, which is to take place at Langdale Priory; whither the uncle, who has been appointed by the Government agent and administrator of the estates, has brought her—the wild loneliness of the place favouring any deed of violence that he might desire or devise. But while Maud and the parson, the uncle and the waiting-maid, are ready for their various parts at the Priory, the bridegroom elect is the hero of a rather unpleasant adventure. He is at the little village inn down in the valley, whither he had been drawn by a letter purporting to come from some fair intriguante who desired to see him; but when he finds that no *bona roba* is to the fore, he hastens to return home, and then learns that his horse has been broken away and none other is to be had. After sundry imprecations accompanied by various smart blows with his whip, he sets out to walk, when he is surrounded by a gang of men who blindfold him, strip him of his fine blue and silver coat, yet do not otherwise maltreat him, but only keep him in close custody for a certain time. When he is released he hurries off to the Priory to find that Maud has been already married to a strange man personating him, and not detected as an impostor even by his father. Only Maud discovers the cheat after the binding words have been spoken; and she keeps the secret, even though she swoons, fearing lest the stranger, whose eyes "were like her father's," should be assassinated, as in all probability he would have been. As she dislikes her cousin Harold, though she had been weak enough to consent to marry him, she is not sorry for the obstacle that has now been placed between them; and, girl-like, nourishes a faint unspoken feeling of romance for the man who has rescued her from what would have been lifelong misery, and whose manner was more than kind, as his action was even more than chivalrous. In this delineation of the girl's unexpressed and only half-formed feeling the author has shown the same light hand and subtle delicacy that she showed in her character of Maggie in the *Wooing Ot*. She has caught the vague, shadowy, dreamy hope, mingled with fear and doubt and wonder as to what and who this strange husband of hers might prove himself to be, which would be the state of mind into which a girl would be thrown by such an event, yet which few writers would have presented with Mrs. Alexander's accuracy of touch, and skilful steering between mawkish sentimentality and unnatural coldness. She carries the same skill into the description of Maud's feelings when she has discovered who her husband really is, and when what would otherwise have been her natural admiration for him has been checked by the warnings and muttered whisperings of his iniquities with which her aunt for her own purposes has plied her. His eagerness, too, and rather fiery manner of wooing frighten her when she is taken by him to his lodgings, after he has rescued

her from her cousin Harold's first attempt at abduction; but the dawning of a warmer feeling is very prettily indicated, and is quite in keeping with the whole character of the tender-hearted, pure, and maidenly heroine. Mrs. Alexander is happy in her heroines. She has the knack of presenting reasonable women full of womanly feeling, but free from passion, and as devoid of coarseness as of prudery.

Lady Helmsford is not so successful a presentation as Maud Langley. We will give her portrait in the author's own words:—

The Countess of Helmsford sat at her toilette one foggy evening about the beginning of the year.

The Countess was a great lady—a beauty still—a wit—a politician—an institution of London life in the first quarter of the eighteenth century. The dinners and card-parties of Lady Helmsford were heavens of fashion into which the outsiders strove for admission with far more of purpose and untiring application than they did to make their "calling and election sure." The Countess was nobly born, nobly wed, and early widowed. Tory by birth and early association—Whig by choice—through a certain cold cleanliness of intellect, which generally guided her right, save when passion blinded her with the gold dust of delusion.

She was a large voluptuously-formed woman, with a pale olive complexion, and dusky shading of the upper lip quite un-English.

A stately commanding woman, formed by Nature for a great lady. And now she sat before her toilette-table gazing intently on her mirror, while with her own fair discriminating hand she fixed the quaintly-cut patches contained in a box held by an obsequious waiting-woman on the plump and delicately-rouged cheeks, which, one after the other, she turned to the light of the wax-tapers in the girandole.

"There, Beville, I need add no more. In truth, it is sad waste of labour and of time. There is no one in town worth dressing for, only worn-out old rakes and insipid young ones. Ah, Beville, there is not one, Whig or Tory, to compare with that splendid Spaniard who dazzled us all in Paris last autumn."

Lady Helmsford spoke to her maid with the sort of contemptuous confidence tyrants bestow on slaves they imagine too lowly to judge or to disapprove.

The Spaniard of whom she speaks is a certain Don Juan di (*sic*) Monteiro, the secret of whose real personality we will not tell, and who has been her lover after a fashion. But what was a passing fancy with him was a true passion with her; and, according to the manner of men and women, as his love waned hers grew, till at last she lost all self-respect and reticence in the headlong madness of her despair, and flung at his feet the love which he had not cared to take to his heart. But from Sappho's days downwards what woman ever won a man's heart by openly offering her own? And the Countess of Helmsford is no exception to the rule. He is madly in love with Maud, of whom the reader discovers at once that he is the mysterious husband, and is only solicitous how he can win her love in return without showing his cards prematurely. For the whole story is bound up with the royal pardon, and consequent restoration of the estates, which pardon is to be found somewhere, though no one knows exactly where; and, when found, will release Maud from the guardianship of her half-uncle, and make her marriage with her cousin Harold less and less possible. If, then, Monteiro can win her love, voluntarily and frankly given, his happiness is secure on all sides; but he must not let the Countess know how things stand between him and her niece—now her guest and charge—Maud having run away from John Langley to throw herself on the protection of Lady Helmsford, who is her mother's sister. Monteiro well knows of what her womanly jealousy would be capable were she to discover that, as she says, she has been supplanted by the daughter with Monteiro, as before-time the mother had supplanted her with Lord Langley. And indeed, when she does discover the truth, she acts as it might have been supposed she would, and sends Maud back to John Langley and all the perils included in such guardianship.

The men, too, act according to their natures, and again Maud is abducted by her cousin Harold, to be again rescued by her husband Monteiro, who brings the news of his own pardon and admission into the King's service, as well as of the restoration of his wife to the title and heritage of Langley. But, generous always, he leaves her free to renounce him even at this supreme moment, and would have quitted her for ever had not Maud's natural love for him burst forth. He therefore yields to her prayer to remain, and they are to be remarried on the morrow in a more binding and orthodox manner than before. This is the bare skeleton of the plot, in telling which we are doing the book no harm; for the interest of the story lies more in the working out of the characters than in the mere action of the drama. We are sorry to have to add that the author is at times unpardonably careless, and that she trips where a writer of her power and practice might be least expected to fail. Her grammar is not always faultless, her adjectives are sometimes redundant, she blunders in her use of foreign words, and she is not a good corrector of the press. Moreover, she commits the most astounding anachronisms, as when she makes one of her personages perform a sonata by Beethoven a good half-century before Beethoven was born.

FRENCH LITERATURE.

THE third volume recently published by Count Prokesch* completes the collection of Gentz's correspondence with the Hospodars of Wallachia. Austria, whose politics naturally have the foremost place in these despatches, was eager, before

* *The Heritage of Langdale*. A Novel. By Mrs. Alexander, Author of "The Wooing Ot," "Which shall it Be," &c. 3 vols. London: Richard Bentley & Son. 1877.

* *Dépêches inédites du Chevalier de Gentz aux Hospodars de Wallachie*. Publiées par M. le Comte Prokesch-Osten. Vol. III. Paris: Plon.

Napoleon's downfall, to preserve an attitude of armed neutrality, equally disliking an alliance with Russia and a nearer intimacy with France. Then came the idea of a coalition against the ambitious projects of the French Emperor, and the firm resolve on the part of the European Powers to restore old frontiers. It is a curious fact, abundantly proved by the work before us, that the allied sovereigns had not entertained at first the idea of dethroning Napoleon; on the contrary, they regarded the restoration of the Bourbons as an evil, and merely wished to conclude peace on the basis of the Congress of Châtillon. With reference to the Eastern question, which was already at that time occupying the attention of European statesmen, Gentz observes that the existence of the Ottoman Empire is essential to the independence of the West, and that it constitutes one of the most formidable checks on the ever-growing ambition of Russia. In 1823 and 1824 the Czar was absolutely opposed to any scheme implying the political freedom of Greece, admitting only for the Greeks a distinct civil administration, but fully determined on retaining an influence of which a system of autonomy would deprive him.

M. de Tréveret has been led in the course of his studies to devote much attention to Italian literature. He has taken the Italy of the sixteenth century as the subject of his lectures at Bordeaux, and now presents us with an elegant little volume* embodying the principal results of his teaching. Lying under the constant threat of invasion, and surrounded by three powerful nations which were watching the fittest opportunity to enslave them, the contemporaries of Machiavel had the misfortune of helping on by their dissensions the subjugation of the peninsula, and of postponing that political unity which has only just been realized. The development of this idea gives great interest to M. de Tréveret's sketch of Machiavel, the first and the longest in the volume. The author of *Il Principe* is certainly very little known to French readers; but still the praises bestowed upon him in modern times and the respect paid to his memory have helped to bring him somewhat into notoriety. But who has ever opened the works of Sannazar, or glanced at Castiglione's *Il Cortegiano*? Yet these two men are worth studying, because they give us a vivid and naïve picture of the Renaissance, and enable us to understand a phase of civilization which has often been misrepresented. M. de Tréveret's volume is written in a very agreeable manner, and is completed by an appendix containing, amongst other things, the original of a few of Sannazar's poems.

French literature boasts of two excellent works on the history of German and Italian philosophy; but it has not yet produced any tolerable sketch of modern French metaphysics. M. Damiron's two volumes are fifty years old, and therefore are out of date; the essays of M. Renouvier and M. Ravaisson do not aim at being anything beyond mere summaries dealing with generalities and avoiding details. M. Ferraz tells us in his preface† that he has entertained the idea of doing for his own country what MM. Wilm and Ferri have done respectively for Germany and for Italy. We hope that he will find time and strength to carry out his plan; in the meanwhile he has published a very interesting volume in which he treats of the schools of thought respectively headed by Saint-Simon, Fourier, Cabet, Pierre Leroux, Auguste Comte, and Proudhon. The naturalist group, exaggerated in the writings of Buchner, Moleschott, and Robin, is here identified with Gall and Broussais. M. Ferraz is justified in expressing regret that Frenchmen should have been so thoroughly absorbed by the political, administrative, and military history of the last seventy years as to forget to take notice of the evolution of philosophical theories; and it is high time that this deficiency should be supplied.

M. de Pontmartin's *Nouveaux Samedis*‡ have reached their fourteenth volume, and each instalment as it comes before us reminds us of works with which the public is already familiar. But M. de Pontmartin has the gift of bringing out the true character of the productions with which he deals, and there is always much to learn from his articles. If we are disposed to quarrel with him on the present occasion, it is about his severe article on M. Doudan. Critics may perhaps be justified in wishing that the two thick volumes of M. Doudan's correspondence had been more cautiously edited, and that the pruning scissors had been used with more judgment. But surely, in the midst of the questionable productions with which the French press teems just now, it is something to have to read a few hundred pages of common sense, elegant language, and witty remark. Does not M. de Pontmartin himself, in his article on M. Jules Simon at the Académie Française, deplore that the places formerly occupied by Bossuet, Voltaire, Guizot, Rémusat, &c., should now be filled by men like M. Charles Blanc? One of the best *causeries* in the volume is the last, devoted to Mme. Volny, who, under the name of Léontine Fay, was the favourite of all Parisian playgoers.

The biography of Alfred de Musset§ cannot fail to attract much attention; it is a great deal more than a simple monograph, and the details it gives as to the literary movement in France during the last half-century are extremely curious. M. Gustave Planche, M. Chaudesaigues, M. Buloz, Mlle. Rachel—all the leading stars of the Romantic school occupy their respective places in this interesting

volume. The readers whom the famous biographical novel *Elle et lui* justly scandalized some years ago, and who found M. Alfred de Musset signally avenged in *Lui et elle*, must now complete their information by turning to M. Paul de Musset's biographical sketch.

The "metropolis of the world," as M. P. Imbert calls Paris*, contains secrets which are not of the most attractive nature, and which few persons would care to fathom, if we may judge from the descriptions given in the volume before us. Eugène Sue had already introduced us in his *Mysteries of the tapis-frances* of the Faubourg Saint-Antoine, and had explained to us the composition of that culinary phenomenon a *Harlequin*. We might, however, be justified in supposing that the novelist was drawing on his imagination; but when we see a sober-minded person like M. Imbert ratifying the statements made by M. Sue, we are driven to suppose that such eating-houses as "L'Azart de la Fourchette" really exist. The chapters of this little volume treat of the most various subjects, and although they place before us pictures of a somewhat gloomy description, we have every now and then amusing bits, such as the essay entitled "A Matrimonial Agency," and the narrative of spirit-rapping experiences in the Rue de Charenton.

The anonymous writer to whom we are indebted for *Les femmes et la fin du monde*† has done a good service to French society. The subject with which he deals is not a pleasant one, but it required to be honestly and seriously treated. The morality of a nation depends in a great measure on the condition of its women; and it is equally certain that the moral and intellectual training of ladies in France is anything but what it ought to be. Many years ago, when grave philosophers and religious thinkers protested against the system adopted for the education of Frenchwomen, optimists shrugged their shoulders and laughed at the moroseness of would-be Catos who ignored the refinements of civilized life. The word of caution is now uttered, not by professed moralists, but by observers belonging to what is called fashionable society, who cannot help noticing facts which stare them in the face. What can be the latter end of a community in which girls brought up in the most thorough ignorance of anything like religion and high principle feed upon such literary rotteness as the novels of MM. Belot, Flaubert, and Zola? The picture is a melancholy one, but it deserves to be studied attentively by those who think that England would be all the better for the importation of Parisian manners.

The French occupation of Canada has left traces which still subsist, and after more than a century of English rule the population of what was called *La Nouvelle France* is still closely attached to the mother-country. M. Charles de Bonnechose has explained in an interesting little volume‡ the origin of the French possessions in North America, and, whilst giving the biography of General Montcalm, he shows by what train of circumstances Canada fell into the hands of the English. This chapter of colonial history is still little known, at least in its details, and it is only quite recently that the exploration of the French War Office and Admiralty records, together with the study of the documents collected by Canadian writers, has thrown light upon the public career of Montcalm. M. de Bonnechose has performed his task remarkably well, and the two maps which end the volume add materially to its value.

After having given us the history of France during the reign of Louis XV., M. Jobez now attempts to describe the last days of the *ancien régime*, and to estimate the government of Louis XVI.§ His first volume is taken up by an account of Turgot's administration, and of the reforms which that Minister endeavoured to bring about. One of the principal facts which strike us in the history of that period is the growing estrangement of the nation from the King. The only theory capable of justifying absolute monarchy as it existed in France had been inapplicable since the middle of the reign of Louis XIV., and face to face with a system which was rotten to its core stood public opinion daily gaining in strength, loudly calling for reforms, and insisting upon being heard. M. Jobez shows in minute detail what the Court of Versailles was in 1770, describes the contending influences of Marie Antoinette on the one side and of the anti-Austrian party on the other, and dwells upon the egregious blunder which the King committed when he dismissed Maupeou. The work of M. Jobez is written from the liberal point of view, and will be found valuable; but the author has adopted too gossiping a style, and seldom refers to the sources which he has consulted.

M. l'abbé Chevalier has lately published the first part of a work which will be of great service to students of mediæval history.¶ The *Répertoire des sources historiques* is to consist of three volumes, representing three distinct works; and the lexicon now in course of publication gives in the briefest possible form the biography of all the persons who have risen to any celebrity during the epoch included between the establishment of the Christian Church and the end of the fifteenth century. Each article comprises two divisions; the former, the biography properly

* *L'Italie au seizième siècle*. 1re série. Machiavel—Castiglione—Sannazar. Par M. de Tréveret. Paris and London: L. Hachette & Co.

¶ *Répertoire des sources historiques du moyen âge*. Par Ulysse Chevalier. Vol. I. Paris: Société Bibliographique.

so called, is limited to a few dates and leading facts; the latter indicates, as completely as possible, the sources of information—special monographs, essays or disquisitions, &c. Thus, by referring to M. Ohevalier's dictionary, any person wishing to write a Life of St. Bernard, for instance, will find at a glance a list of all the works published about him, down to M. Patriat's trifling article inserted in the *Bulletin du bouquiniste* for 1870. The volume is admirably printed.

M. Bougot has written an elaborate volume on art-criticism.* He is struck, he tells us in his preface, by the random, haphazard manner in which critics often discharge their task; they seem to have no leading principle to guide them, and in proportion to their incompetence is the arrogance with which they deliver their oracles. How is this state of things to be remedied? In answer to this question, M. Bougot begins by describing the relations existing between criticism on the one side, and aesthetics, technology, and the history of art on the other; he then discusses the share which each of these elements should have in shaping our judgment, and he devotes the second part of his book to a brief sketch of the history of art-criticism in France from its origin, two centuries ago, to the present time. The conclusion he arrives at is that all sound appreciation of a work of art should combine the science of a metaphysician, the taste of an artist, the imagination of a poet, and the technical knowledge of an historian. M. Bougot certainly does not make things too easy to the critics.

The monograph composed by M. B. Hauréau† is a curious chapter, so to say, detached from the history of the Albigenses, and it throws a good deal of light on the character of the persecution which brought about, as a final result, the destruction of Languedoc civilization. We see the jealousy of two orders of monks breaking out in open hatred, followed by sentences of excommunication. Bernard Deltieux, the unfortunate victim on this occasion, is charged with abetting heresy, whereas he merely constitutes himself the champion of a good man who had edified the south of France by his virtues. Far in advance of his age, he was bold enough to blame his superiors, and the freedom of his opinions procured for him the character of a reckless and daring agitator. Bernard was finally brought to trial, and condemned on the threefold charge of having stirred up the country against the authority of the Inquisition, conspired against the King of France, and procured the death of Pope Benedict XI. by poison. The narrative of this episode in mediæval history illustrates vividly the power of the Romish Church, and especially of that dreaded tribunal which was established to decide on cases of heresy. M. Hauréau has given in an appendix the principal documents bearing on the trial of Bernard Deltieux.

Mrs. Craven has devoted a small volume to one of the *dramatis personæ* of the *Récits d'une sœur*‡. There cannot but be some interesting, and especially some edifying, pages in the biography of a Sister of Charity, and we have no doubt that the life of Mlle. Narischkin will be popular amongst a certain class of readers. At the same time we suspect that the public in general is becoming rather tired of hearing about the excellent persons of what we may call the Swetchino type; and the charm which pervades Mrs. Craven's earlier work will suffer if an attempt is made to spread it over a number of supplemental biographies.

M. Emile de Girardin has collected, under the title *La question d'argent*§, a number of articles on the most various subjects. Short notices of the Countess d'Agout and of George Sand appear in close proximity to papers on the Postal Union, the Senate, and the working classes. The volume derives its title from some of the essays in the second part, which treat of the Turkish question, the disarming of Europe, the attitude of Russia, and the state of finances as affected by the present condition of foreign politics. M. Emile de Girardin looks about him, and the result of his survey is extremely sombre. He thinks that we should not be deceived by the apparent prosperity of France. Just now a paper currency is in favour, but at the first rumour of war there must, he says, be a general bankruptcy, and the law of 1870 which authorizes the Bank of France to refuse payments in specie shows that notes may in the course of twenty-four hours become utterly valueless if the political weather-glass should point to storm. Economy is absolutely necessary throughout Europe; there is not a State which is not crushed under the weight of loans and taxes; and the problem to be solved is how to retrench the enormous expenses entailed by the keeping up of standing armies, and to devote all available resources to the development of industry in its many forms—roads, canals, manufactures, commerce, &c. Education also must be encouraged and subsidized, for, as we are happy to learn, the people who now rule by virtue of universal suffrage will not sanction wars of conquest and territorial annexation if they can appreciate the blessings of intellectual culture. It may be admitted that M. Emile de Girardin's new collection of newspaper articles contains some matter that is sound and practical, but he mixes up with it a considerable amount of sensational verbiage.

Works on scientific subjects abound. We may mention first M. Bourlet's educational treatise written from the Positivist point of

view*, and introduced by a preface from the pen of M. Charles Robin. This volume, which has now reached a second edition, acknowledges indeed the good which has been done in other days by the teaching of Christianity, and condescendingly admits that man is even now a religious animal; but the author maintains, agreeably to the doctrine of Auguste Comte, that collective humanity is the only divine being in the universe, and that a normal system of education must repudiate as obsolete the notions of the supernatural, of providence, and metaphysics in general.

M. Louis Figuier's popular handbook† keeps up its character for accuracy, usefulness, and completeness. Under its several subdivisions of astronomy, meteorology, physics, pure and applied science, &c., it gives a brief sketch of recent discoveries and improvements; the principal meetings of learned Societies are also duly reported, and a biographical chapter supplies short notices of the most distinguished men of science who have died during the course of the year 1876.

The knowledge of the numerous insects which destroy vegetation is of the utmost importance to agriculturists, who need for their guidance a compendious treatise of a practical character, stripped of scientific technicalities, and giving merely the principles and the facts which every one ought to know. This want M. Rondou has supplied in a little volume‡, copiously illustrated, and compiled from the works of the best entomologists, both French and foreign.

We are told that the new book§ of M. Sacher-Masoch has created great irritation in Germany; which is not much to be wondered at. Prussians and Austrians are described by the author of the *Contes galiciens* in somewhat disagreeable colours, and he has made fiction the means of apprising his readers that *ces bons Allemands* have all possible vices. M. Sacher-Masoch is a vigorous writer, full of originality, and his book, independently of its political tendencies, has all the qualities of a good novel.

M. Dufan is already known by an excellent treatise on the education of the blind, published some twenty years ago under the title *Souvenirs et impressions d'une jeune aveugle née*, a work of which the second edition is now before us.¶ Whether it is a novel or the *bona fide* memoirs of a blind girl is not quite clear; at any rate the volume is well worth reading, for, in addition to the dramatic element it contains, the author has managed to discuss incidentally a number of questions bearing upon education, ethics, and even metaphysics. He explains with much force how the loss of one of the senses affects the development of the passions, and shows the law of compensation acting in the case of the blind. If these interesting *souvenirs* are not real, they have unquestionably a stamp of reality which must strike every reader.

The memoirs of the gentleman who has adopted "Pervacques" as his *nom de plume* are neither edifying nor amusing; his heroines belong to the *demi-monde* of all countries; but the volume is readable, which is more than can be said of M. Emile Zola's novel, *L'assommoir***, six hundred pages of garbage given as a work of philological and moral pretensions.

* *Principes d'éducation positive*. Par le Dr. Bourdet. Paris: Germer-Baillière.

THE CRISIS.

THE question of peace or war is not yet finally decided; but there is at present every reason to fear the worst. The Turkish Government has rejected the Protocol; the Turkish Parliament has refused any cession of territory to Montenegro; and consequently the conditions attached in Count SCHOUVALOFF'S Declaration to the disarmament of Russia have not been even partially satisfied. If the war which is now generally expected ensues, it will have become certain that the late diplomatic operations were intended by Russia to result in failure. Political observers were during the whole course of the controversy perplexed by the concurrence of two conflicting improbabilities. It was equally difficult to explain the vast military preparations of Russia except on the assumption that war was imminent, and to account plausibly for the elaborate efforts of General IGNATIEFF and Count SCHOUVALOFF to obtain the assent of the Great Powers to a document which seemed preparatory to peace. On the whole, the preponderance of conjecture expressed itself in the hackneyed illustration of a bridge by which Russia might retreat. Sanguine politicians hoped that some at least of the military rumours were untrue; and a credulous section persisted in repeating the official statement that the Emperor ALEXANDER was sincerely desirous of peace. There is no discredit in failure to decipher the secrets of powerful and unscrupulous Governments. It now seems that the Protocol and its attendant documents were designed to occupy the time during which the roads in South-Eastern Europe are becoming passable to an army. If an affront has been offered to the Powers, and especially to England, the Russian Government is justified in the belief that no possible irritation will embody itself in the form of material aid to Turkey. It is, after all, still barely possible that some new method of preserving peace may be devised. It has been long foreseen that the ultimate solution would correspond with the secret purposes which have long been entertained by Russia. The mystery is not yet finally disclosed, though it seems almost certain that war was intended from the first.

The Protocol and the accompanying Declarations have been subjected to much reasonable criticism. The supposed agreement with Russia did little or nothing for the Christian subjects of the Porte; it might be so construed as to impose vague responsibilities on England; and there was no doubt that it virtually repealed a principal article of the Treaty of Paris. It is true that its defects were provisionally counteracted by the defeasance inserted in the covenant by Lord DERRY. If Russia failed to accomplish a disarmament which had not been promised, the Protocol was at once avoided as far as it affected the English Government. On the other hand, the Russian Ambassadors enumerated a series of concessions which were to be made by Turkey before the disarmament was to commence. The Porte was to agree to a simultaneous and preliminary disarmament; peace was to be made with Montenegro; and a special Envoy was to be sent to St. Petersburg to negotiate the matters in dispute. It was evidently in the power of Russia to ensure the non-performance of the conditions, and consequently to maintain absolute liberty of action; but even sceptical minds were unwilling to believe that the IGNATIEFF mission and the subsequent negotiations had been deliberate impositions. Those opponents of the Government who are not partisans of Russia complained that the entire result of the negotiations had

been a diplomatic triumph to Russia, achieved in one sense at the expense of the unhappy Bulgarians. The English Government, which was probably better informed than the general community, was not content with the partial security for peace which it was thought to have attained. The strongest pressure was placed on the Porte to make all the concessions which might be demanded by Russia; and the pardonable fiction that the Protocol and the Declarations involved no humiliation to Turkey was confidently propounded. The other neutral Powers may perhaps have seconded the efforts of the English Chargé d'Affaires with the same result of failure.

The proceedings of Russia after the signature of the Protocol took all Europe by surprise. The journalists were at once unmuzzled and let loose to threaten Turkey and to utter defiance to England. At the same time Prince GORTCHAKOFF required from Turkey the instant acceptance of the Protocol, and the fulfilment of the conditions enumerated in Count SCHOUVALOFF'S Declaration. The line of insult which was deliberately adopted was evidently intended to provoke the refusal which has almost been forced upon the Porte. It would undoubtedly have been more prudent to submit to the dictation of a superior enemy, and to force Russia to invent some new pretext for the meditated war of conquest; but Turkish Ministers are not always cautious or patient; and the calculations of Russia were not falsified by the event. Simultaneously with the issue of Prince GORTCHAKOFF'S despatch, the newspapers were filled with reports of additional preparations for war; and possibly some of the official statements may have happened to be true. The design of alarming, bewildering, and offending the Turkish Government was almost openly avowed. The only tribute which was paid to morality or decency consisted in the effort to force Turkey into the first announcement of a rupture. The object has not yet been fully attained; but it will be easy to represent the rejection of the Protocol and of the Russian demands as a virtual declaration of war. Students of the history of NAPOLEON as recorded by LANFRET, or even by THIERS, will recognize the familiar phrases in which the wolf remonstrates against the encroachments of the lamb. It is scarcely imaginable that this phase of Russian diplomacy should, like all the rest, dissolve into an illusion. It is dangerous to use bluster in contention with an adversary who is more prone to resentment than to fear. Intimidation has failed more than once during the recent crisis, and the Turks are perhaps encouraged by perception of the wilful perversity with which the Russian Government has placed itself in the wrong. The morrow of the signature of the Protocol was not a well-chosen occasion for casting diplomacy to the winds.

It is still not absolutely certain that Russia has resolved to make war. The Imperial Government may, if it thinks fit, make a new display of moderation by once more appealing to the European Powers to join in measures for the coercion of Turkey. It will be easy to represent the deliberate rejection of the Protocol as an affront not only to Russia, but to all the signatories of the document. If an interval of time is provided before the advance of the Russian army, England at least will lose no chance of preserving peace, even when success seems difficult or impossible. For the present it will, if negotiations are continued, not be necessary to explain in diplomatic communications that the actual crisis has been wilfully forced on by Russia. The Turkish Government has, like many other controversialists, answered the meaning or the con-

duet, and not merely the language, of an adversary. No impartial critic of Prince GORTCHAKOFF'S despatches could doubt that he meant to impose on Turkey the alternative of war or of humiliating submission. The balance of probability is now against even the temporary postponement of a declaration of war. As soon as uncertainty is at an end the Opposition will by some formal motion challenge the policy of the Government; and their leaders will not be at a loss for plausible accusations and effective taunts. It will be said that, of the three objects of thwarting Russian ambition, of amending the condition of the Christian subjects of Turkey, and of preserving peace, not one has, after the laborious negotiations of a year and a half, been approximately attained. The defence of the Government, if it is judiciously conducted, will consist in the proof that success was impossible without the use of force. Mr. GLADSTONE and his friends will reply that joint coercion would have both secured the submission of Turkey and provided means for the effective protection of the Bulgarian Christians. Russia, it will be said, goes unwillingly to war, because England refused to share in assuming a European Protectorate. It cannot be denied that such a policy might perhaps have produced results which would have been acceptable; but the uncertainties and the possible failure of measures which have not been tried must also be taken into consideration. The best apology for the Government is that, while joint action was still possible, the Opposition shrank from pledging itself to a course which would probably not have found favour with the country. The Ministers could not be expected to run risks for which their opponents would not even accept a hypothetical responsibility.

THE BUDGET.

SIR STAFFORD NORTHCOTE deserves credit for his simple Budget and his unpretending speech. In former times his ingenious predecessors have sometimes taken the opportunity of a balanced account to alter the system of taxation by supplying defects which had in the first instance been deliberately created. Sir STAFFORD NORTHCOTE had no money to spare, and he therefore gave nothing away; and, having no immediate need of money, he made no new demand on the taxpayer. The revenue is estimated at somewhat over seventy-nine millions, and the expenditure at nearly the same amount; for, according to modern notions, a surplus of 300,000*l.* scarcely deserves notice. It must be remembered that the estimates of expenditure include a not inconsiderable contribution to the capital account in the form of payment of debt. It would have been highly unsatisfactory to meddle with a Sinking Fund which was established only two years ago, as there was no urgent necessity for committing a financial irregularity. Mr. LOWE'S confident assertion that the Sinking Fund would be appropriated to the purposes of the first Chancellor of the Exchequer who found himself in difficulty was one of those prophecies which tend to defeat themselves. The House of Commons is less likely to be unstable when it has been publicly accused of caprice. According to the CHANCELLOR of the EXCHEQUER, no less than 15,000,000*l.* have, since the accession of the present Government, been employed either in the reduction of debt or in some other form of capital expenditure. If the statement is accurate, the charges of extravagance which are sometimes preferred against the Government by political opponents admit of an effective answer. The financial policy of both parties is in truth the same. It is impossible to conjecture the course which Lord BRACONFIELD might adopt if he were to encroach on the province of the CHANCELLOR of the EXCHEQUER. He has the good sense to leave Budgets to be arranged by a colleague who understands finance, and the result is in the present instance satisfactory.

Although the small surplus of the year which now closes was produced by an accident, the chances are greatly in favour of at least as good a result in the year for which provision is made in the Budget. The mere increase of population affects the produce of the indirect taxes; and there is some reason to hope that industrial and commercial activity may partially revive. The imports of raw material indicate the anticipation by manufacturers of a more active season; and it is a remarkable fact that the tonnage of ships built during the last twelve months is

considerably larger than that of the previous year. On the other hand, pauperism is unfortunately once more increasing after a long period of decline; and it may be conjectured from the late fall in the Exchequer revenue that wages at last tend to follow the diminution of profits. The CHANCELLOR of the EXCHEQUER is as unable as the mass of the community to anticipate the future with certainty; but he commands the best sources of information, and the opinion which is expressed in his speech and implied in his policy forms one of the materials of a probable judgment. Sir STAFFORD NORTHCOTE is thoroughly imbued with the orthodox traditions of his office; and he would encounter a certain amount of inconvenience and unpopularity in preference to the alternative of a probable deficiency. It is well that financiers and skilled administrators in general should cultivate a professional conscience, and adhere obstinately to general rules. The soundness of the English financial system is mainly due to the abhorrence of deficits which has been felt by many successive Ministers. The easy process of filling up a margin by loans leads to every kind of laxity and abuse. Nevertheless, the risk of a nicely balanced Budget is not so great as to defy calculation. The worst that could happen if the estimates of revenue proved to have been too sanguine would be a trifling increase of the floating debt. A year hence there will be abundant means of judging whether the late failure of elasticity is temporary or permanent. Even if it should unfortunately have been found necessary to provide a supplement to the revenue, Sir STAFFORD NORTHCOTE or his successor can make provision in the next Budget for the repayment of any advance.

In a depressed season it is allowable to regret the profuse liberality with which taxation has been remitted whenever the revenue has exceeded the expenditure. Former Chancellors of the Exchequer, while they readily listened to demands for relief, practised the pious fraud of understating their expectations; and consequently they had for the most part a margin which was applied under the provisions of the law to the redemption of debt. In case of need the same sum afforded a security against an unforeseen reduction of receipts. Only four years ago Sir STAFFORD NORTHCOTE had the disposal of a surplus of six millions, which he increased to a certain extent by an alteration in the mode of keeping accounts. His opponents sometimes accuse a Conservative Government of having frittered away a Liberal surplus, forgetting that Mr. GLADSTONE had disposed in advance of more than the whole amount by the proposals of his election address. The part of the surplus which was presented to the ratepayers in aid of local expenditure might perhaps have been prudently retained; but both parties were then pledged to the same questionable policy, and the Government would not have been supported by its followers in a repudiation of the promises of the former Ministry. Mr. LOWE had also rendered necessary the abolition of the small remnant of the sugar duty; and a considerable addition to the expenditure had been incurred by the abolition of army purchase. On the whole, it may be confidently asserted that the fiscal condition of the finances has little or no connexion with politics or with party.

Sir STAFFORD NORTHCOTE courteously said in his reply to some desultory comments on his Budget that the discussion had been extremely interesting. He was perhaps more inclined to do justice to his critics because their judgment had on the whole been favourable. Some authorities in finance expressed a fear, which cannot be called unreasonable, that the CHANCELLOR of the EXCHEQUER had been too sanguine in his anticipations of revenue. It is possible that his calculations may be falsified by the result; but he has for the first time in many years assumed that there will be a falling off in the receipts from both Customs and Excise; the increase which is expected from the Post Office will almost certainly accrue; and perhaps it might have been allowable to anticipate some further profit from the telegraphs. Mr. CHILDEMS, Mr. GOSCHEN, and Mr. BAXTER naturally desired to place on record their doubts whether Sir S. NORTHCOTE might not have been unduly sanguine; but probably any one among them, if he had been responsible for the Budget, would have adopted the principle of letting well alone. The suggestion which was lately made of an addition to the spirit duties has received no support; and the more probable alternative of an increase of the Income-tax would have involved serious hardship. There could, of course,

be no excuse for repealing even the smallest tax when the attainment of an equilibrium is not absolutely certain. It fortunately happens that there has of late been no agitation against any existing burden except the railway passengers' tax. Both travellers and shareholders must be well aware that an immediate application of relief would have been at the same time hopeless and impolitic. Within the next two or three weeks it is possible that the representatives of other interests may, as if for the purpose of barring a Parliamentary statute of limitations, remind the House of Commons of claims to be preferred in more favourable seasons. No serious controversy will arise either on the principles or the details of the Budget. The only anxiety which had been previously felt related to a possible increase of taxation; and Sir S. NORTHCOTE was more considerate than some of his predecessors in making, before he had arrived at the middle of his statement, the welcome announcement that things were to remain as they are. The disclosure was rhetorically judicious, because it left the House of Commons at liberty to listen with a mild satisfaction to detailed accounts of the operation of the Sinking Fund, and to the reform which is to be introduced into the administration of Savings Banks. The general result of the statement and the discussion will certainly not tend to weaken the Government.

PRINCE BISMARCK.

THE end of Prince BISMARCK's resignation is that he has not resigned, but is to have a long holiday. The EMPEROR naturally feels that he cannot do without his great adviser to keep him right, and the announcement of the PRINCE's resignation caused such dismay in Berlin that the country evidently shares the feelings of the Sovereign. Some difficulty appears to be felt as to the proper mode in which he is to be temporarily replaced; but this must be purely a matter of form. Whoever may replace him, it is obvious that the one business of his substitutes must be to do nothing; for, if they did anything, they must consult him, and, if they consulted him, they would spoil his holiday and deprive him of all chance of regaining health. As far as its domestic concerns go, Germany must share the holiday of its CHANCELLOR, and, as to its foreign affairs, whether he resigns, or takes a holiday, or continues at his post, Prince BISMARCK must guide them as long as he lives. There was much to be said for the proposal of the PRINCE that the Prussian and German Parliaments should for a while see how, in the sphere of domestic business, they could get on without him. It might have been a useful preparation for the day when they must manage for themselves as well as they can. But it is perhaps natural that they should shrink from trying the experiment so long as it is possible that he should any day come back and explain to them how badly they have been doing their work. Foreign affairs, too, have in the last few days taken so very serious a turn that Germany may be excused for thinking that the present is not a time when domestic affairs can be expected to occupy a large share of their attention. The position of Germany is at this moment one of so much anxiety that the nation may well be wrapt up in it, and find no other consolation than that which the thought that Prince BISMARCK is at hand to direct affairs can give. It is said, for example, that France and Italy joined Russia in pressing for an answer from Turkey before a specified day, and this co-operation of three of their neighbours may give Germany matter for serious reflection. It is easy to exaggerate the importance of what may be an accidental trifle; but when France, Italy, and Russia, on what seems to be the eve of a war, take a line in any way divergent from that adopted by Germany and Austria, it must be a comfort to perplexed Germans to know that Prince BISMARCK is watching over them, and will see that no harm shall happen to them that human skill and courage and foresight can avoid.

Prince BISMARCK's old adversary Count ARNIM has once more come before the public with a small volume in which he endeavours to show that he was very badly treated by the PRINCE in March, 1873, when negotiations were going on for an early evacuation of France. As one of the grounds of accusation against Count ARNIM on the occasion of his recent extraordinary trial was that during these negotiations he had so culpably mismanaged matters as to have prejudiced the interests of his country, he is quite right to show, so far as he can, that the accusation is

not in any way warranted by the facts. Everything connected with that trial is open to the severest criticism. It was perfectly ludicrous to give the grand name of high treason to the worst of Count ARNIM's errors. The trial was conducted in secret, so that the real merits of the case were concealed from the world; and the sentence was absurdly severe. All that can be said for Prince BISMARCK is that it is more perhaps the fault of his country than of himself that bad laws and bad tribunals should have made such a perversion of justice possible; while on behalf of Germany it must be remembered that the Parliament has very recently marked its sense of the injustice of the ARNIM trial by fixing the Supreme Court of Appeal at Leipzig instead of Berlin. If in his now publication Count ARNIM's object is to show that nothing he did in the spring of 1873 could by the wildest misconception be considered a ground for an accusation of high treason, he will have proved his point to the satisfaction of every impartial reader. But, if it is merely asked whether his account of the negotiations of 1873 is calculated to raise his professional reputation, a question is raised which it is not very easy to answer. In one way Prince BISMARCK did not treat him well. While he was charged with the task of negotiating with M. THIERS at Paris, Prince BISMARCK behind his back negotiated separately with M. THIERS, both through General MANTEUFFEL at Nancy and through M. GONTAUT BIRON at Berlin. But Count ARNIM gave Prince BISMARCK some provocation. His notion of his position was that he was a negotiator appointed directly by the EMPEROR to negotiate, and, as he thought at the time, and says now, he was a much better negotiator than Prince BISMARCK was. He had a plan of his own, which he thought Prince BISMARCK was spoiling. He never pretended that he had any right to disobey Prince BISMARCK's positive orders, but he construed the PRINCE's orders so as to make them fall in as much as possible with his own views. If he had really desired to carry out the wishes of the head of the Foreign Office, he might have ascertained in an hour or two by telegram what those wishes were. He would have asked for instructions on the points as to which he professed to doubt. Instead of doing so, he reserved to himself all the latitude which any doubts could create, so as to retain his independence, and negotiate as he thought best. Technically speaking, Count ARNIM was so far right that he cannot perhaps be said to have committed any one grave and indisputable fault; but he never co-operated with Prince BISMARCK as a zealous subordinate co-operates with a chief whom he respects.

The ARNIM incident is worth studying in all its bearings, as it furnishes a clue to much that is otherwise obscure in Prussian life, in Prince BISMARCK's history, and in the troubles which have led to his present desire to quit his position for a time. Count ARNIM asks what seems to be a very pertinent question. He inquires why, if Prince BISMARCK was not satisfied with him in 1873, he did not then ask the EMPEROR to remove him from the Paris Embassy. The simple answer is that the PRINCE could not have asked the EMPEROR to remove him. To do so would have been contrary to the traditions of Prussian administration. The theory of this administration is that all the higher officials hold their offices directly from the Sovereign, and one cannot be removed because another, although nominally his superior, does not like him. To obtain his removal it is necessary to make out a case against him, and in 1874, when Prince BISMARCK had, as he thought, got a case against Count ARNIM, he submitted it to the EMPEROR, and Count ARNIM fell into disgrace. This case was very highly charged, and made out Count ARNIM to be a much worse man than he really was. Instead of saying, which he might have said with perfect truth, that Count ARNIM was a vain, fussy, impracticable man, ill suited for the conduct of grave affairs, and particularly ill suited for a post like that of Ambassador at a critical time, Prince BISMARCK informed the EMPEROR that the COUNT sacrificed public to private interests, and was so notorious for want of truthfulness that no one in London would believe a word he said. These were serious charges, and, so far as is known, were undeserved, although it must be said that M. THIERS complained of the double dealing of Count ARNIM, and Count ARNIM has shown a want of straightforwardness as to the authorship of some recent publications attributed to his pen, which is much to be regretted. Having once made a case against Count ARNIM, Prince

BISMARCK was impelled to substantiate and aggravate it, until at last he was led to making his victim amenable to the ridiculous charge of high treason. What has happened in Count ARNIM's case has happened in others, and Prince BISMARCK has crushed other officials of whom he wished to get rid. But he cannot crush every one who thwarts him, and he finds in the official world constant obstacles interposed in the way of what he desires being carried out. It is not surprising that he is sometimes wearied to death of such a position, and that the strain of a series of small contests and small disappointments tells on him. Although he is far abler in every way than any other German official, he is no doubt often wrong, and other officials are right. But the difficulty that presses on him is that, however right he may be, other officials can thwart him, unless he can make out a case which will justify their removal. Probably he could now, if he were to exercise his whole influence, get his way in anything he desired; but he cannot exercise such an influence except on rare occasions, when he thinks it worth while to have a contest out and show that he is supreme. High office on such terms is hard work for a man who burns to do great things, and to do them rapidly; and, if any statesman in Europe ought to enjoy a holiday when he gets it, it is Prince BISMARCK.

THE IRISH OBSTRUCTIVES.

MR. BIGGAR, and in a lesser degree Mr. PARNELL, may fairly plume themselves on being the successes of the Session. They have essayed more than mortal member ever essayed before, they have accomplished more than mortal member ever accomplished before. No man has surveyed legislation with so extensive a view as Mr. BIGGAR; no man, except Mr. PARNELL, has maintained a point of order against the Chairman of Committees, the sense of the House, and the plain facts of the case, and ended by getting his amendment accepted by the Government. But their greatest triumph was on Monday last. The Mutiny Bill had been delayed by a discussion on the status of militia officers, and it was past midnight before the SPEAKER left the chair. The clauses of this particular Bill seldom vary from year to year, and there was no reason why in a single well-spent hour very great progress should not have been made with it. Mr. PETER TAYLOR had delivered himself of his customary protest against doing anything after twelve, and, this trifling form having been complied with, Mr. HARDY naturally expected to find the field clear. He little thought that the twin Irish obstructives had determined to test their empire over the House by watching the result of their simple appearance on their legs. Mr. BIGGAR and Mr. PARNELL successively supported Mr. PETER TAYLOR's objection, and the SECRETARY of STATE at once gave way. He knew too well what would happen if he held out. Division would have followed division, until at length the Government would have been forced to accept at three o'clock the adjournment which they had resisted at one. No wonder Mr. HARDY shrank from the unequal contest. After midnight time and the forms of the House of Commons fight with terrible effect for the obstructives. They have certain victory before them if they have only the persistence to fight on, whereas a very little resistance can make it impossible for the Government to win. When once the small hours have been reached, the only chance of getting through business is to eschew speeches and divisions. A single member who is resolved to speak and resolved to divide must inevitably get his own way in the end.

The tactics of the Irish obstructives would be amusing if they were not so exceedingly inconvenient. There is quite enough of uncertainty in the progress of legislation without its being aggravated by the consistent opposition of men like Mr. BIGGAR and Mr. PARNELL. With the best intentions a Minister is constantly unable to push measures on as fast as he wishes, and if they have at all fallen behind, his only plan is to snatch every opportunity of getting them advanced a stage. If Mr. BIGGAR or Mr. PARNELL stand ready with a motion that the next step, whatever it is, be taken that day six months, the flow of such opportunities is at once checked. There is an end to those quiet half-hours in which members enough to make a House can be kept within call, and a Bill be hurried through Committee without a division and almost without a remark. Every time that the Bill appears on

the notice-paper Mr. BIGGAR or Mr. PARNELL appears there as well. They are like the inconvenient sprites of their native land from whom there is no escaping, and whom the victim finds it the best philosophy to accept as something as inevitable as the weather or the flies. Mr. HARDY seems to be in excellent training for the assumption of this resigned attitude. He may even come in the end to feel a positive pleasure in the reflection that at the worst his night's work will be over in fair time. No Government can be held answerable for failing to pass measures which have to be carried over Mr. BIGGAR's body. If he chooses to throw himself in the way of useful legislation, the Government may fairly plead that the responsibility rests with him. But the public has an interest in this question superior to that of any Government, and it is this interest that is attacked by Mr. BIGGAR and Mr. PARNELL. Legislation is not simply a record of the scores which the Cabinet has made during successive Sessions; it is the application of appropriate methods of treatment to particular ailments of the body politic. Mr. BIGGAR seems to have determined that, so far as he has the power, the body politic shall go untreated. The relation between the thing which needs to be done and the measure by which it is proposed to do it is often so problematical that Mr. BIGGAR may in the end cause very much less mischief than he hopes and desires to cause. But the resistance which he seems bent upon opposing to every Government measure is so entirely unconnected with the nature and contents of the measure that there is no reason to suppose that his activity will be restricted to legislation with which the public might dispense without much loss. Indeed it is probable that the glory of obstructing a Bill of really vital consequence would have even more charm for him than the humbler distinction of obstructing Bills about which nobody cares very much whether they are passed or not.

It must be admitted that the prospect is a discouraging one. There are men who are amenable to argument or remonstrance, who can be convinced that the course they are pursuing is unworthy or inconvenient, and who may not in the end carry out their own threats. But neither Mr. BIGGAR nor Mr. PARNELL appears to be made of this pliable stuff. Indeed, for a man to be open to reason, he must almost necessarily have some reason for what he proposes to do. In that case there is a chance of showing him that he has not chosen his means well, and that he may attain his end more surely by another road. But the Irish obstructives seem to have no motive in what they do, except indeed so far as the desire of giving the Government and the House of Commons as much annoyance as possible can be called a motive. Supposing this to be their aim, it is impossible to prove to them that their tactics are not annoying, because the very attempt to induce them to abandon them is an admission that they have found out how to make themselves disagreeable. If there is any one on this side of St. George's Channel for whom they have any respect, it is Mr. BUTT, and Mr. BUTT has already failed in dissuading them from the intentions of which they have given evidence. If he cannot move them, it is certain that no one else will have any better success. Nor is there much chance that their constituents will resent the line taken by their representatives. They may grow tired of Mr. BIGGAR and Mr. PARNELL on other grounds, and may refuse to return them at the next election; but, if their rejection is not based on the fact of their being obstructives, there will be no certainty that their successors in the confidence of these fickle electors may not be eager to distinguish themselves in the same fashion, and to prove that, while they are the superiors of Mr. BIGGAR and Mr. PARNELL in other ways, they are not inferior to them in the characteristic which has been the foundation-stone of their fame. Of course there are methods of checking obstruction which it is in the power of Parliament to resort to; but they have, one and all, the vice of being more injurious to the public interest than the evil against which they would be directed. It must not be forgotten that there are occasions on which obstruction is a perfectly sound policy, and no means of silencing Mr. BIGGAR is likely to be discovered which would not be equally efficacious in silencing men of very different character and purpose. The example of the United States serves to show that, if there can be "filibustering" on the part of a minority against a majority, there can be equal tyranny on the part of a majority over a minority. The obstructiveness of a minority, purposeless and inconvenient

as it may be, can at worst only prevent a good measure from being passed. But the determination of a majority to put down obstruction, if the forms of the Legislature are such as to give scope for it, may lead to bad measures being passed without discussion. This is in almost every conceivable case the greater evil of the two, and for this reason it is better that the House of Commons should endure Mr. BIGGAR and Mr. PARNELL, intolerable as they threaten to become, rather than, by introducing any of the modes of cutting short a debate with which other Legislatures are familiar, lessen one of the chief safeguards that exist against hasty and vicious legislation. After all, man is a changeable being, and even Mr. BIGGAR may in time grow tired of being the standing nuisance of the House of Commons.

FRENCH TARIFFS AND ENGLISH TRADE.

THE failure of Messrs. FINZEL and SONS of Bristol is sure to attract much attention and sympathy, not only because the stoppage of large works brings ruin and misery on a number of innocent people, but because the misfortunes of the firm are not to be ascribed to any want of capital, good management, or attention to the sound principles of business, but are entirely due to the fiscal arrangements of foreign countries, and especially of France. The founder of the house was a German, who, being drawn for service in the armies of NAPOLEON, escaped to Heligoland, and thence to London, where he obtained employment in a sugar refinery. His ability led to his rapid progress in life, and he ultimately became the founder of the works at Bristol which have now been closed, and the large fortune he transmitted to his descendants has been fruitlessly expended in a vain struggle against foreign competition. France gives French sugar-refiners a bounty on exportation that enables them to undersell English manufacturers, and Belgium and Holland follow the example of France. The English refiners have made a good fight. They refused to own themselves beaten. They tried to make good their ground by improvements in machinery and rigid economy in expenditure. But their rivals did what they did, introduced modern appliances, and attended to every detail with the minutest care. In the end there was always this weight of the bounty against the English refiner, and the burden has at last proved too heavy for a rich, prudent, and enterprising firm like that of Messrs. FINZEL. The Counterslip premises where the operations were carried on are said to have been the most extensive of the kind in England. Six hundred hands were employed; twelve hundred tons of sugar were turned out a week, and a fleet of sixty vessels was engaged in transporting the supplies of raw material. The firm is ruined, the works are closed, the hands are starving, the ships are laid up, for no other reason than that a set of private persons whose conduct has been blameless have been beaten in a pecuniary contest by the wealth of a nation. It is France that pays the bounty, and it is by France, with the boundless resources of a great nation, and not by French manufacturers, that the English firm has been undersold. It is the peculiar features of the case that make it interesting. The suffering caused by the stoppage of Messrs. FINZEL's works at Bristol is far exceeded by the misery attending the paralysis of other branches of trade. The industry of sugar-refining is not a large one as industries go in England. Eight years ago it was calculated that the refineries in the kingdom numbered fifty, and that the capital engaged was a million and a half. These are small figures in the vast total of English trade. But commercial distress is ordinarily caused by the vicissitudes of business, the consequences of Free-trade here and Protection elsewhere, the imprudence of speculators, or the short-sighted exigencies of workmen. At Bristol the cause of distress is quite exceptional. It is an illustration of the effects produced by a single cause the operation of which is not often traceable in so conspicuous a manner. Messrs. FINZEL have been ruined by bounties, and by bounties alone.

In old days it was universally thought to be a legitimate and clever stroke of business for a Government to encourage special industries by favouring them with a bounty. We, for example, had once our bounties on the exportation of corn and our bounties on the exportation of linen. Bounties, too, are often given indirectly in the shape of drawbacks; and it may be remarked that, at the very period when the founder of the house which has

now failed was establishing his business, he and those engaged in the same trade had the advantage of an indirect bounty; for the drawback on exported sugar when refined was much larger than the duty on the raw material, and the excess was simply a contribution from the English nation to the sugar-refiners. In France the beetroot-sugar trade was avowedly nursed into existence and gradual prosperity by NAPOLEON and his successors, in order that France might not be dependent on foreign supplies during a war with England; and the sugar business has ever since been petted and fondled by French legislators, and the French nation has, for purposes partly political, been called on to save it from the trial of having to rest on its own merits. But the more the subject of bounties is considered, the harder it is seen to be to distinguish their effects from those of other forms of Protection. By paying bounties to its sugar-refiners France makes a present, not only to them, but to the English public, which gets refined sugar cheaper than it otherwise would get it. Messrs. FINZEL have been ruined because they have been undersold; and since they have been undersold the consumer must have had the benefit of the competition. France has lost so far as she has made this present to the foreign purchaser, and so far as all Protection must make a country lose; but from the English point of view there has been a gain to us, except that in a very circuitous manner every country suffers by any other country adopting a vicious financial system. One of the commonplaces of Free-trade doctrine is that we are to think of our consumers and not of our producers. Messrs. FINZEL are ruined, but English families sweeten their tea at a lower cost. It is true that when the bounties have killed off English competitors, foreigners may take advantage of the absence of competition to raise their prices, and so it might be thought that in the long run sugar would be dearer here. But Free-trade always works in this way. If the United States threw open their iron market, English competition might not improbably kill, or at least seriously hamper, the competition of American producers, and then English ironmasters might raise their prices. It may be said that the competition among these ironmasters themselves would prevent this. But in the same way it may be said that the competition among sugar-refiners would tell, and the French are not alone in the field, but have Belgian and Dutch rivals. The countries, too, which give bounties may be supposed to have some glimmerings of common sense left; and as the refiners can, with the present low prices, coupled with the bounties, do very well, it is obvious that, if the prices were raised, they could thrive with smaller bounties, and so the bounties would be reduced. But, as it is the bounties that prevent English competition, the foreign refiners, in order that this competition may not recur, have every reason to prefer large bounties and low prices to small bounties and high prices; and their natural aim would be to keep down the price of sugar in England low enough to justify their claim to as large a bounty as they now enjoy.

The silk industry of Coventry has sent this week a deputation to Lord DERRY to explain how dreadful are the sufferings and how great the losses which that industry has had and still has to endure in consequence of French competition. There was only one answer for Lord DERRY as a Free-trader to make. It is the principle of our recent legislation to think of the consumer very much and of the producer not at all. Coventry suffers, but Englishwomen purchase that strangely flabby and greasy material which now passes by the name of silk at a much lower price than they used to do. Lord DERRY asked the deputation if any reason could be given why English manufacturers were beaten on their own ground by French manufacturers; and he ventured to suggest that some deficiency in taste or skill might be the true cause. But the members of the deputation would not listen to this for a moment, and urged, with an impassioned confidence which showed how thoroughly their own case had impressed them, that in point of artistic design and finish English silks left nothing to be desired. They were inclined to attribute their disasters to the advantage the French have in being allowed to make their workpeople labour for more hours in the week than is permitted in England. This, as Lord DERRY replied, assumed that to work people for as many hours as competition will induce them to work is an advantage to a nation, whereas it is precisely the contrary assumption that has guided recent English legislation. The

remedy that the Coventry manufacturers really desire, and which would alone be efficacious in their eyes—the re-imposition of protective duties—is out of the question. Lord DEXTER simply asked the deputation to consider how hopeless it would be to invite Parliament to reintroduce protection when it has been abandoned. The case of producers like Messrs. FINZEL, who suffer not from the competition of rival producers, but from bounties, seems harder than that of the Coventry silk manufacturers; not that the misery produced is greater or of a different kind, but because the Coventry employers have been beaten in a fight between producers as to which set could most benefit or please consumers; whereas the English refiners have been beaten, not in a fight between producers simply, but between one set of producers helped by the resources of a nation and another set not helped by the resources of a nation. There seems something specially hard and unfair in such a contest being forced on any class of producers, and many persons think that in such a case retaliatory duties are justifiable. This, for example, is the opinion lately expressed by Prince BISMARCK, who said that in a general way he was all for Free-trade, but that he must insist on duties being imposed on articles coming from France on which a bounty was given. Great allowance must, however, be made for an English Minister who declines to follow Prince BISMARCK in this matter; for to impose retaliatory duties is to raise the price to the consumer for the benefit of one class of producers. It is not surprising, therefore, that Lord DEXTER looks in another direction for a remedy, and has been concentrating his efforts on the conclusion of a convention with the countries now giving a bounty on sugar, by which they would recognize that bounties injure the country that gives them; and thus the English refiner would be saved, not by retaliation, but by the conversion of France and its neighbours to sound principles of finance. Unfortunately this conversion makes slow progress, and the negotiations for a new sugar convention have been unavoidably protracted; so that, if the remedy ever comes, it will have arrived too late to save Messrs. FINZEL from a disaster which they have in no way deserved to encounter.

AMERICA.

THERE seems to be little doubt that the President of the UNITED STATES adheres in his dealings with the South to the policy of compromise which he announced before his election. Even if he were not influenced by a regard to justice and constitutional right, his own political interest would supply a sufficient motive for conciliating the Southern Democrats. Both the Senate and the House are almost equally distributed between the contending parties; and in either branch of the Legislature malcontent Republicans might, by coalescing with the Democrats, form a majority hostile to the PRESIDENT. It was probably in the expectation that the Democrats would support a President from whom they hoped for equitable treatment that the Republican managers in the Senate assented to Cabinet nominations which must have been highly distasteful to themselves. Mr. HAYES cannot fail to understand that a consistent pursuance of the same policy will tend to secure his independence. Before he can commence the reform of the Civil Service to which he is pledged, he must cripple factions opposition both in the Senate and the House. It is not to be supposed that the Republicans in either branch will surrender without a struggle the patronage which they appropriated to themselves during the Presidency of General GRANT. The strength of parties cannot be satisfactorily tested until it is known whether the PRESIDENT can rely on the support of the Southern States. The partisans whom he has already slighted may perhaps hope that concessions to the Southern Democrats may tend to revive the obsolete agitation in favour of the negroes. Notwithstanding the forcible reasons which recommend the abandonment of Federal interference in the disputes of the Southern States, Republican politicians hoped that the PRESIDENT would be embarrassed by personal considerations. The voters who are supposed to have elected Republican Governors in Louisiana and South Carolina are the same who chose the Presidential electors by whom Mr. HAYES was preferred to his competitor. If the elections in the two States were fraudulent, it might be plausibly contended that Mr. HAYES ought to share the disqualification

of Mr. PACKARD and Mr. CHAMBERLAIN. As is usual in American elections, the names of all the Federal and State candidates were placed on the same ticket; and there was probably little difference in the number of votes which were respectively recorded in their favour. When the Tribunal or Joint Committee of Congress resolved to accept without question the disputed returns in favour of Mr. HAYES, the Republican candidates for State offices probably believed that their own return had been made secure.

An admission that the Democratic candidates were returned by a majority would not be technically inconsistent with the decision of the Joint Committee. It was determined, though unfortunately by a party vote, that Congress and a body appointed by Congress had no power to inquire into the validity of a State return. Although it was not a little surprising that the Republicans should become zealous advocates of State rights, the judgment of the Tribunal may probably have been consistent with the letter and spirit of the Constitution. The existence of a wrong is no proof that a special remedy can be legally applied. If the Federal Legislature could not in any case interfere in the choice of Presidential electors, no extravagance of fraud could give it a power not conferred by the Constitution. The question whether one of two rival candidates has been lawfully elected Governor of a State may perhaps be determined by other considerations. In practice General GRANT supported by military force the Governments and Legislatures which were returned by his own party. The interference of the Federal army in State elections has long been regarded as an abuse, and the report that Mr. HAYES has ordered the evacuation of the State House of New Orleans will probably be confirmed. It is difficult to ascertain how the legal title to Executive or Federal office is to be determined after the withdrawal of the Federal authorities; but it is generally understood that the great preponderance of moral and physical force will enable the Democrats to obtain possession of the Government. No framer of a Federal or State Constitution provided against the possibility of a disputed election. Every Assembly, as a rule, exercises the right of recognizing or rejecting the credentials of those who claim to be members of the body; but it would have been difficult to provide for the case which has now actually occurred of conflicts in more than one State between two Legislatures and two would-be Governors. The decision will, after all, rest with the Federal Government. The President is required by the Constitution to supply on the demand of a State Government any force which may be necessary for the maintenance of law and order. He is therefore compelled in cases of dispute to satisfy himself of the title of the functionary who applies for aid; and, if General GRANT had not been ostentatiously influenced by party motives, his armed support of Republican Governments in the Southern States would have been less severely blamed. In the present case the PRESIDENT may perhaps evade a direct decision, though the result of the contest will depend on the course which he may adopt. The Democratic candidates for the office of Governor in Louisiana and South Carolina have no need to ask for the aid of the Federal army. If they are only left to themselves, they will have no difficulty in establishing their authority, though the public peace may perhaps in the first instance be seriously endangered. When Democratic Governments are once in possession of power, there will be no reason to apprehend the future disturbance of a stable equilibrium. The Returning Boards will be appointed by the dominant party, and they will have comparatively little temptation to resort to fraud. In all but two of the Southern States the superior race has already reclaimed its supremacy.

The Special Commission which has been despatched to New Orleans has probably been appointed for the purpose of recommending to the PRESIDENT a policy on which he has already determined. In the United States, the choice of a representative or agent is generally equivalent to the adoption of a certain course of action. In the late Joint Committee, every member, including the Judges of the Supreme Court, voted rigidly with his party, although his duties were strictly judicial. The reception of the Commission at New Orleans proves that the Democrats are satisfied with its composition, and that they have therefore a just reliance on its decision. It must by this time be necessary to terminate the existing ambiguity on every local question of administration or expenditure. There has for several weeks been a conflict of authority; and the

taxpayers have been unable to provide the necessary revenue, because they have not been certain whether the Democrats or the Republicans could give a valid receipt. American anomalies, even in the South, are more innocuous than similar complications in other countries; but for some time past there has been a risk of civil commotion, both in New Orleans and in Charleston. Fortunately, the Democrats, though they may despise their local adversaries, have had the good sense to respect the Federal flag. In all probability they will be rewarded for their moderation by obtaining possession of the Government. Mr. WADE HAMPTON is said to have been, during his late visit to Washington perfectly satisfied with the language and demeanour of the PRESIDENT, who is not likely to have excited hopes for the purpose of disappointing them. While the PRESIDENT is bent on reconciling the Southern States to the Union, he has judiciously taken an opportunity of showing his determination to maintain the political equality of the coloured race. The appointment of Mr. FREDERICK DOUGLASS, who was once a slave, to the honourable office of Marshal for the district of Columbia seems to have been received with general approbation. One of the Southern Democratic Senators supported the nomination; and those who opposed the appointment were careful to found their objections on the alleged unfitness of the candidate. The duties of a Marshal in Washington are probably not beyond the capacity of a negro who has given many proofs of intelligence and energy; and even if an obscure branch of the public service suffers for a time in efficiency, it was well worth while to satisfy the philanthropic section of the Republicans that the claims of coloured citizens would not be overlooked. It is more for the interest of the negroes that some of their number should be admitted into the lower ranks of the official hierarchy than that they should displace the superior race by obtaining the control of State Legislatures and Governments. The Southern Americans of European descent have no habitual ill-will to the emancipated slaves. It is only when they are expected to submit to the dominion of their inferiors that they naturally resent a state of things which is not the less an abuse because it is authorized by a modern amendment of the Constitution. There is reason to hope that long before Mr. HAYES has completed his term of office the relations between Southern whites and negroes may be peaceably and equitably settled.

THE ELECTION AT BORDEAUX.

THE moderate Republicans at Bordeaux have not justified the hopes entertained of them. The unusual step was taken of bringing forward a new candidate at the second ballot, in order to give them an opportunity of showing at the last moment their detestation of extreme views; but, so far as can be inferred from their action, they dislike moderate views—at least moderate views of the colour presented to them by M. CADUC—quite as much as they dislike extreme views. Nearly half the electors did not vote at all, and the consequence was that the Irreconcilable candidate was returned. This is a defeat, both for M. SIMON and for M. GAMBETTA. It is a defeat for M. SIMON, inasmuch as it shows that the profession of a general agreement with the Republican Government is no longer a passport to the confidence of moderate Republicans. It is difficult to believe that under the late Administration the same result would have followed. To begin with, the complexion of the candidate chosen would probably have been different. M. SIMON's Cabinet represents so small a section of French opinion that it is forced to make alliances somewhere. Though there is supposed to be no love lost between M. SIMON and M. GAMBETTA, M. GAMBETTA's followers are more inclined than any one else to keep M. SIMON in power, and it is to them therefore that the Government naturally look for aid. Consequently the candidate most naturally picked out at Bordeaux was an Opportunist candidate. It was supposed that he would command the votes of M. GAMBETTA's friends because he held their particular views, and the votes of M. SIMON's friends because he was ready to give a general support to the Government. The polling showed how large a section of the electors are friends neither of M. GAMBETTA nor of M. SIMON. The Conservative Republicans at Bordeaux do not seem to make any difference between the several varieties of Radicalism. They have

not confidence enough in the present Government to think it worth supporting even against such a Government as M. MIA would like to provide them with. This is the result of a too rapid progress in the direction of what are called Republican ideas. The Republicans in the Chamber of Deputies are very far ahead of the Republicans in the country, and the votes which they gave against M. DUBAURE represented their own views, not those of the party out of doors. There are no more timid politicians than French moderates of any party, and the moderate Republicans seem likely to prove this by yielding themselves up to a blind terror of M. SIMON because he has been a Republican all his life. Their test of a working Republic is that it shall admit of being worked by men who are not themselves Republicans. One of the secrets of M. THIERS's popularity was the knowledge that he was not prevented by any principle from proclaiming a restoration. He threw in his lot with the Republic because he had convinced himself that the Republic was the system which there was the best chance of establishing on a really permanent footing. When, after the Royalist interregnum was over, M. DUBAURE took office under Marshal MACMAHON, he was supposed to carry on M. THIERS's theory. He would have liked a constitutional Monarchy better than a constitutional Republic; but, as the former was out of his reach, he took the best imitation of it that he could get. The moderate Republicans, who had mostly accepted the new order of things on the same half-and-half terms, saw in this feeling a guarantee that the Government would not be carried into extremes. A statesman who accepts an institution because he cannot help himself is not likely to take any more of it than he is obliged. When M. DUBAURE was succeeded by M. SIMON, this particular guarantee was no longer forthcoming. M. SIMON was a Republican on principle and by conviction, and principles and convictions are things which the moderate Frenchmen holds, not quite without reason, in the most holy horror. His moderation is absolute, not relative. It does not lend him to support a less extreme Government against a more extreme. If he is not satisfied that either of them will give him exactly what he wants, he loses heart and ends by supporting neither. One is as bad, he thinks, as the other, and, why should he trouble himself to choose between the two?

When the Republicans in the Chamber of Deputies decided to overturn M. DUBAURE's Ministry because he was not sufficiently Republican, they did not take this "wrong" of their countrymen into account. The very trusted, which made M. DUBAURE distasteful to them were the blunders that gained him confidence out of doors. The moderate politicians thought they had a Mission as a watch-dog fighting for the Republic as administered by the moderate Frenchmen. Of course, if the genuine Republic had been open to the same criticism, the conduct of the Republicans in the Chamber would have been justifiable. Of all the worst is a Government which is secret because he the institution it professes to protect. But the adversaries did not pretend that this was an opinion as to the had no suspicion that he was intriguing. The form of Monarchy for the Republic. When the following his version of the Republic was not Tuesday:— would prefer seeing their own version, had been version. This was a perfectly natural passage the same ference taken in itself; but those who made the mistake of not calculating the number of votes, while the vessel tained it. They had seen clearly how necessary it was to correct the defect in the Frenchmen which had not been repaired at Valparaiso. such, and only tolerated it because they believed that it would give them what they wanted. But they failed. MR. RUSKIN. because it was so unlike other bodies of Frenchmen had formed. All dates the frankness of his substitute M. SIMON for M. CADUC. In that class of literature that M. SIMON would make his bid and the ages with his wit was to risk alienating the friends of the Republic. The Bordeaux election danger is really serious, in printing his little book, which indeed is throughout France show reserve with care. For some months vote at the next general election. These authors of private interest of abstentionists of Bordeaux. The result of the election to practical people who will be much larger irreconcilable. In the March number of the St. Francis magazine some of his most intelligent readers said

to the sectional minorities of the Legitimists and the Imperialists, the Republican Government may be placed in a very embarrassing position. It will have to make large concessions to one or other of its opponents in order to buy their aid against the remainder, and in whatever direction these concessions are made they will be equally damaging to the Republic. To attempt to conciliate the Extreme Left will enable the Monarchists to present themselves as the saviours of society. To attempt to conciliate either the Imperialists or the Legitimists will convince the Republican party that it is being betrayed, and that a Government which can so act does not deserve to be upheld.

The Bordeaux election has also its special lesson for M. GAMBETTA. He is responsible more than any one else for M. DUBAURE's overthrow, and he must apparently take the blame of having been over-sanguine in his estimate of his own strength in the country. So long as a Republican of the type of M. DUBAURE was at the head of affairs there were probably many of the less violent Irreconcilables who thought it wiser to support M. GAMBETTA's candidates at elections as having the best chance of success against the Government candidates. Now that M. DUBAURE has been succeeded by a Minister whose republicanism is regarded as of much the same character as M. GAMBETTA's, this consideration ceases to operate. A decided step in advance has been taken, and the Opposition must not lag behind. Naturally enough, therefore, the Irreconcilables, who voted for M. GAMBETTA's candidates, not because they really trusted them, but because to vote for them offered the readiest means of annoying the Government, have no longer any reason for taking this course. To fill the Chamber with Opportunists would now be to strengthen the Government, whereas their sole motive for voting for Opportunists was that they hoped their return would weaken the Government. Consequently they now vote for men of their own views. Thus for the first time the strength of the Irreconcilable section of the too late republicans is to be measured against the strength of the have opportunist section. It is plain that the longer the trial is postponed the better would be the chances of the Opportunists, and it is a serious blot on M. GAMBETTA's ego that he should have helped to precipitate it.

THERE THE GAS AND WATER LEGISLATION.

South to the House of Commons lately occupied successive before his of the same sitting in debates on the practical political interest of gas and water. The Chairman of Committees conciliating the Gas Companies by giving notice of a and the House a Order to the effect that new capital should be contending particular or auction, or, in other words, at the malcontent Rep without profit to the shareholders. The Democrats, form amused by the statement of a professional was probably in th he had not received his instructions in support a President, but most of those who took part in the treatment that the apparently not received instructions even at assented to Cabinet t. A formal objection to the proposed highly distasteful to and a precedent which was quoted in to understand that a posal, were equally irrelevant. Mr. policy will tend to securi of the alleged violation of an Act by enunciation the reform of that, in default of special provision, pledged, he must cripple distributed at par among the share-Senate and the House. It SPEAKER afterwards explained, the Republicans in either bra have no effect until it was inserted struggle the patronage whicent. The general or model Acts selves during the President, incorporated in private Acts only define strength of parties cannot be be observed in default of special is known whether the PRESIDING Order would only control of the Southern States. Trustees by rendering general a already slighted may perhaps hdy been prescribed by several Southern Democrats may ten hand, some of the provisions citation in favour of the negts of 1876 greatly alter the he forcible reasons, which recon, which they contain. By a of Federal interference in the dis the previous year, the Com-Senate, Republican politicians hoped their rate of dividend in would be embarrassed by personal cion of the price of gas, voters who are supposed to have gne, and therefore in the Governors in Louisiana and South, the dividend or interest, same who chose the Presidential election Companies, though Harris was preferred to his competitor. Offtable allotments, will the two States were fraudulent, it might ally when new capital headed that Mr. Harris ought to share the Provincial Com-14 their under M. a customary benefit

It would be but fair to offer to any Company, which may be subjected to an auction clause the choice of accepting a sliding scale.

Of several hundred existing Gas Companies, the great majority in number, though not in magnitude, are established under the Joint Stock Companies Act, without Parliamentary powers or restrictions. The gas shareholders regulate their charges with reference either to their own interests as dealers or to the patience of their customers. They depend on the good will of the local authorities for permission to break up the streets, and they take their chance of opposition from the owners of the soil. As population and consumption increase, the larger Companies find it ultimately convenient or necessary to obtain a Parliamentary constitution, involving limitation on profits and other statutory conditions. It has been usual to authorize the creation of new capital bearing a dividend of 7 per cent. and commanding a premium of from 2 to 3 per cent.; but of late years corporate bodies have often opposed a concession which is made at the cost of the consumers. The question will probably be settled in all large towns by the purchase of the property of the Gas Companies. Corporations can well afford to pay the market price of the shares, with a certain percentage as a bonus; and it is convenient that the real owners of any kind of property should control its administration. When a Company has reached its maximum dividend, the surplus of profit legally belongs to the consumers, who are entitled to a reduction of price. The sliding scale has given some of the London Companies an interest in economical management; but municipal ownership affords a simpler and more satisfactory arrangement. Although the production of gas for sale is ostensibly a commercial undertaking, it practically assumes the character of a monopoly; and it scarcely involves a risk of loss. If members of the House of Commons should at any future time seriously study the subject, the transfer of the gas supply to municipal authorities may be accomplished without difficulty. The Corporations generally divide the profits of the undertaking between the consumers and the Borough Fund, which is applicable to purposes of local improvement. No instance is known of a return to the joint-stock system.

Debates on water supply abound in well-founded complaints, but partially interspersed with practical suggestions of improvement. Mr. Brown expatiated with much good sense on the disadvantages of polluted water, especially where it is supplied to dairy farms, to the great detriment of purchasers of milk. Detached houses, villages, and towns which derive water from shallow wells are exposed to great inconvenience and frequent danger. As a general rule, rivers, except in the close vicinity of sources of pollution, provide wholesome water. The oxidation of noxious substances removes all ordinary causes of risk, although it may afford no security against certain specific germs of disease. London water from the Thames and the New River, although it is not actually pure, is generally wholesome. The water drawn from the chalk by the Kent Company is equally wholesome, and at the same time it is perfectly pure. As a general rule, it may be said that river water, though it may be tasteless, turbid, and perhaps repugnant to the imagination, has no tendency to propagate disease. Wells and springs not effectually secured against surface contamination ought always to be regarded with suspicion. The water which is collected from mountain gathering grounds is the best which can be obtained; but, from the nature of the case, it cannot be provided except at the expense of large urban communities. Villages which are fortunate enough to find themselves in the neighbourhood of mains laid down for the supply of large towns are by modern legislation entitled to share in the benefit. Deep wells sunk in chalk or sandstone supply excellent water, and they involve no outlay for compensation; but the works and the machinery of supply are too costly for small communities. In some formations there is no natural storage of water; and in mineral districts ancient springs are often suddenly destroyed by subterranean operations; but in all parts of England a large population may be supplied with good water at a certain expense. A proposal made in the course of the debate that mine-owners should be liable to make good the damage resulting from the overflow of water would involve both an extension from the general law and much practical difficulty.

Mr. Stansfeld seems to be much sanguine in his view of the improvement of rural districts. Villages which

belong to single proprietors who are at the same time rich and liberal have a chance of a sufficient water supply. Boards of Guardians, which are the rural sanitary authorities, have little disposition to raise large sums for the benefit of the villages within their jurisdiction. Such a water supply as owners and occupiers might be able to pay would in the majority of cases be inadequate to pay interest on the necessary expenditure of capital; and the ratepayers throughout the Union would grudge a contribution made for the exclusive benefit of a single spot. It is barely possible that County Boards, when they are once constituted, may have strength enough to administer the sanitary functions for which Boards of Guardians are incompetent. In some cases water might be supplied to a village at a moderate cost; but the rural authority and its officers are not accustomed to interfere with local arrangements. Even under the best administrative and legislative system, it will be impossible to undertake costly schemes of supply for a poor and scanty population; but direct and dangerous contamination might always be prevented at a moderate expense. In Parliamentary debates it is generally assumed that want of water can only be caused by gross negligence. Storage is, however, often a costly undertaking, and streams can seldom be brought to villages from a distance. Although the Lords' Committee on the Pollution of Rivers may perhaps collect useful information, its inquiries will throw little light on the condition of villages, cottages, and farms. It is desirable that from time to time attention should be called to the important subject of water supply; but hitherto little advantage has been derived from Parliamentary discussion.

WHAT THE NAVY IS COMING TO.

AT a Conservative dinner at Peterborough the other day one of the speakers, in proposing the Navy, remarked that "during the dull season of the year they were sometimes told that the navy was very badly managed, and that there were gentlemen of great industry and talent who had to a great extent the ear of the public who were fond of propagating these theories." Unfortunately, however, the proofs of naval mismanagement are not theories but facts, and are not confined to the dull season, but are steadily kept up all the year. Take, for instance, the letter from a correspondent on board H.M.S. *Tonnant* at Simon's Bay, on the West Coast of Africa, which was published in the *Times* of last Saturday, and gives an account of the condition of that vessel. The writer begins by stating that before leaving Sheerness she had a hot bearing at the trial trip, and the dockyard people put in a little white metal where it had run, and she then started for Portsmouth. She had, however, to anchor off Deal, "partly through bad weather, and partly" though this was perhaps the chief reason—"because the bearing again got hot." And it is added, "Even now"—that is, after arriving at the West African station—"it is impossible to keep it thoroughly cool." Moreover, "the receiving tank, the only place whence water could be got to feed the boilers, except from the donkey, burst, so that we were compelled to use salt water." After leaving Portsmouth there was very bad weather; and "the result was that the water could not be kept in the boilers, and the engines stopped all at once in consequence of the priming." When the steamer was started again "she made only a few revolutions, when bang went the trunk on the after cylinder." The spare one had then to be shipped while the vessel was rolling to such an extent that the crew could hardly keep their feet. The job was finished by 8 o'clock in the morning; but "the vacuum went down to seventeen, where it remained in spite of all our efforts." When the condenser doors were taken off it was found that "seven or eight hundred tons had been driven right out to the doors, and more than a thousand an inch out"; and it cost the engineers "five days, watch and watch," to put the worst of them right. It is further stated that the low-pressure engine had never done its work at all, the high-pressure engine having done all the duty coming out, and during this time six, seven, and occasionally even nine pounds of coal for indicated horse power were being burnt. Then, again, "the eccentricity of the valves is only 22 in. long by 3 in. broad, and have to drive such heavy valves—the low-pressure valves weigh 16 cwt.—that it wears away the stems, which are 3 in. thick, in about 24 hours steaming."

and, "we have had," says the writer, "to put in six spare ones, four of which were made out of boiler tubes; and there was very little of them left when we got in here." There was also "a difficulty with the piston," which had had new springs put in, but they would not work. And, as if all this were not enough, we are told:—"Besides other defects, which it is not worth while saying anything about, the propeller has been a great source of anxiety to us all. We have been four hours in endeavouring to get it up; and, as to lowering it, we could never depend upon its going down without having to move the engines backwards and forwards about a dozen times." The shaft, it seems, always worked forward, and they had to bring it back every time they got under way, as it interfered with the propeller; and, the propeller itself having its T-head too long, stuck every time it was raised or lowered, and when the ship had a list to either side, could not be got down at all.

After having got so far in his recital of difficulties and breakdowns, the correspondent says:—"Such a ship was never before sent to sea in such a state," which we should be glad to think true. And he goes on to explain that "there is a separate engine and a helical pump on board, and as the upright spindle had never been packed, and the bush had only a plain pin halfway in the casting and half in the bush, and as it, moreover, turned round with the spindle, there were no means of lubricating it, and the noise it made was terrible. The only way in which we could stop it was by opening the exhaust into the condensers, and the oil used to go up to it in that fashion; but, on account of the tubes leaking, the water got back into the helical engine and nearly stopped it, and of course destroyed the vacuum." The result was that most of the machinery had to be sent on shore for repairs. New lines had to be put on the bottom of the guide blocks, as they were worn a quarter of an inch, and the piston-rod glands would not go on, and, on taking off the cylinder-covers to turn up the piston, the support was found to be cracked, and a spare one had to be substituted. And then the writer winds up:—"You will have heard that our chief engineer cut his throat on the 27th of January, and died on the 2nd of February, the noise of the eccentricities disturbed his rest and he often thought that something was going wrong."

It appears from this statement, if it is to be trusted, that almost every conceivable form of engineering blunder and neglect was combined in the mechanical arrangements of the *Tonnant*, and there ought certainly to be a searching inquiry into the facts of the case. A letter from the firm which supplied the machinery has appeared, casting doubt on the statements of the correspondent of the *Times*; but the question is of course not as to the original fitting of the vessel, but rather as to the conduct of the dockyard authorities in allowing her to be sent out in the state alleged. The poor engineer who committed suicide because he "often thought that something was going wrong" expressed what is now a very wide-spread opinion as to the general condition of the navy. As an additional proof of this, if any were wanting, may be taken the following paragraph from the *Daily News* of Wednesday:—

"The *Opal*, 1,864 tons, 2,100-horse power, had been ordered up to Iquique. During the passage she ran all-luck which has attended the *Opal* since she left England again held her, the engines, while the vessel was steaming at nine knots per hour, again breaking down, on this occasion from a defect in the eccentric rod, which had previously been repaired at Valparaiso."

THE CONFESSIONS OF MR. RUSKIN.

MR. RUSKIN'S confessions still do not do the frankness of his most outspoken predecessors in that class of literature. Montaigne told the world and the ages that he liked white wine, but he did not present the world and the ages with his own merchant's account. Mr. Ruskin confesses himself in Venice, and Rousseau amused himself in the same city; but Rousseau was prudent enough to abstain from printing his lullaby, which indeed it is probable that he did not preserve with care. For some months past Mr. Ruskin has published these matters of private interest at the end of *Mors Clavigera*, rightly judging that exactness is required even in details which are generally veiled in a Turnegian mystery by writers of autobiographies. The April number of *Fort* has dealt a painful blow to practical people who prize themselves on their common sense. In the March number Mr. Ruskin had made some startling references to "St. Francis' manner," which he finds that "some of his most intelligent readers" had

make nothing of." Without pretending to be among Mr. Ruskin's most intelligent readers, we had a satisfactory theory of our own, based on a remark of Charles Lamb on Coleridge's theosophy. "Don't mind Coleridge; it's only his fun," said Lamb; and we rested in the belief that St. Ursula's messages were only Mr. Ruskin's fun. One of "the pieces of private mes-age" which reached him bade him forgive a debt owed by a relation, as he tells us frankly in his statement of "the affairs of the Master." These affairs shock and perplex intelligent readers even more than the message of St. Ursula did. Intelligent readers, to tell the truth, never can understand persons who have the audacity to differ from them.

It is not easy to understand whether the general amazement caused by the affairs of the Master is surprise at Mr. Ruskin's way of managing his property, or astonishment at his choosing to tell the world about his own expenditure, or a combination of both these. The confessor admits that he expects to make but a poor figure in the eyes of practical people. If his present position in the world were altogether stately, he says, "it might have been pleasant to unveil the statue of one's economy for public applause." The poor statue is rather in the mutilated condition of some famous works of ancient art, and in the Master's present property we recognize only a beautiful fragment of a once handsome figure of 157,000*l.* It is not of ostentation, as Mr. Ruskin says, that his readers will accuse him. He began life, or perhaps it would be more fair to say began living as he understands it, with the sum already mentioned, and certain houses and lands besides, as well as a large collection of valuable pictures. After living on his capital for thirteen years, at the carefully restricted rate of 5,500*l.* per annum, and after making generous gifts to public institutions and private persons, he still retains a little property of fifty-four thousand pounds. Long ago Mr. Ruskin proposed to himself to die as poor as possible, which was the aim also of Henri Murger, and an aim which he succeeded in accomplishing. Both men of genius preferred to make the most of what they had while they lived, though their notions of making the most of their money differed in essential points. Mr. Ruskin is really, though perhaps he is not conscious of it, a philanthropic and æsthetic, though most respectable, Bohemian, and his ideas about money are those of many men of letters who unfortunately have no means wherewith to practise their philosophy. He has always preferred the actual employment of his wealth to what fascinates the majority of men, the sense of reserved power. He has added to this disposition a few economical actions which have a picturesque charm, though their æsthetic beauty is unlikely to secure their survival. Thus the general interest in the Master's affairs cannot be accounted for by saying that there is anything new or unheard of in the Master's views of property and expenditure. What is new is that the Master has enjoyed the chance of doing on a grand scale what poor men and luckless often do on a small scale. Mr. Tennyson speaks in *Tithonus* of a boon conferred "as rich men give that care not for their gifts." It is a commonplace remark that poor men of a certain temper are far more lavish than rich men. Mr. Ruskin combines the temper of the penniless artist with the possession of considerable wealth, and his generosity has been based on a true and keenly felt sense of the needs of large classes of men. But he might have been generous without printing a statement of the exact mode in which he "muddled away," as the churchwarden put it in his statement of parish expenditure, 157,000*l.*

The freedom of Mr. Ruskin's confession is not without that little touch of malice which always prevents his *naiveté* from degenerating into *maiserie*, which keeps his simplicity from being silly. "See," he cries, "how my money went when I played the practical part, and behaved like other people. And look how my money went when I pleased myself, my conscience, my relations, and acted in opposition to the laws of Adam Smith and of worldly wisdom." He admits that, "when one is living on one's capital, the melting away is always faster than one expects," which is a truth of experience that a man may discover without possessing Mr. Ruskin's keen eye for the movements of glaciers. The melting away must be allowed for beforehand by economists who think that to take interest is to commit a crime against nature by encouraging the breeding of barren metal. Mr. Ruskin's first performance on the sensible tack, and by way of giving ordinary ideas a fair chance, was to invest 50,000*l.* in "entirely safe" mortgages, from which he may have contracted his affection for the word "entirely." He lost about 20,000*l.* on them altogether, and had not even, in sporting phraseology, a "run for his money." There is no pleasure or happiness to be got out of the dead loss of 20,000*l.* in an ordinary, or perhaps extraordinary, business transaction. But Mr. Ruskin is aware that, if he had been even as other men, his conscience would have said "well done" when he muddled away his money in a strictly conventional fashion on an investment which was entirely safe. His next exploit was to buy pictures, and here he showed some of the wisdom of the serpent. He can easily "bull" his own pictures and "bear" those of his neighbours if he pleases, and were he an unscrupulous and skillful trader, he might write a new volume of *Modern Printers*, send some unheard of early Italian master up in the quotations, and then throw a few specimens on the market with satisfactory results. But Aristotle has well observed that, though the philosopher knows these dodges, he does not practise them, for his heart is set on other things. Mr. Ruskin, within his character of man of business, now scored what he calls "a satisfactory legal performance." He bought five hun-

dred pounds' worth of minerals for three thousand pounds, and "went to law about it." The lawyers cross-examined him for years as to whether the agreement was made in the front or back shop, and they charged him one thousand pounds for their services. They also got him back one thousand pounds out of the three, and made the owner of the back shop render up to him another assortment of minerals worth five hundred pounds. Though he muddled away a good deal of money in this affair, Mr. Ruskin had no joy of it, and determined to be himself, and make ducks and drakes for the future on æsthetic and philanthropic, not on conventional, principles. He had already given his relations 17,000*l.*, whereby he "indulged himself and relieved his conscience," and had, as the moral follows, much more happiness for his money than if he had lent it to the Grand Turk or the prince of the power of Egypt. Fifteen thousand pounds were "lost" to another relation, and this transaction was scarcely so agreeable, though of course it is much better to mention it in *Fora*, and then think no more about it. A trifle of 14,000*l.* went in presents to Oxford and to Sheffield. It is to be presumed that Mr. Ruskin has got more happiness out of the many hours of the highest pleasure which he has given to workmen and University men than out of the most successful legal performance in which he could have expended his money. The sums laid out on Brantwood and pictures are sagacious investments, and Mr. Ruskin has still the worth of some fifty or sixty thousand pounds. But he has been so much encouraged by his success when he took his own way and had, if the expression may be used, his fling, and so much depressed by ill fortune and conscientious scruples when he walked in the broad path that leads to the Bank of England, that he is set on taking to mate a comely poverty. He has seen Giotto's fresco of the marriage of St. Francis, which few people have been privileged to look on closely, and he describes the mode in which he means to woo the same bride. His Marylebone property (3,500*l.*) is to be made over to St. George's Company, under Miss Hill's superintendence. Brantwood he will keep, as a hermit's cell; of his ready money, 3,000*l.* will pay for one year's pleasure in "poking about in search of the picturesque"; the remainder will yield 360*l.* a year, and his literary gains will keep up his charities. More Turner drawings are not for this anchorite; but, as he already possesses thirty large and fifty small ones, he may "get through the declining years of his artistic life resignedly." There are still to be cakes and ale, as far as an occasional new missal goes. In short, Mr. Ruskin's poverty is to be of a more smiling aspect, more well-liking, more given to strawberries and cream, than the bride of the Saint of Assisi.

Mr. Ruskin, as painted by himself, is a person who has his satisfaction in the most gracious sort of good deeds, and in most of the higher pleasures. He cannot know himself when he writes, "My own complete satisfaction would have been in buying every Turner drawing I could afford, and passing quiet days at Brantwood between my garden and my gallery, praised, as I should have been, by all the world for doing good to myself." The author of *Fora Clavigera* would never have had a moment of satisfaction while other people were without Turner drawings, and without the power of enjoying them which he has first created, and then satisfied. In his gallery and in his garden, the faces of children who never breathe fresh air or see flowers would have haunted him. His confessions are chiefly strange from the very fact that he chooses to make them, and does not leave them to be guessed at. Why should Mr. Ruskin be his own "interviewer," and anticipate the curiosity of the Americanized portion of the press? It is his own affair if he does not see that he could have done more good to others and himself by spending the interest of his 150,000*l.*, and retaining the capital to be a perpetual *fons leporum*. If he thinks that this plan would have been a Jesuitical doing of evil that good may come, it is too late in the day to argue with him. We might as well try to persuade him that he is wrong when he says that the entire teaching of Mazzini "was rendered poisonous to Italy because he set himself against kinthood." One cannot poison what does not exist, and it would be hard to show how Italy could have come to exist without the teaching of Mazzini. "The stronghold of Protestant heresy," says Mr. Ruskin, "is pure pig-headedness," and he himself sometimes retreats into this Englishman's castle.

THE LAKES IN SPRING.

IN the Miscellaneous Observations which enliven Wordsworth's too little read Description of the Lakes, the poet tries in true Wordsworth fashion to make up his own mind and his reader's on the question, When are the Lakes best seen? "It is almost exclusively from June to August," he says, "that strangers resort hither. But that season is by no means the best; the colouring of the mountains and woods, unless where they are diversified by rocks, is of too unvaried a green; and as a large portion of the valleys is allotted to hay-grass, some want of variety is found there also. A stronger objection is rainy weather setting in sometimes at this period with a vigour, and continuing with a perseverance, that may remind the disappointed and dejected traveller of those deluges of rain which fall among the Abyssinian mountains, for the annual supply of the Nile." This is a characteristic sentence, and one we should think which scarcely hits off correctly the average experience or impressions of the Manchester and Preston folk who crowd to the Lakes every summer, and who are not likely to be so familiarly acquainted with the Abyssinian rainfall as Wordsworth

supposes. But a sentence or two further on we get our poet on safer ground. In a few true and delicate touches we have put before us, first, the mountains of September, and secondly the mountains of May; the autumn hill-sides "glowing with fern of divers colours"; "the calm blue lakes and river pools," "the tender green of the after-grass upon the meadows," which greet the September wanderer; or again the spring copses "intervened with golden broom-flowers," the "wild and light motions" of the lambs, the haunting cuckoo-voice in the deep mountain valleys, which April and May have to offer. The late spring Wordsworth finally pronounces to be the best time for the Lakes, and there are few among the native or adopted children of Westmoreland who will not agree with him. Westmoreland in August, with its roads filled with worthy families strapped and knicker-bockered, its hotels, and innkeepers and guides seeming to make a traffic of the hills, and selling waterfalls for gold, its unkind and lowering skies, or its fits of unwelcome and depressing heat, is sometimes trying even to the most faithful of its devotees. To those who have a free autumn Wordsworth's advice to see the country in its dress of orange fern, when the crowd has passed by and the coming austerity of winter is beginning to dignify the high and low grounds alike, may well be recommended. But there are many people who never have had and never will have a free September. To all such we commend the Lakes in spring; and as few busy people, unless they have the felicity to belong to a Scotch University, are likely to be sight-seeing in May, we would say, go in April or even in March. There are few things more shyly, persuasively beautiful than a mountain country in the border-time between winter and spring.

The first view of the hills over Morecambe Bay awakens mixed feelings. In the far distance, over the "wide expanse of shining water," a line of ghostly peaks hangs in the haze; through the windows of the train a wind comes blowing, so keen that the traveller whose travels have led him at any time to the Eugadine feels a familiar shiver creeping over him, and is forthwith haunted by a perpetual memory of St. Moritz. He reminds himself severely that for enervated beings who want warmth the Riviera and not Westmoreland is the place to go to. What can be more bracing than this air, more ethereal than those snowy peaks? Nevertheless it is a fact that the first breath of the north wind blowing towards Kendal from the Pikes and Bowfell has to be met with resolution; and to the dweller in English midlands, used for the most part to consider snow peaks, like tigers, as things of foreign growth, the first sight of English hills robed in Alpine garb has a touch of inhospitable strangeness. But by and by, as the hills come nearer, the harshness wears off, while the novelty and magnificence remain, and as you drive along Windermere in the spring twilight with a darkening lake spread out before you, Wetherlam on the opposite side mysteriously high and white, a line of vivid gold on the purple water, and towards Ambleside a confusion of fells drawn in faint desolate tints against a sober sky, the southern Englishman to whom the scene is new is forced to own that there is sublimity as well as beauty to be found within his native land. In the passage where Wordsworth patriotically defends the English mountains against the Alps on this very ground, he says that "the sense of sublimity depends much more upon form and relation of objects to each other than upon their actual magnitude"; and again, with a kind of incidental explanation of what he means by "sublimity," "an elevation of 3,000 feet is sufficient to call forth in a most impressive degree the creative and magnifying power of the atmosphere." But the sublimity of this power is relative to the things created and magnified; and here lies the first difference between the Lake landscapes of summer and of early spring. It is not the bare brown peaks of August that stand out clear and knowable against their background of sky or lowering cloud; the woods do not spread green in the sunlight or heavy with August gloom; against the storm-louds and under the morning haze the fitful sun of March shows you a white wilderness of fell and peak, infinitely mysterious and remote, while the woods, slipping in between the snowy summits and the cold reflections in the lake beneath, have an unchanging austerity of tint in spite of all the exquisite variety and beauty of the broad shades. The highest note of colour in the whole landscape is to be found in the larch copses, now a penetrating golden-brown, and to be a month hence the freshest and greenest of spring sights. Coming down from the fell-sides to the valleys, you will find your choice of month justified anew at every step. To those who know the oppressive closeness of a Westmoreland valley in a hot August, there is a perpetual delight in the keen invigorating air which tempts the soberest traveller to play pranks with himself and his strength. Then the streams, those loveliest possessions of the North country—there is no time in the whole year when they are so full without flood, or so clear without an impression of drought. In the valley they have all the small-proportioned, delicate beauties which attract you to them in summer, while up on the fells, born in snow and tossed with the north wind, they are the wildest, loneliest things in a wild and lonely nature.

So much for the world without. Within, under the grey roofs which dot the valley, the welcome accorded you in all the warmer from the fact that the press of summer visitors is still far off, and it is still possible to take an individual interest in a fresh face and voice. From the residents in the substantial grey stone houses each within its shelter of evergreens, who have many of them retained in manners and culture the fine flavour of the old Lake society, down to the innkeeper who lets you a pony almost for the

price of your best rooms and her best speeches, all are kindly disposed towards the spring visitor and inclined to reward him for his venture among them. There is continual amusement, too, in the undress of the little towns, in the photographers without photographs, in the sleepy coach offices and the still sleeper coaches, in the homeliness of the inns, which a couple of months hence will be aping their betters with starched writers and tables-d'hôte. Let the March traveller go into a rural inn away from the towns, and he will probably find the coffee-room given over to babies and cradles, and nobody in the whole house to wait upon a passing guest but the small daughters of the landlord, who make an excitement out of his meal of oatcake and honey, and are friendliness itself if it should be the stranger's fancy to converse. Life has throughout a languid contented air, very unlike the hurry and irritation of the summer. The coach goes once a day along the main thoroughfares, and seven times out of ten the driver and conductor may be met by Grasmere off on Duddell Raise enjoying their usual winter *tête-à-tête*, undisturbed by intruding passengers; so that the spring traveller who finds himself driven in solitary state from Rydal to Grasmere, with coach and pair, driver, and conductor for the sum of sixpence, is sometimes struck with a ludicrous sense of disproportion between means and ends. The coachman is wholly at his ease; it is all he can do to deliver his two or three parcels without dropping them on the road, or to carry the three newspapers which apparently form the whole supply of two parishes. Three months hence who will recognize this amiable and philosophic being in the harpy who collects a coachful of *poorvaires* three times a day with thirty sharpness and precision? If the traveller wishes to experience for himself this lazy mood of the country, he cannot do better than spend the warmer hours of his stay in fishing. A month hence the fishing will be at its best, and may be taken seriously; but now there is no idler amusement in the world than the Rother or the Greta may afford him; and as he wanders along the stream, from quiet valley to distant snow-field, he will perceive nothing stirring but himself and the wind.

It would be ungracious to dwell upon the obvious drawbacks which may lessen the pleasure of an Easter visit to the Lake country. Every one can picture them to himself—the chances of cold, the chances of rain, the certainty of taking the people in a measure by surprise, and the consequent risk of discomfort. All who have tried it would admit that the climber's best reward is to lie at full length on the mountain-top that he has conquered, and to gaze outward in luxurious ease; and in March there is no lying at full length on the mountain. The lazy delights of summer are not for the spring tourist; but then the spring tourist never supposed that they were. The pleasures that he seeks and finds in the hills at Easter are distinct and separate in their kind; if not absolutely better than the pleasures of summer, yet different. More mystery, more sublimity in the distances; a rarer atmosphere, like nothing so much, as we have said, as that of the bright and bracing Engadine; and in the valleys the all-pervading charm of the spring, heightened by contrast with the wintry summits overhead. Quick, too, as are the changes of summer in this strange country, the changes of spring are quicker far. At sunset, after a day of brightness, the clouds may gather and a gusty western wind arise; during the night the rain plunges down and the trees creak in the gale, and in the morning a sun as bright as yesterday's may show you the mountains half cleared of their snow and the winter seemingly gone. But let the wind veer to the north and a second storm follow; another night will retransform the hills and make them Alps again. And perhaps, if one had to say in what the main difference between spring and summer in Westmoreland consists, it would be that in spring-time the changes are more rapid and more surprising, and the contrast between valley and summit, between the kindness of the mountain's shelter and the terror of its brow, is more sharply accentuated, and therefore more fruitful in imaginative pleasure.

THE ARCHBISHOP ON HIS DEFENCE.

THE policy to which our two Primates committed themselves in 1874 is already embarrassing, the wirepullers whose pressure they then unhappily obeyed beyond the power of recovery even by the most adroit and unscrupulous use of Mr. Tooth's extravagances. It has converted the Archbishop of Canterbury into a controversial pamphleteer with an Honorary Canon as his opponent. It has also driven a host of distinguished clergymen, of whom the one thing that might be predicated is that—whether they are High Churchmen of an old-fashioned type or Broad Churchmen of the moderate sort—that which they cannot be called is Ritualists, into an address to the Episcopate, which the *Times*, in a burst worthy of the heaviest father in the last act of the most popular piece, denounces for "its flagrant misrepresentation of the present" and "its reckless suggestions for the future"; while the Archbishop, who ought to be most sore at such misrepresentation and recklessness, informs the Memorialists, in the name of his brethren, that "I can at once take upon myself to assure you that it will receive most attentive consideration."

Canon Carter's pamphlet and the Memorial are varying expressions of the same complaint, that the Church of England—which has, in our own generation visibly grown a little more

parallel—is not merely kept in the same leading-strings which might have been wide and easy for it some sixty or seventy years since, but that they have actually been tightened by the hands of its present nursing fathers. The Canon rather deals with the formal questions of the constitution of Church Courts and Church legislation, while the Memorial, excepting its unfortunately vague conclusion—which, we presume, means little more than “deliver Church interests from being debated by Mr. Bignar or even Mr. Dillwyn,” but which might be perverted as implying a repudiation of Parliamentary intervention in spiritual matters—remonstrates against “events and documents which have themselves always been matters of controversy,” rather than “the living voice of the Church,” being made the appeal on controversies about ceremonial or doctrine. The Archbishop would probably have included both manifestoes in a single reply had he not already completed his answer to Mr. Carter before the appearance of the Memorial, and his letter to the Dean of St. Paul’s displays the restraint from which no writer except Mr. Gladstone can escape who feels that he has to say the same thing twice over in a few days. The Memorialists tried to put a good deal into a few words, as well as to make those words sufficiently civil to be accepted by the dignitaries whose policy they were in fact arraigning while formally appealing to their sympathies. This gave the Archbishop the easy literary advantage of being able to charge them with failing in accurate distinction; and the point on which he fastened was that their paper seemed to confound “ecclesiastical matters judicial” and “ecclesiastical matters legislative”—its whole scope really being that it was expedient that certain matters should be transferred from the judicial to the legislative sphere by ungagging the living voice, and enabling it to provide for them according to the necessities, not of the sixteenth, but of the nineteenth century. But, after all, the Primate argues, what have you to complain of? Has not Convocation been for some years, and is it not now, discussing the very class of subjects about which you seem to be so anxious? To this the Memorialists of course might reply—As you have so far given in to our principle, and are so pleased with yourself for your concession, why now make all these difficulties over a more liberal application of the process to which you have yourself, in the plenitude of your Metropolitan authority, had recourse? This reference of the Archbishop to the revision of rubrics on the part of the existing Conventions sufficiently answers the inference which he attempts to draw, in his letter to Canon Carter, from the admitted anomalies of representation in these bodies as now constituted, as if that were a reason for not employing the actual instrument in anticipation of some uncertain day of possible reform. He is more happy in his reply to the suggestion that the Supreme Court of Ecclesiastical Appeal should be composed of bishops, while he weakens his own logic by resisting the restoration of the old Consistorial Courts of First Instance, on the ground that in them it is not the personal bishop who sits, but his legal representative the Chancellor.

All these considerations, however, are matters of detail compared with the real ecclesiastical difficulty of the moment—namely, the profound irritation which, as the Archbishop and the *Times* seem at last to have discovered, has been caused, not among the Ritualists, but among wide sections of moderate Churchmen at the policy out of which the Public Worship Regulation Act emerged. On this point the Archbishop’s shortness of memory is astounding. He actually seems to believe that that Act is his own measure. No doubt the policy which produced it is his by adoption, since the day on which he and the Archbishop of York gave their blank promissory notes to the Church Association “to put down Ritualism,” which the latter body very reasonably interpreted as a promise to (in the Archbishop’s own felicitous phrase) “press heavily on loyal members of the Church of England who are contented to tread in matters of ritual in the steps of what is called the Catholic school of our divines, holding at once faithfully to primitive antiquity and to the principles of the Reformation.” The first draft of this project was the suggestion, which never got beyond the embryonic conditions of a leader in the *Times*, for some sort of diocesan Committees, which were to be Courts in everything except the power of enforcing respect and obedience to their own conclusions. Then came the Archbishops’ genuine Bill, in which those Committees had blossomed into a series of new diocesan tribunals of the most petty and irritating character. At this stage *even* the Archbishops of Canterbury and York, *introit* the Earl of Shaftesbury. Lord Shaftesbury, at all events, in knowing what he wants, lets the world know it also, and under his remorseless dictation the Primates found their immemorial and independent jurisdictions transformed into a now conglomerated something which it would, perhaps, be safest (at least for the present) simply to describe as Lord Penzance’s Court. Still, Lord Shaftesbury assured the powerless Primates that his intention was to enable them to keep faith with the Church Association, and, as the Church Association believed him, the Archbishops could only smile and accept the changeling as if it were their own original offspring.

These simple facts of history—so pertinaciously ignored by persons in authority—far more than any details of the Worship Act, irritate the great body of that High Church party whose continuous existence is indispensable for the maintenance of the Establishment; and as long as Primates continue to split straws over the beneficent intentions of the Worship Act, the irritation can only go on increasing. The grievance is that they have suffered, not under an Act, but under a policy—under a dark, a changeable and shapeless something—which they felt dogging their steps. It

was impossible for the same men really to like the Archbishops’ Bill and Lord Shaftesbury’s Bill, and yet the same men professed not only to like both Bills, but to see no difference in them, because both had been drawn for the same objects of persecution. Any stick, no doubt, is good enough to beat a dog with; but the High Church party is not exactly a dog; nor ought an Act of Parliament for regulating divine worship to be a stick, while the only stick which persons had been accustomed to see in a bishop’s hand was the crook with which the shepherd gently leads his lambs. The old Episcopal investiture was *per annulum et baculum*, which did not mean the gyve and the rattan.

With the passing of the Act the Archbishops found themselves in possession of the material power involved in the choice of the new Judge. They had a wide field out of which they could have selected some one, who would have been, if not acceptable to the persons against whom the novel jurisdiction was levelled—this would have been almost past hoping for—at all events personally, and by his antecedents, neutral. They had also the far narrower field of those who, from circumstances and not necessarily from any fault of their own, would be directly offensive to men already so deeply offended and sore all over. Of this class, the person who might be trusted most ideally to fulfil all conditions of offensiveness would be a Judge who had been identified with a novel jurisdiction repulsive to Churchmen in proportion as they held the opinions commonly ticketed as “high,” and unsavoury to all decent people irrespectively of theological difference—some former chief of the Divorce Court. With a rare obtuseness to the feelings of those who, having been beaten, might, with safety to the main objects of the Act, have been a little coaxed, the Archbishops sought their new official in an ex-Judge of the Divorce Court, and nominated Lord Penzance. We do not in any way blame Lord Penzance for having taken his former office. The Divorce Court was part of our system, and any respectable Judge who consented to exchange the status of a Pains Judge for the nauseous business on which the newer tribunal subsisted proved himself to be a self-sacrificing patriot. But, at the same time, on all considerations of policy, he disqualified himself from accepting that still newer office the *raison d’être* of which was “to put down Ritualism.” The action of those who put him there seemed, no doubt, courageous to themselves, but in the eyes of the world the courage was quite swallowed up in the eccentricity of the proceeding. It was as if Mr. Cross were to make Mr. Whalley inspector of prisons, or Lord Derby were to send Mr. Gladstone as Ambassador to Constantinople, and Mr. Butler Johnstone as Commissioner to Bulgaria. No doubt there was a reason for the selection, which was avowed with sufficient bluntness by those chiefly responsible for the act. A Judge with a pension is so much considered as morally bound to give in return such judicial work as his strength permits, that Mr. Gladstone’s Government actually made the ineffectual attempt to saddle a Chancellor’s retiring pension with the legal obligation of sitting on appeal. It was accordingly alleged that Lord Penzance would be an economical choice, and the belief prevailed for a day or two that, in the joy of renewed health, he expected no further remuneration than his pension of 3,500*l.* a year.

In the meanwhile Sir Robert Phillimore and Mr. Harcourt Vernon respectively resigned, and, whenever the Court of Arches was convoked, Lord Penzance made his appearance there, claiming to act, and acting, as Dean of Arches, in face of frequent asseverations that, whatever else he might be, he had no right to that designation. This was an awkward complication, and, with a view of throwing some light upon the situation, Lord Limerick lately moved for a return of the appointments of Dr. Lushington as Dean of Arches by Archbishop Sumner, of Sir Robert Phillimore by Archbishop Longley, and of Lord Penzance by Archbishop Tait. These have been produced, and the result is that Dr. Lushington and Sir Robert Phillimore took their places by letters patent from the respective Primates granting to each of them “that you may the better know how and in what manner you are to behave yourself in the exercise of the said office according to what is from law and custom to be known” . . . “finally to determine the said causes of appeal according to law and the custom of the said Arches Court anciently used”; which letters patent were in either case, according to traditional usage, confirmed by the Dean and Chapter of Canterbury. Lord Penzance, on the other hand, had only to show a deed-poll of Archbishops Tait and Thomson with the Queen’s approval appointing him, as for other reasons, so as having been “Judge Ordinary of the Court of Divorce and Matrimonial Causes,” neither to the Deanery of Arches nor to the official Principalship of York, but to that temporary office of a Judge in the Provincial Courts which was by the Worship Act to blossom into the old offices on the resignation of their respective holders, with a footnote bearing the weighty name of Cyrus Waddilove, that upon such vacancies occurring Lord Penzance *ipso facto* sat himself in the vacant seats.

How far the omnipotence of a not yet interpreted statutory enactment may be held to supply the wanting formalities and validate the transaction we dare not speculate. We are dealing with its policy; and we can only say that, if the original selection of Lord Penzance approached the limits of an almost inconceivable eccentricity, the apathy or recklessness which has left him exposed to the charge of being but a cuckoo in the Dean of Arches’ nest without the protection of letters patent or the comforting confirmation from a Dean and Chapter of Canterbury transcends the credible. If there was anything which would either touch the persons whom the Metropolitans desired to

manipulate, or about which they would be touchy, it was the spiritual and traditional origin of the Court asserting itself to be spiritual which claimed their allegiance; and yet these Metropolitans, with the old spiritual forms of appointment handy to follow, forgot or refused to use them. It might a month ago have been urged that it was not too late to mend the omission, and that even now the forgotten formalities could be proceeded with. But unluckily Lord Penzance has himself made such remedial action impossible, if—according to a report which, after remaining three weeks uncontradicted, may be taken as genuine—he has resigned his office. The grounds alleged for this resignation are not a little peculiar. It will not be forgotten that the object of the Ecclesiastical Offices and Fees Bill—lately before a Committee of the House of Commons—was, on the authentic evidence of Dr. Tristram, Chancellor of London, to find a salary for Lord Penzance in addition to the retiring pension. Now that Committee had not at that date reported, and all that had leaked out of its action was therefore mere rumour. Rumour, however, had carried it to Lord Penzance's ears that the Committee had come to the conclusion that no Public Worship Judge ought to have higher pay (any pension he might have earned being included) than the salary of a Puisne Judge; and Lord Penzance, so the report goes, has accordingly resigned. This would be a sufficiently curious termination of a very unsatisfactory epoch of ecclesiastical history. His successor will, it is to be hoped, have letters patent, confirmation, and all other things needful. But in the meanwhile Lord Penzance's judgments as Dean of Arches will stand on record as those of the only claimant to that venerable office who ascended the tribunal unfortified by any of the ancient formalities, and who had to submit, during his whole tenure of office, to hearing his right to it openly denied, and the validity of his decrees called in question, without being able to appeal to the time-honoured forms of his appointment in proof of his legitimate succession.

THE FRENCH ARMY.

AMONG the surprises of the last few years none has been greater than the extraordinary revival of France. Weakened by the unwholesome atmosphere of the Imperial system under Napoleon III., which was consuming as by a slow fever all that was greatest and best in her national character, she was subjected to a terrible shock in her war with Germany. The wounds which she received in the campaign, and the strain placed upon her vital energy by the necessity of paying the periodical instalments of an unexampled war indemnity, seemed enough to crush the strongest and healthiest nation. When to these were added the excesses of the Commune and the internal struggles of various parties, each striving for supreme power over a distracted people, the idea began to be prevalent in Europe that France was but fulfilling the ordinary human destiny by passing, after hot youth and powerful manhood, into the decrepitude of old age with its various pains and diseases. The beaten, like the absent, are always in the wrong, and cannot expect to escape the malicious speech of those detractors who have envied former prosperity and power. And, no doubt, if some "Saviour of Society" had succeeded in applying those external ointments and plasters which sometimes bring about an appearance of health while rottenness is within, France might have succumbed gradually to the effects of the poison in her system. Fortunately for her, the doctors quarrelled so over their etiquettes and prescriptions that the patient was left to nature's hands. The eruption of the Commune broke out, and carried off the worst of the poison. Since then there has been a period of convalescence, of healthy rebellion against potions and pills, and of vigorous though somewhat risky exercise of limbs. A relapse is always possible, but everything is to be hoped from a regimen of self-denial and plenty of fresh air.

An army is but the expression of national force in a certain direction, and we could never have believed in a French army invented at this time by a Saviour of Society. It is because France has had vitality enough to recover naturally, instead of being drugged into cessation of pain, that her present military power is to be trusted; and some of the very faults in her organization for war are proofs of that spirit of compromise which, if carried out in political life, will be the salvation of the country both in peace and war. A "Saviour" who had succeeded in crushing all opposition might have avoided some errors and supplied some omissions in the present organization. He would certainly have carried it further towards completion. But the animated and instructive debates in the Chamber would have been lost, the burdens which the creation of so great an army imposes would have been borne grudgingly, and France would have had an Imperial, Royal, or Presidential, instead of a National army. The hearts of the people would not have gone with it as they go now, and war might again have been undertaken against the national will, and with deficient means, because the tyrant, call him by what name we may, would have been obliged to sacrifice efficiency to the necessity of keeping both people and army in good humour. All this may seem very clear to an Englishman accustomed to the use of liberty at home, and to the difficulty it creates in devising improvements in our own military organization. But a resident in Paris cannot fail to come under the influence of the distrust created by a life spent in terror of the Red spectre on

one side and of Napoleonism on the other; or to be imbued with the healthy spirit of criticism fostered by Parliamentary institutions. In 1875 such a writer charged the then Minister of War with grave faults, and threw discredit on the value of the new organization. His article in *Blackwood* drew much attention to the subject, and a warm debate arose, in which the French themselves took little part. We had no doubt at the time that his strictures were partly well founded, though mixed with considerable exaggeration; and the opinion is confirmed by another article in this month's *Blackwood*, wherein the author represents France as able at last to defend herself against attack from the gigantic forces of Germany. To say that an army utterly crushed and demoralized six years ago is now able to put 455,000 men on the frontier, with 210,000 in the intrenched camps, at the same time having an unconcentrated second line of 325,000, and a depot reserve of 310,000 more, who would be gradually fitted to take their places in the front line—and all this without reckoning the territorial army—is to confess that the measures devised at the beginning, and gradually carried out by one law after another, cannot have been so very bad as the author would have had us suppose two years ago. Given a *tabula rasa*, a people ready to submit to anything that might be proposed by the Government, and no internal political difficulties, it would be easy enough to create a model army; but the creation in six years of such a powerful military organization as France now possesses, in the face of diminished resources, warring political factions, and the ever-present dread of Red Republicanism, argues far greater administrative capacity and national common sense than the author is even now disposed to attribute to the French. Some of his strictures on the laws lately passed are so far-fetched as to suggest the thought that he must have looked with some care in order to find occasions for criticism. For instance, he is very severe on the law of November 1875, and asserts that "it establishes two sorts of military justice—one for the active army, and one for the territorial corps. If a fortress is surrendered by a regular officer, he is liable to be shot; but if its capitulation is signed by a territorial commander, he can only be imprisoned. Crime in one case becomes misdemeanour in the other." In this attack the writer appears to have adopted a curious blunder committed by M. Amédée Le Faure in his valuable book *Les lois militaires de la France*. The fact is that the military courts are permitted, not enjoined, to find extenuating circumstances in certain cases of military crimes committed by officers and men of the territorial army, though the milder form of sentence is forbidden for culprits of the regular army. If extenuating circumstances are found, the punishment is of course one grade less severe. Even had the writer been justified in his statement of facts, he would only have found what is common to the laws of other nations. Germany has a different law for her regular army and for her reserve and Landwehr. England has not recognized the punishment of death for her militia; and Austria even provides that the officers and men of her Landwehr shall be tried by courts composed only of Landwehr. We have given this instance of the writer's fallibility, not to discredit the article generally, but to show that whatever errors may have crept into his statements are likely to be in the direction of fault-finding rather than of inordinate praise. France is at least as ready for a war of defence as he admits her to be.

Now in 1870 the utmost force that could be put in line within a month against the enemy was 250,000 men, and even this comparatively small army was insufficiently provided with many requisites for campaigning. Behind the 250,000 were about 300,000 for reserves and garrisons. This year, according to the statement of the writer, three weeks only would elapse before 455,000 men were in the field, having behind them such a mass of troops for reserve, for camps, and garrisons as would raise the total of the active army to 1,300,000 men; nor must it be forgotten that the services of all these men would be really available, because the lines of communication and other vulnerable points out of reach of the enemy would be sufficiently guarded by the men of the territorial army, which, though not yet thoroughly organized, would be quite capable of performing such subordinate tasks. It is true that good non-commissioned officers are not easily to be found for the reserves and for the territorial army; nor are the inducements of a military life sufficient to retain such men even in the regular army after their legal term of service is expired. But this is a difficulty by no means special to France. Every Continental army suffers from the same want. The man who makes a good non-commissioned officer will be a good tradesman or a good clerk, and there are few indeed of such in any nation, in comparison with the immense masses of men now brought under military control, who would not prefer the comforts and the liberty of civil life to any advantages that can be offered to soldiers in peace. The difficulty is one inseparable from large armies, and no means have as yet been found powerful enough to overcome it. Again, the arrangements for mobilization leave something to be desired, and the decentralization of stores—one of the measures forced on the country by the experience of 1870—is not yet complete, though gradually becoming so. We learn from several sources that the French War Office considers that two years more must elapse before the army will be thoroughly prepared for war, and nothing is more certain than that France is, and will be for some years, bound in heavy penalties to keep the peace. But the question is whether she has advanced so far in her armaments as to be formidable if placed on the defensive. Nearly three years ago the military caste at Berlin had so

far influenced the counsels of Germany that France would have been attacked but for the moderating pressure of England and Russia. With great wisdom and self-control the French Government determined at that time to cause their armies to retreat without fighting, and an appeal would have been made to Europe. Has the time passed for submitting to so dire a necessity? If France were wantonly attacked now, could she defend herself with fair prospect of success?

There can be but one answer from all who know what preparations have been made, and what is now the national spirit. France could not only defend herself, but could do so with full hope of preserving her territory and military honour. She could not mobilize so quickly as Germany, because the dangerous passions of Paris and Lyons have prevented her from introducing complete simplicity into her military system. Rightly or wrongly, she dare not localize her army corps completely. The two uneasy cities have to be garrisoned by parts of the corps belonging to other districts, instead of having corps of their own. For the same political reasons, the eighteen army corps are not, like those of Germany, composed of men taken almost exclusively from their own nominal districts, and ready at any moment to join their own well-known regiments. They are composed of men taken from the whole country and mixed throughout the service. But, when the moment of mobilization comes, the soldiers who have passed through the ranks of the active army, and are then in the reserve, go to the nearest depôts to be equipped, and thence, as a rule, to the nearest regiments, whatever the regiments quartered near them may be. Mobilization is not, therefore, much delayed from this cause; and the device seemed good enough to be adopted in our English scheme of mobilization.

The French plan of calling out the reserves by placards in the public streets is so practical that the Germans have now adopted it; and the general result of the changes in the arrangements for mobilization is that five days only would be required to place the reserves in the ranks of their battalions and companies, whereas in 1870 the same work was calculated to consume seventeen days, and at the end of that time it was not complete. The writer in *Blackwood* says that it is impossible to judge how long the concentration would take which would bring all the regiments into brigades, divisions, army corps, and armies. But he does not say—what is, however, well known—that every detail of arrangements for marches by road or transport by rail is now carefully worked out beforehand in peace on various probable suppositions. In this respect the work of the General Staff at Berlin has been copied in Paris with such modifications as were found necessary to adapt the system to a wealthy nation, the traffic in which is much greater than in Germany. Reckoning up together all the quickening and retarding forces, it is probable that the French concentration could be performed in about the same time from the first measure of mobilization as that found necessary by the Germans in 1870—namely, three weeks—and we are inclined to think that the time named is rather greater than less than would be required in practice. On the other hand, Germany has since then greatly reduced the duration of her own mobilization and concentration, and would be ready before France, if there were a question who should be the invader. For this and other reasons France cannot be the aggressor, and it would be an outrage on common sense to represent Germany as having any immediate danger to fear from the revival of military power in France. Immediate danger, we say, because there is, no doubt, a remote but very real danger. Money must be counted for something in preparation for war, and for still more in the power of a nation to bear the burden of constant warlike preparations in peace. And the difference in the power of the purse may be estimated when we remember that France has, since the signature of peace in 1871, not only paid 200,000,000*l.* to Germany, but actually spent about as much in renewing her own armaments. She bears her burdens lightly, has surpluses, and pays off her debt gradually by means of a sinking fund. Seventy millions had up to last year been spent on extraordinary military expenses, which will presently be no longer required; for most of the new fortifications are built, and the armaments have been, or are being, gradually supplied. The whole of the artillery has been re-armed, and the infantry weapon improved, so we may say that in a year or two the French annual war budget will probably show a very considerable decrease. On the other side, Germany, though nearly free from debt, can hardly support the financial strain. Trade is everywhere depressed, the youths taken for the army are sorely needed at home as bread-winners, and the millions obtained from France, after raising prices and setting up a fictitious standard of wealth and luxury, disappeared, leaving behind them all the new cravings begotten of temporary prosperity, without the means of gratifying those cravings. France is richer than she was before, inasmuch as her marvellous resources are known and can be counted on. Germany is poorer, just as a man reduced from the enjoyment of a thousand a year to a pittance of a hundred is poorer than he who has never had more than a hundred or lived among wealthier people than himself. The experience of this inequality of resources, the view of France calmly arming before their eyes for a future fight, has naturally been a source of great irritation to the German people. Europe has again and again trembled on the verge of new catastrophes, and statesmen may well give a sigh of relief if, as we believe, it is at last true or nearly true that France, able to hold her own in a defensive war, but now and for a long time to come unprepared for offence, has become a conservative Power in Europe. With Germany on one

side and Italy thinking of Nice and Savoy on another, with her heavy debt and internal difficulties, we need fear no aggression from her. She has given too many hostages to fortune.

RELIGIOUS THEATRICALS.

A CURIOUS case was heard the other day before the Sheffield magistrates as to the lawfulness of performing religious plays. It appears that a drama entitled *Joseph and his Brethren* had been enacted at the Albert Hall in that town on Easter Eve, and a summons was taken out against the performers by the proprietors of the Sheffield Music Hall which had three years ago been engaged for the same purpose, which purpose they had been obliged to abandon on learning that the procedure would be illegal, and had thereby suffered serious pecuniary loss. The magistrates decided that the play, not having received the licence of the Lord Chamberlain, was illegal, though he inflicted only nominal damages. As to the performance itself, it came out at the trial that "two donkeys and some bipeds were on the stage," and the latter carried on a sustained dialogue, though the donkeys did not bray. There was a proscenium with footlights in front of the organ, and a drop-scene representing Jacob and his ladder; and the actors, twelve or thirteen in number, wore "ancient costumes" consisting of "a white sloop and red belt and trimmings." The "bipeds" taking part in the play appear not to have been regular actors, but artisans, warehousemen, cutlers, and coopers. Whether the affair proved a dramatic success is not stated, but we shall probably be not far wrong in assuming that it did not rise much above the level of the strange performance of *Mosses Beck* enacted, as our readers may remember our noticing at the time, last autumn in a Welsh Baptist Chapel. How far the theatre, whether secular or sacred, is conducive to the cause of public morality or otherwise, is a wide question on which the most opposite opinions have prevailed in every age. Within the last few weeks the discussion has been raised among ourselves, first by two addresses of the Bishop of Manchester to the members of the dramatic profession during the recent mission held in his cathedral city, and next by the republication of a lecture of Dean Close's, delivered some twenty-five years ago, with supplementary comments on the dangerous teaching of "that greatly mistaken member of our Episcopal Bench." Dean Close pronounces a sweeping indictment against all plays, actors, and playgoers, ancient and modern, which might have emanated from a doctor of the old Sorbonne or a Puritan divine of the seventeenth century. All scenic performances are unmixedly demoralizing, the profession has ever been justly branded as "infamous," and those who patronize the stage are not much better than those who serve it. Into that controversy, however, we need not enter here. The performance of *Joseph and his Brethren* was, it appears, forbidden by the Lord Chamberlain for the precise reason that it deals with sacred subjects; and we are far from meaning to say that he did not exercise a wise discretion in prohibiting it. No intelligent votary of religion or of sacred art would wish to see the Ammergau Passion Play suppressed as long as it retains its present unique position and unique excellence. But it would be a very different matter to have anything like a popular revival attempted of the mediæval miracle plays—whether presented in theatres or in churches—under social and religious conditions having so little in common with the "ages of faith." At the same time the prohibition of a religious play, as such, almost inevitably recalls to mind the undoubted fact that the origin of the drama, both classical and Christian, was essentially and purely religious. This fact is perhaps the more remarkable from the bitter, and by no means always or wholly unreasonable, hostility which has nevertheless usually existed between the Church and the Stage. A brief historical sketch indicating the state of the case may not be without interest.

We need hardly remind our readers of the passionate devotion of the Athenians to the drama, which attained in two hands of the great Attic tragedians and comedians a glory which the lapse of two thousand years has not obscured. The Romans under the Republic strictly prohibited all theatrical representations except such as were directly connected with the worship of the gods, and the first theatre at Rome was erected by Pompey. Hence the Roman drama never approached the Greek, and very soon the position of an actor became so degraded as to involve perpetual slavery. The gross realism which ran through all Roman ideas and institutions, and found its culminating expression in the deification of living Emperors, resulted on the stage in the actual perpetration "*coram populo*" of crimes which, according to the Mosaic canon, and indeed according to the elementary rules of common decency, ought not even to be represented there. "*Omnia fiunt ad verum*," as Juvenal complained, and the sixth and seventh commandments were publicly violated with every circumstance of revolting horror, not in figure but in fact. Nero indeed endeavoured to relieve actors from the stigma attaching to them, but it is hardly wonderful that the moral influence of his patronage should have been small. Yet to the last the Pagan theatre was closely connected with religious observances, and the temple was not unfrequently the scene, and the deities the subject, of its vilest orgies. This of course only supplied an additional motive for the unsparing condemnation of the whole institution, root and branch, by the Fathers and Councils of the early Church. They naturally enough regarded it simply

as a school of depravity and idolatry from which the faithful must escape for their lives as they hoped to be saved. No actor could be baptized without first renouncing his profession, and a Christian who embraced it was *ipso facto* excommunicated. By slow degrees, and not till long after the conversion of the Empire, the old Roman drama died out, and the modern stage, equally derived from a religious source, began to take its place. A Scriptural play of which Moses was the hero was composed by a Jew in the second century, and St. Gregory Nazianzen wrote a Passion Play in the fourth, but the time of public performances was much later. In the thirteenth century St. Thomas Aquinas discussed the abstract question of the lawfulness of the histrionic profession, and decided it in the affirmative; "*officium histrionum, quod ordinatur ad solatium hominibus exhibendum, non est secundum se illicitum.*" At first Latin plays were acted in the churches by priests and monks, but by the close of the thirteenth century the sacred drama had come to assume a popular form, which too often degenerated into the coarsest profligacy and indecency, and helped constantly to bring the Church and the faith of the Church into disrepute. When we are told how in France, whenever the seventh commandment was to be broken, the actors retired behind a curtain—whence the origin of the French proverb "*Derrière le rideau*"—it is impossible not to be reminded of the spectacles of *l'agon* Rome. Nor do things seem to have been much better in England, where in the fifteenth century, as Malone tells us, Adam and Eve were produced on the stage in their primeval aspect. The "*Feast of Fools*" and the "*Feast of Asses*"—said to have originated in the Eastern Church—the "*Boy Bishop*," and other kindred performances undoubtedly contributed, as readers of Scott's *Monastery* will not need to be reminded, to that general loosening of reverential ties and associations which preceded and partly caused the outbreak of the Reformation.

With the sixteenth century came the beginnings of the purely secular stage, growing up at first, curiously enough, in Italy under the patronage of Popes and dignified churchmen. But from the first the Gallican Church, which always exhibited the more primitive and austere side of Catholicism, set itself sternly against the theatre, and never relaxed its opposition till both alike were temporarily swept away in the storm of the French Revolution. In 1694 the doctors of the Sorbonne decided that the profession of comedians involved them in mortal sin, and accordingly no actor who had not abjured his profession could be admitted to the sacraments in life or receive Christian burial. Bossuet points out, in his *Réflexions sur la Comédie*, that the directions of the ritual on this head are precise, and the practice of the Church constant in accordance with them. Racine in consequence left off writing for the stage, and in 1761 the work of a lawyer composed in defence of it was burnt by the hands of the public executioner, and his name struck off the list of advocates by a decree of Parliament. In Spain and Italy the opposition was less vigorously maintained, and even at Rome a sort of compromise was effected. Benedict XIV. allowed dramatic performances during the Carnival; and in 1671 an opera-house had been built in Rome, though it was not till later that female singers were allowed to appear there. It should be added that the French Calvinists were no less emphatic than their Catholic fellow-countrymen in their sweeping denunciations of the theatre, following the example that Calvin himself had set them at Geneva. One of the first acts of the English Puritans during their brief period of dominion was the suppression of the theatre. That these religious censors of the stage both in our own and in former days have much to say for themselves, there can unfortunately be no question. But the experience of all civilized nations, of the ancient and modern world alike, goes to prove that the histrionic taste, whether in its secular or sacred aspects, is based on human instincts, which may indeed be rough-riden or ignored, but cannot be expelled. The Welsh Dissenters, the Sheffield artisans, the Amnargau peasants, and the ordinary frequenters of a London theatre bear witness in their several ways and degrees to a common fact of human nature, which legislators, moralists, and divines would perhaps show their wisdom in seeking rather to regulate than to repress.

A LIVELY WEDNESDAY.

EVERY week it is becoming more evident that there is just now some strange electrical element at work in the House of Commons which is acting in a very uncomfortable way. We have already given some instances of its influence on one important personage; and the incidents of the debate on Wednesday on Mr. Waddy's Newspaper Registration Bill furnish another striking illustration of the explosive tendency which seems to prevail just now in this branch of the Legislature. It is probable that, if Horace could return to earth, and have an opportunity of observing Parliamentary manners at the present time in London, he would be tempted to assign the palm for irritability, not to poets, but rather to politicians. As a rule, Wednesday is, as everybody knows, a dull and somnolent day in Parliamentary life. There is a morning sitting, the attendance of members is usually very sparse, and the subjects discussed are not of an exhilarating character. At first sight this was very much the aspect of the assembly when the proceedings began on Wednesday last. A handful of languid legislators, who had apparently come for repose and gossip

rather than for anything more serious, were dotted about on the green benches. Only some minor officials were present on the Treasury bench, and the front Opposition bench was entirely vacant. There was, in fact, no trace of interest in, or even attention to, what was going on. A speaker was on his legs explaining a Bill for which he asked a second reading, but nobody seemed to be listening, not even the member who was—with a space between—the only other occupant of the bench where the orator had risen, and to whom the latter seemed to be chiefly addressing his remarks. It was Mr. Waddy who had the ear of the House, and Mr. Waddy is not a very rousing speaker, nor did his subject seem to be of an exciting kind. The question which he raised was, in fact, a comparatively simple one, though perhaps not quite so simple as he plausibly represented it. It related to an Act of 1869 by which a previous statute of William IV.'s reign had been repealed, on the alleged ground that it had been devised in troublesome times and that the necessity for it had passed away. The law thus cancelled contained two parts—one relating to newspaper stamps, and the other to the registration of the persons responsible for the publication of a newspaper; and while Mr. Waddy admitted that, as regards the stamps, it was properly repealed, he contended that the need of the other provision as to registration existed just as much as ever, and ought to be revived. In his opinion the abolition of this stipulation arose only from inadvertence, and it had the effect of creating a great difficulty in proving who was responsible for a libel in a newspaper. There had been since then, he said, notorious instances in which newspapers had conducted themselves in the most disgraceful manner, and in which it had formerly been the right of aggrieved parties to bring actions for libel or criminal proceedings; yet, though it was well known who were the guilty parties, the technical difficulty of identifying them had been so great as to enable the culprits to escape punishment. The power of the press, he also argued, was enormous, and it was right that it should submit to restrictions which its very influence and power rendered necessary; but, practically, the present system of obtaining redress was quite inadequate, for there were cases when, for example, "you had to deal with persons who were lost to all sense of decency and morality," and "deliberately set themselves to be a nuisance to society, and to inflict injury upon their fellow-countrymen, by pandering to the very vilest tastes and lowest and basest inclinations of the people"; and such persons could not be adequately dealt with by merely "extracting from them some portion of the money which came stained with some of the iniquity to which they had pandered." They must be made, he held, to suffer in person; but the question was how to get at them. At present it is the rule that the name of the printer and publisher of every newspaper shall be printed on it; but this, of course, does not necessarily ensure that either of the persons whose names are thus advertised is the one who ought to be held responsible at law. He might be a mere nominal agent, and a man of straw. And Mr. Waddy gave an instance of this, which, though he mentioned no names, will be easily recognized:—"A man was reviled in a newspaper; he found out the name of the printer, and on the front of the publication the name of the reputed editor; but that did not assist him, as he had to ascertain who was the real person against whom his action should be brought." On these grounds Mr. Waddy proposed that, when a newspaper was started, a declaration should be made at the office of the Attorney-General, not only setting out who was the publisher and the printer, but giving some knowledge of the responsible proprietors.

It will be seen that Mr. Waddy's argument was, on the face of it, plausible enough. There can be no doubt that the press would have an immense power of doing mischief if it were left unchecked, and that there ought to be some method of inflicting punishment for libels by such organs, as there is in the case of libels by individuals; and this principle was generally admitted in the debate. At the same time, there is a question as to the best means of enforcing this responsibility, and it was from this point of view that the Bill was opposed and defeated. It was pointed out that the measure, while possibly remedying an existing defect in the law, was of a very complicated and oppressive character, and would amount to an unfair interference with personal freedom. Mr. Cowen, who was one of the chief spokesmen for the newspaper proprietors, asserted that a member of this class was at present treated with exceptionable rigour and severity. He was liable to heavy expenses in defending civil actions for libel, and to personal arrest in cases of criminal information, even though the offence alleged was committed without his participation or knowledge. There was also a great uncertainty as to what constituted a libel, one Judge taking one view and another. In a recent case which he cited, it had been decided in one Court that a perfectly fair report of a discussion at a meeting of a Board of Guardians, in which a medical officer was censured, was a libel on the part of the newspaper which published it, because the matter was not of sufficient public interest; while a superior tribunal, acknowledging that it was a matter of public interest, held that the occasion was still not a proper one for publication. Mr. Cowen admitted that every profession had its black sheep, and among newspaper people there were black sheep as well as elsewhere; but newspaper proprietors ought not to be subjected to exceptional restrictions and penalties, such as were imposed on no other trade. There were, he said, 1,700 newspapers published in the United Kingdom, and there was an

average of about fifty cases for libel during the year, or one a week; and the law afforded many opportunities for oppression in this way; but there were not more than one or two cases in which proprietors had tried to evade their responsibilities. He therefore moved an amendment to the effect that the compulsory registration of the proprietorship of newspapers ought not to be enforced unless there was also a provision for the repeal of the exceptional law rendering proprietors criminally as well as civilly responsible for the acts of their subordinates. Dr. Cameron expressed a similar view; newspaper proprietors had no objection to full civil responsibility for their subordinates, but they objected to the vicarious responsibility which the Bill would fasten on them. Sir C. Russell, as an independent observer, remarked that it was well known that there was a class of newspapers established to vilify private character, and the public was entitled to protection against them.

So far two sides of the question were presented to the House; the one being that the public required more facilities for proceeding against newspapers which published libels, and the other that newspapers were already too much harassed and oppressed by unnecessary restrictions. In both of these views there is a degree of truth; and the question became how a compromise could be arranged. Mr. Butt objected to an invasion of private affairs, and also to making an employer criminally responsible for an act of a servant which he has not directed; and suggested that the publisher of a newspaper should be registered, and that it should be enacted that, if damages in a civil action were given against him, the proprietor of the newspaper should be held responsible for them. The Attorney-General took much the same view. He thought that no one should be liable to be prosecuted criminally for what appeared in newspapers, unless it were absolutely proved that he had personal knowledge of the insertion of the libel or had directed its insertion; but, on the other hand, considering the pain and injury caused by libels, it was essential that somebody should be responsible for what was printed in a newspaper. This, in fact, is the real point of the question, how to bring home the punishment of a libel to the person who actually circulates it; and this might be done without either invading the legitimate privacy of newspaper proprietors or exposing them to criminal penalties for acts done by their underlings without their knowledge and sanction. The practical solution would therefore be, as Mr. Butt and the Attorney-General suggested, to provide that proceedings should be taken against the registered publisher of any newspaper as the representative of the proprietor, which should be liable for any damages imposed in an action for libel; and this ought not to task very hardly the ingenuity of Parliamentary draftsmen.

Up to this point the debate had gone smoothly enough, and it might very well have ended here. But it was soon apparent that a storm was brewing. Dr. Kenealy unfortunately chose to take part in the discussion, and it then assumed another aspect. He went into an argument to show that the press has a right to expose "persons who were guilty of infamous, corrupt, and profligate conduct"; and that "the real reason why the present system of proceedings in libel cases failed was that those who complained dared not face their alleged libellers by going into court against them." As to protection for the public, he thought it had protection enough already, inasmuch as the owner of the copyright and the owner of the printing-press were usually in a respectable position, and could be proceeded against. He added that he was not an advocate for libel, but for outspokenness, and this was received with ironical cheers, upon which he expressed his "scorn and contempt for the miserable exhibition which the House had just witnessed on the Opposition benches." It may be thought that this was hardly within the limits of Parliamentary language, and that the Speaker might well have called him to order; but the vein was struck, and Mr. Sullivan immediately followed it up. "With one exception, the journalists of this country had," he said, "when challenged to account for the contents of their pages, manfully avowed their responsibility; once, once only in his memory, had a man professing to own a paper shown himself a slave and a coward." And he asked, as to himself, "what would be said if he, who had four members of his family connected with him in bringing out publications, should take to publishing libels, and put at the head of his paper 'Edited by Sullivan,' in order by that mean and despicable subterfuge to baffle any honest man who might have been calumniated in his pages." Up to this part of the discussion, although strong remarks had been made as to the injury done by a certain class of libellous newspapers, the language had been general, and no names had been mentioned, though no doubt it was generally understood who was referred to. Dr. Kenealy, having come forward as he had done, had exposed himself to criticism of his own acts. He had deliberately justified the publication of a journal which owes its circulation to scandalous abuse of public men, imputing to them "infamous, corrupt, and profligate conduct"; and, if nothing had been said to show the strong and universal feeling of the House on this subject, Dr. Kenealy might have used the silence as a condonation of his offence. Mr. Sullivan was therefore perfectly entitled to refer to Dr. Kenealy's conduct in connexion with a notorious journal which bears the name of his family; but it was unnecessary and irrelevant to go back upon Dr. Kenealy's previous life. Moreover, the expressions which Mr. Sullivan used were certainly not of a kind that ought ever to be heard in the House of Commons, and the Speaker might have been expected to interpose. Afterwards, when the two members met in the lobby, an altercation arose;

and when the matter was brought before the House the Speaker of course found that the House had jurisdiction beyond its formal limits, and Dr. Kenealy was, by a vote of the House, compelled to apologize. It is much to be regretted, however, that such a scene should have occurred; and it is to be hoped that some means of preventing the violence of language which seems to be now spreading may be devised.

A CARDINAL ON ROMAN HISTORY.

CARDINAL MANNING keeps us at work. At the very time when we were saying what we had to say about his exposition of the latest stage in Roman ecclesiastical history, we were musing as to what he had been saying, in some sort at the same moment, on some much earlier pieces of the history of Rome, alike of her Pontiffs and of her Emperors. As a rule, the Cardinal is not lucky in dealing with remote times. He has more than once before now made himself memorable by attempts at expounding English history which cannot be called happy. Perhaps few people have carried in their heads till now the Cardinal's grotesque pictures of the reigns of John and Henry the Third; yet it is something to see those reigns as they appear to one with whom it is a supposed moral duty to reconstruct the facts according to a theory, and that a theory which no Englishman of the thirteenth century would have understood. Moreover, while taking upon himself to rebuke the supposed inaccuracies of certain writers, while venturing to speak of "the nursery tales which passed for history in England," the Cardinal added to them a tale which differed from such nursery tales only in this, that it must be a very Ultramontane nursery indeed in which it is likely to be told. When the Cardinal told us that Innocent the Third condemned the Great Charter, not because he disliked its contents, but because he disliked the way in which the Charter had been won, the subtle point which he raised was one of no importance whatever to any human creature except Innocent the Third himself and those who are bound to make out a case for every act, and even every thought, of Innocent the Third.* But when the Cardinal went on to tell us that the barons and people of England consented to the Pope's deposition of John, it was time to turn to our books and to explain that the Cardinal had made the slight slip of confounding the barons and people of France with the barons and people of England. But the Cardinal is not satisfied with thus cutting his fingers with the history of his own island; he must needs go and cut them still deeper with the ancient history of the city to one form of which he has transferred his allegiance. In an Easter discourse reported in the newspapers, he has been rashly meddling with the early history of Christian Rome. To be sure, he did a little in that way in the same discourse in which he set forth his theory of the Great Charter. He there told us what in plain words comes to this—that the Empire had always depended on the Papacy, and that the Pope had an acknowledged right to depose the Emperor. This is one of those things which it is hard to argue against. If we tried to dispute with the Cardinal about the matter, if we asked for any proof that either the Emperor or the world in general acknowledged any such power, he would doubtless put aside such questions as not to the point. The power would have, in his eyes, quite as much acknowledgment as it needed, if any Pope chose, as some Popes undoubtedly did choose, themselves to assert the power. That there are at least as many cases of Emperors deposing Popes as there are of Popes deposing Emperors would be easily set aside by saying that, whenever an Emperor deposed a Pope it was a case of usurpation, while, whenever a Pope deposed an Emperor, it was the exercise of a lawful jurisdiction. In this way the dispute might be carried on for ever without either side getting one step nearer to conviction. Still, after all, there are some questions of mere fact involved in the dispute. It can hardly be denied by any one who looks simply to the recorded facts of authentic history that the jurisdiction of the Emperor over the Pope was at any rate exercised long before the jurisdiction of the Pope over the Emperor. If the Pope had from the beginning a divine and eternal jurisdiction over the Emperor, including a right to depose the Emperor, that jurisdiction, to say the least, was fated to slumber for many centuries. But what is lacking in history may possibly be made up in legend; and it may be that a discourse delivered as a religious exercise in the Pro-Cathedral may be held to be less strictly bound by the laws of historical criticism than when the same author gives the world his thoughts in the more secular shape of an article in the *Contemporary Review* or the *Nineteenth Century*. At all events, we have before us two reports of a discourse by the Cardinal, according to one of which at least he does seem, as perhaps he was entitled to do, to assume the existence of a very large allowance of faith on the part of his hearers. The odd thing is that the most remarkable part of the discourse, as it appears in the report in the *Daily News*, does not appear at all in the report in the *Times*. Still it is more likely that the *Times* should, for any reason or through any accident, have left it out, than that the *Daily News* should have invented it or dreamed it. We assume therefore that the substance is genuine, giving the Cardinal the usual benefit of any pranks of reporters with regard to particular expressions.

The Cardinal then, according to both reports, begins by saying that, as there is an Eastern question, so there is also a Roman question. And, according to the *Daily News*, he goes on to say

* See *Saturday Review*, December 11, 1875.

that of the Roman question there is but one solution. That solution is "the divine commission given by Jesus Christ to His disciples." Well and good; but surely something must have been left out between this and what comes next; for to common understandings the leap seems a rather bold one:—

The Pope of Rome had never been a subject of secular authority, and, without speaking prophecy, never would be. After 300 years of persecution, the first Christian Emperor, Constantine, saw the incongruity of two sovereigns reigning in the same capital, and he therefore founded Constantinople, and removed thither, leaving the head of the Christian Church in the capital of Christendom, the city of Rome.

We are here landed in the old controversy about *de jure* and *de facto*. The Cardinal can hardly mean to say that the early Bishops of Rome were not subject *de facto* to the secular power of the heathen Emperors. Every tale, true or false, of persecution and martyrdom does of itself imply this kind of subjection. And those who go by history instead of legend will find that the Bishops of Rome were just as much the subjects of the Christian Emperors as they had been of their heathen predecessors. But of course in all cases, whether the Emperor be Diocletian or Justinian or Henry the Third, the Cardinal will equally say that the exercise of Imperial authority was only *de facto* and not *de jure*. Again we cannot argue on these terms; but we may wonder at the monstrous legend, the "nursery tale," to quote the Cardinal's own words, which he puts forth as his account of the foundation of New Rome. We wonder whether he really believes in the legend of the baptism and the leprosy and the porphyry bath. It really looks like it, when the motive for the foundation of Constantinople is said to be that Constantine "saw the incongruity of two sovereigns reigning in the same capital." There is something grotesque beyond words in the notion of the Emperor and the Bishop of Rome being alike sovereigns and alike reigning in the fourth century. But, for aught we know, some doctrine of non-natural senses might lead to such strange uses of language. If the Pope was not actually a sovereign, he ought to have been one; if he did not actually reign, he ought to have reigned. So he may be said to have been a sovereign, and to have reigned, by the same kind of license by which a certain inscription in Rome itself enlarges the list of English kings by a James the Third, a Charles the Third, and a Henry the Ninth, whose reigns are quite unknown to us here at home. But the motive which the Cardinal's legend attributes to Constantine is one which curiously illustrates the popular confusions as to the places of Imperial dominions in Constantine's age. If Constantine moved to Byzantium out of deference to the Bishop of Rome, it could hardly have been from the same motive that Diocletian moved from Nikomedeia, and Maximian to Milan. Or again, does the Cardinal think that it was simply with the same view of leaving Rome quite free for the Pope that Constantine had himself reigned at Trier, and his father, still further off, at York? The legend, not at all unnaturally, brings Old Rome and New into a distinct opposition which did not exist at the time. It supposes a sudden change, a sudden transfer of the seat of empire from the Old Rome to the New, which never happened. It is one of the hardest things to make people understand that, if by the seat of empire we understand the ordinary dwelling-place of the Emperor, Rome had ceased to be the seat of empire some while before Constantine enlarged Byzantium into Constantinople. It needs some grasp of the state of things to take in that some half-dozen other places, from Antioch to York, had already supplanted Rome, and that all that Constantine did was to make a better choice than any of his predecessors, and to inaugurate his choice in a more solemn manner. That is to say, while his predecessors had simply established themselves in existing cities, Constantine founded a new city, or at least so greatly enlarged an old one that it might pass for the creation of a new one. But before him, just as much as after him, Rome had really been ruled from some one or other of the cities which had supplanted her. Rome was occasionally visited by Emperors; its possession was a point of importance in wars between rival Emperors; but it had ceased before Constantine's day to be the ordinary dwelling-place of the Augustus, or even of the Cæsar. What Constantine really did was, whereas other Emperors had simply forsaken Rome for other cities, in some sort to transplant Rome herself to another site.

Yet even out of legends something may be learned, and it is always curious to see how they arose. The notion that Constantine was the first Emperor to forsake Rome for another dwelling-place was naturally enough suggested by his formal inauguration of Constantinople as the New Rome. Nikomedeia and Trier had not been thus solemnly honoured. The establishment of Constantinople did not set aside Trier as an Imperial dwelling-place; but its specially solemn establishment reduced Trier and every other Imperial dwelling-place to a rank altogether secondary. Nikomedeia it set aside altogether. That is, the experiment of Constantine succeeded better than the experiment of Diocletian. Constantine, by his wiser choice, called a new power into the world, a power which has gone on to our own day. Constantinople did really become the New Rome for ever. Trier, Ravenna, and their fellows, sank out of notice. It was no wonder then that they should be forgotten, and that the act of Constantine should be mistaken for the first act of the kind, for a deliberate transfer of the seat of the Roman power from the Old Rome to the New. Add to this that it so happened that, just at the very moment before Constantine set up the New Rome, a gleam of renewed importance had flashed across the Old. Maxentius had dwelled more at Rome than any Emperor for some time before him or after him,

and the defeat of Maxentius by Constantine at the Milvian bridge was one of the most striking incidents of the time. The possession of Rome was the immediate object of dispute between the contending princes. In a certain sense, though not in the sense implied by the legend, Constantine did move from the Old Rome to the New.

Then, too, the motive mythically assigned to him, that of leaving Old Rome to its Bishop, is in some sort the reflection of the results which really came of the act of Constantine. Constantine did not leave Rome in order that the Bishops of Rome might reign; but the Bishops of Rome gradually came to reign because the Emperors had left Rome. The difference between the temporal position of the Bishops of the Old Rome and the Bishops of the New comes of the fact that the Emperor was always at hand in the New Rome, and was hardly ever at hand in the Old. The Bishops of the forsaken capital gradually grew into sovereigns, and they grew into sovereigns because the real sovereign was not there. It was an easy turning about of things to say that the real sovereign took care not to be there in order that the Bishops might grow into sovereigns. But Constantine, Justinian, Charles, and Otto would alike have been amazed at the doctrine that the Bishop of their ancient, though forsaken, capital had ceased to be their subject, because their ancient capital had been forsaken. They would have been yet more amazed at the doctrine that their ancient capital had been forsaken of set purpose in order that he might cease to be their subject.

THE GOVERNMENT AND THE CATTLE PLAGUE.

WHEN a Government department is in want of information, a Select Committee is a very proper instrument through which to seek for it, and, if we are to assume that the Privy Council is really unable to determine the effect which the importation of live animals has upon the introduction of the cattle disease, or to pronounce how far such importation is essential to the food supply of the country, the object of Lord Sandon's notice of motion is sufficiently plain. The Government are confronted by a fresh outbreak of the cattle plague in this country. On the one hand, they are urged to prohibit the importation of live cattle, through which the infection is conveyed to English stock. The efficacy of this remedy is undoubted; but the possibility of applying it without producing a rise of prices not much less disastrous than that caused by the plague itself has often been questioned. On the other hand, they are implored not to diminish the already inadequate supply of meat in order to save the cattle-farmer from possible loss, and thus benefit a particular class at the expense of the community at large. The decision which of these representations shall be attended to when the moment for choosing between them comes undoubtedly depends on the two considerations set out in Lord Sandon's notice. If it is the importation of living animals that brings the cattle plague, it is plainly wise to check it at the first symptom of danger, unless the effect of this measure would be to make meat still scarcer and dearer than it is made by the disease with which we are dealing. Although, however, Lord Sandon's definition of the scope of the Committee's inquiries is sufficiently appropriate, it is hard not to feel some doubt as to the need for further inquiry on the subject. Is our knowledge about the cattle plague so elementary that, without the aid of a Select Committee of the House of Commons, the Government cannot undertake to pronounce how the disease is brought to this country, or what would be the consequence of prohibiting the importation of live cattle? We thought it was generally acknowledged that the rinderpest is not indigenous in this country, and that if no live cattle came from abroad there would be no more outbreaks of cattle plague. If this is the case, what possible good can come of an inquiry into the effect which the importation of live foreign animals has upon the introduction of disease into this country? The effect that the importation of live foreign animals has upon the introduction of disease into this country is that it introduces it. If there were no importation, there would be no disease, and for all practical purposes that is knowledge sufficient. So again with the question how far such importation is essential to the food supply of the country. We thought that it was acknowledged that 95 per cent. of the meat consumed by the people of this country is bred at home, and that of the five per cent. that comes from abroad three-fourths are consumed in London. If these facts are undisputed, two things seem to follow. First, prohibition of importation would only deprive us of one-twentieth part of the total supply. Secondly, against even this deprivation there must be set the diminution in the supply caused by the restrictive measures that are applied as soon as an outbreak of cattle plague occurs. Consequently, apart from the consideration of the possible destruction of the main source of our supply, the benefit arising from the importation of live cattle at ordinary times is qualified by the annoyance arising from the restrictions on the movement of home cattle whenever there is any fear of the cattle plague. What can a Select Committee add to these facts? Of course if they are not facts, if the Government is not sure whether the meat supply does not depend upon foreign importation to a greater degree than is generally supposed, it is very proper to make further inquiries. At present, however, it looks a little as though the Government had not quite the courage of its knowledge, and

wanted to get the support of a Select Committee before proposing further legislation. This may easily turn out to be a less prudent course than it seems. A Select Committee which has only pretty well-ascertained facts to inquire about is sure to come to its work with perfectly formed opinions; and as those who are known to object to the prohibition of importation of live animals must be represented on the Committee equally with the other side, the probability is that there will be virtually two reports, and that when the inquiry is over the Government will find that the appeal to a Committee has had no result except to make legislation more difficult and invidious than it was before.

At the last meeting of the Council of the Royal Agricultural Society an important Report was presented by Professor Brown of the Veterinary Department of the Privy Council. This Report shows very plainly how difficult it is to enforce precautions against the cattle plague when once it has got a footing in the country. The owners of stock seem to be very indifferent to the danger, thinking perhaps that, as a large part of any loss they may suffer will be repaid them by the Government, it is better to run the risk of the disease attacking their stock than to incur the certain cost and inconvenience of keeping them in strict quarantine. In by far the majority of instances, says Professor Brown, the late outbreaks have been caused, not by contact with diseased animals, but by contact with persons or substances that have themselves been in contact with diseased animals. Several instances of this are mentioned in the Report. Although, whenever the cattle plague has appeared in the neighbourhood, the owners of dairy stock are empowered to forbid the entrance of any persons into their premises without permission, such prohibition is never enforced, and it has been publicly stated that men known to have been in contact with diseased animals are allowed to go away without being disinfected. A man whose business lies about cattle may easily be employed on more farms than one, and in that case here is a vehicle of infection in full and constant working. It is known that milk churns and other similar apparatus are moved from diseased farms without disinfection, and, as it is not likely that they are taken away simply to be unused, we have here another certain mode of conveying the disease which is known to be in operation. Again, the fodder and manure of diseased animals has to be disposed of somehow. The proper way of disposing of it is to burn it without loss of time or change of place; but Professor Brown intimates that owners of stock generally seem quite unaware of the danger of carrying about these infected matters. There is, no doubt, are only some of the ways in which the directions of the local authorities are evaded; and when to this are added the numerous cases in which the local authorities themselves are not properly alive to the danger, or have interests to serve which would be injured by the adoption of the necessary measures, the inferiority of precautions which aim at localizing the disease in the country to precautions which aim at keeping the disease out of the country becomes very plain. We gave an example of the supineness of local authorities some weeks ago, and when inquiries are being instituted into the origin and history of the recent outbreak, it will be well to ascertain why, when reports of the existence of the cattle plague in Hull were freely circulated, and a dairyman in the town had suddenly taken the strangely suspicious step of sending the whole of his stock to the butcher to be slaughtered and sent up to the London market, the local authorities did not take the trouble to make any inquiry into the reports. It rests with the Hull authorities to say whether the disease shall be stamped out at its first appearance in the port, or be spread over all the neighbouring counties.

The recent importation of American beef shows that, given the supply of meat, it is perfectly possible to land it in this country in a saleable condition without bringing the animals over alive. If this can be done where America is the purveyor, it can be done equally well where Holland and Germany are the purveyors. If the importation of living cattle were prohibited except for breeding purposes, the home supply would be protected against a danger from which at present it is never for a moment free, and which it seems impossible to ward off completely by any less drastic measure. But the enterprise which has bridged the Atlantic would certainly not be baffled by the German Ocean. If very fair meat can be sent over dead from the United States, it can equally well be sent from nearer countries. The doubts that exist as to the continuance of the American meat supply relate not to the means employed for bringing it to this country, but to the amount of cattle that will be permanently available, and to the quality of the meat sent over. Neither of these possible difficulties would exist in the case of Continental meat. Its amount and character are known quantities, which would be wholly unaffected by the substitution of slaughter at the Dutch or German port for slaughter at the English butcher's.

PARIS AT EASTER.

NOTHING could well be more striking than the change from the heavy oppression of the London climate last week to the brightness and freshness of the sky under which the Parisians live. The sensation might be compared to that of coming out of a long tunnel or up from the recesses of a dingy mine into the clear air again. Body and mind alike seem revived by the liveliness which, under favourable conditions, appears to be a component part of the

Parisian atmosphere. Such conditions are of course not permanent; and on two days in last week there were thunderstorms in Paris the approach of which made the air as heavy and uncomfortable as it would have been in London. Nor is rain in the abstract any more pleasant there than here; but there is a resource which is wanting in London in the covered arcades of the Palais Royal and the Rue de Rivoli. An affliction far more disagreeable than rain, and for which there is no remedy to be found, is due to the progress of the new street which is to run from the Place du Théâtre Français to the Opera. To attain this desirable end houses are being pulled down and foundations dug amid all that fussiness and exhibition of admirable but misdirected energy which are in France inseparable from any undertaking of the kind. The road is blocked up, so that where carriages formerly went by a straight route to the boulevard they now have to go a long way round. This it would not be difficult, perhaps, to endure with philosophy; but it is less easy to bear unmoved the annoyance caused by the ceaseless procession of lumbering carts loaded with stone and rubbish, and drawn by horses adorned with picturesque, but one would think uncomfortable, sheepskins, which pass to and fro from morning till evening along the most crowded thoroughfares of Paris. The drivers of these carts seem to take an absolute delight in delaying the progress of carriages and foot passengers, and a fine dust from the rubbish contained in the carts floats about in the air and attacks with malignant persistency the noses, eyes, and mouths of all whom it encounters. However, the Parisian temperament is cheerful, and people who live in Paris can no doubt afford to put up with a good deal of inconvenience for the sake of the comfort to be gained when the new street is finished.

Visitors to Paris have been unfortunate in more than one way. The Théâtre Français has been deprived, only it is to be hoped for a time, of Mlle. Sarah Bernhardt, who has been obliged to go to Mentone for her health. It would have been some consolation for the great actress's absence to have seen the revival of Régner's *Le Joueur*, in which M. Delaunay made a great hit in a new line of part. But M. Coquelin, who played one of the most important characters, has been seriously unwell, and, it is feared, may not be able to act again for some little time to come. Under these circumstances the standing entertainments have been the revival of *L'Amphitryon*, which has been successful, and *L'Ami Fritz*, which continues to afford delight to the audiences of boys and girls to whom it is supposed especially to appeal. Indeed, beyond the fact of its being "une pièce honnête," which was its great recommendation to the theatre, it is impossible to discover any but a very mediocre merit in the production so far as its authors are concerned. The puerilities in which the piece abounds seem hardly worthy of the attention given to them by the first theatre of Europe; there is something incongruous in seeing two socialists and a rising pensionnaire of the Comédie Française gravely sitting in a row and swallowing soup in rhythmical measure amid the childish, if innocent, laughter of the audience. And when delight is caused by the patriotic passages scattered through the play, one cannot help remembering with some amusement that, for the express purpose of introducing them, the scene of MM. Eckmann-Chatrian's story has been changed from Bavaria to Alsace, and that the enthusiasm of the characters in the novel is given to "la patrie Allemande." *L'Ami Fritz* himself is a personage in whom it is next to impossible to take any interest. His greediness is unpleasant, and is mixed up with his love, just as that of *Le Conserit* is when he longs at the same moment for a sight of his sweetheart's face and a good bowl of bouillon. The rabbi David Siebel is made interesting by the force of the piercing intellect and skill brought to bear on the character by M. Got, who, while he gives a grotesque and even inhuman aspect to the part, yet contrives to arouse a curious sympathy with it. But in truth the rabbi, who goes about the world trying to make everybody marry and have families, is nothing more than a crazy old idiot, whose discourses, if delivered by any actor inferior to M. Got, would be infallibly tiresome. The one character in the play that is really interesting is Suzel, the peasant girl who wins the heart of the voracious Fritz; and the interest felt in her is due more to the charm of Mlle. Reichenberg's acting than to any attractive quality in the authors' treatment of the part. Mlle. Reichenberg as Suzel abandons her usual lightness and airy grace of manner, and wears an aspect of pretty shyness which is admirably suited to the character. The gradual growth of the unconscious girl's love for Fritz is indicated with rare skill; and the tenderness with which the end of the second act, when the rabbi discovers her secret, is played has a penetrating truth. It is Mlle. Reichenberg who gives to the play the touch of romance and poetic interest in which it is of itself wanting; and it is difficult to imagine that the effect of its representation without either her or M. Got can be anything but terribly dreary. M. Febvre, whose performance of Fritz is clever, but somewhat heavy, and marred as usual by frequent indistinctness of utterance, is going to try the experiment of taking the play through the provinces and to London with a scratch company—an intention which shows a remarkable confidence in his own powers. Minor parts at the Français are well played by MM. Barré and Coquelin cadet, and by Mlle. Jonassain, whose acting in a scene with Fritz in the third act is admirable. The stage management of *L'Ami Fritz* was undertaken by M. Delaunay with the happiest result. There is only one slip to be discovered throughout, and that is that, after Fritz has made a great business of providing a quantity of bottles of fine wine for his guests, six of them are put away on the side-

board, and never so much as mentioned during the very realistic dinner which takes place. At any other theatre such a trifle would no doubt pass unnoticed; but where one is accustomed to look for perfection of arrangement, the smallest blot catches the eye.

An event of special interest to the members of the Comédie Française and their friends, and the interest of which spread to a wider circle, was the wedding of the son of perhaps the most accomplished actor in the company, whose high and generous character has made him as much liked and respected in private life as admired upon the stage. The ceremony was gone through in the church of St. Séverin, and derived an additional interest from the music being volunteered by members of the Opéra Comique company. M. Bouhy, for whom a most successful future has been prophesied by M. Faure, sang very much in that admirable singer's style with most impressive effect. The evening dress assumed by the relations and friends on the occasion of a French Roman Catholic wedding has at first something of an odd and sombre effect to English eyes; but this is of course relieved by the colour and light which are wanting in the Protestant ceremony. When the service is ended, the guests defile past the bride and bridegroom and their parents in the sacristy, expressing their good wishes as they pass—a method which has perhaps some advantages over the confused hand-shaking and embracing which go on upon like occasions in an English vestry.

The success of M. Sardou's *Dora* at the Vaudeville is well deserved both by author and actors. The piece is written in M. Sardou's happiest manner, avoids harping on the well-worn string of illicit relations between men and women, and is strong without being disagreeable. One or two sentences might, it is true, be omitted with advantage, but in the general tone of the piece there is nothing unpleasant. It opens in the room of an hotel at Nice, where the Marchioness de Rio Zares and her daughter Dora are living. They are in the utmost poverty, but manage to keep up appearances and entertain after a fashion; and the various characters of the society they frequent are revealed in an ingenious fashion by Favrolle, one of their acquaintances, an advocate, taking up the cards from their basket in their absence and discussing the owners. Here occurs one of the cleverest lines in the piece; Princess Mariatine, by way of vindicating an acquaintance who has a somewhat mythical husband, says, "Avez-vous jamais vu un mari?" The answer is, "Et vous, princesse?" To which she replies, "Rarement." The Marchioness de Rio Zares, excellently played by Mme. Alexis, who keeps up a strong Spanish accent throughout, has set before her as the object of her life to find an eligible husband for her daughter, who on her side cordially detests the life of scheming which she is forced into keeping up. The first act is ended by her outburst of scorn and anger at dishonourable but magnificent proposals made to her by a certain Stramir. Before this, Tekly, a friend who has got into trouble with the Austrian Government, comes in to bid good-bye to her, saying that he is on his way to Corfu, and gives her a photograph of himself, with an inscription to her on the back. This photograph is presently stolen by the Countess Zicca, the villain of the piece and its least likely character, and upon this theft the action of the play turns. Leaving aside certain political interests which are brought in, we may say that in the second act we find the Marchioness established without her daughter's knowledge as a spy in Austrian pay through the agency of a Baron van der Kraft, who is one of the people whom Favrolle somewhere describes as "des agents désavoués et désavouables." In the same act Dora accepts an offer of marriage from André de Maurillac, a young diplomatist whom she has long loved. In the third act Van der Kraft, alone with Countess Zicca in the room where the wedding party are to assemble when they come from church, tells her that he is anxious to possess a certain draft of a treaty locked up in André's desk. This she manages to steal under such circumstances that suspicion must fall on Dora. While Dora has gone to change her dress and André is talking to Favrolle, Tekly enters, and without knowing to whom André is just married, proceeds to denounce Dora and her mother as spies who have had him arrested and imprisoned in Austria. Here is the one blot in the construction of the piece; it is scarcely credible that André should not at once say to Tekly, "You are speaking of my wife," instead of letting him complete his accusation. This improbability granted, the scene which follows between Tekly, André, and Favrolle is one of thrilling excitement. Tekly is induced, most unwillingly, to bring forward the circumstance of the photograph which was produced as evidence against him, to confirm what he has said, and close upon the blow given to André by this intelligence comes the discovery that the papers have been stolen from his desk, apparently by Dora or her mother. The great point of the act, however, and indeed of the whole play, is the scene between the three men. M. Pierre Berton as André displays a passion and fire which one would not have expected from his performances at the Français; M. Dieudonné represents the friendly devotion tempered by professional calmness of Favrolle which avails to quell the storm with admirable delicacy; and M. Train gives as true and manly pathos to the distress of Tekly, when he finds what he has done, as does M. Pierre Berton to that of André. The rest of the play is taken up with the discovery on Dora's part that her newly-married husband suspects her, with his and her despair, and with the final solving of the mystery. The discovery of the Countess Zicca's guilt by Favrolle is a masterpiece of ingenuity on M. Sardou's part, and it is difficult to conceive the scene of her confession being

better played than it is by M. Dieudonné and Mlle. Bartet, whose performance is full of promise. In Mlle. Pierson's representation of Dora it would be difficult to find a fault. The honest and high nature of the girl, preserved in spite of adverse circumstances, is shown to the spectator with rare judgment and power; the first dawning upon her of the terrible fact that her husband suspects her to be a spy and a thief, and her indignant refusal to defend herself against the charge, are given with remarkable fineness and force, and her falling senseless when he rushes out saying that he will kill himself—an intention which he prudently abandons—has the impress of truth. M. Parade is, as always, excellent after his own fashion as Van der Kraft; and Mlle. Montaland gives much point to the character of the Princess Mariatine, which gains some interest from being known to be a portrait of a real Russian princess resident in Paris. The piece is to be "adapted" for the English stage at the Prince of Wales's Theatre; and if the management can find an adapter who will not spoil it, and three actors who can adequately play the great scene, which under present conditions appears next to impossible, there is no very obvious reason why the experiment should not be at least as successful as M. Fevre's of playing L'Ami Fritz all by himself.

THE DEPRESSION IN THE IRON TRADE.

MR. WATERHOUSE, the accountant to the Board of Arbitration for the North of England Iron Trade, has issued his quarterly return for the three months ending with February last, and the document merits careful attention even from general readers. The iron trade is one of the most important in the country. It gives employment to a vast number of people, the well-being of whose families rises and falls with every fluctuation in the trade. And moreover it is one of the manufactures in which as a nation we are pre-eminent. We have, it is true, to sustain the competition of several rivals, but we continue to maintain a superiority over them. Still, important as the trade is in itself and for the sake of the multitudes whose welfare is bound up with it, the real interest of Mr. Waterhouse's figures lies elsewhere. Iron, in fact, has now become the great instrument of modern industry. It has been said that the civilization of a country is measured by the quantity of iron it uses, and the saying is hardly an exaggeration. Look, for example, at a railway; what is it but a road of iron laid upon an earthen platform? Again, iron is rapidly supplanting wood in the building of ships. A quarter of a century ago a ship was a structure of wood into which iron entered only in the shape of nails, bolts, and screws. Now iron has largely taken the place of wood, and it tends to do so more and more. Lastly, the application of steam is making iron indispensable to every manufacture. Iron, then, is the great instrument of modern industry—a peculiarity which distinguishes the present from all past times; and the condition of the trade is consequently a correct index to the general state of prosperity prevailing.

Considering the universality of the uses to which iron is applied, it is somewhat surprising to find that the condition of the trade is mainly influenced by the degree of activity in railway construction. The fact can be proved beyond the possibility of doubt. The period within which railway extension was most rapidly carried on all over the world was the ten years 1866-75, and more particularly the six years 1868-73. The Civil War in the United States had practically suspended railway-making; in 1861 only 631 miles were made, and even in 1864 only 738. But with the return of peace came the desire to make up for lost time. It was not, however, till 1868 that much activity was displayed. In 1870 5,690 miles were constructed; in 1871, 7,670; and in 1873, 6,167—19,572 miles in three short years. In Germany the successful termination of the Seven Weeks' War had given a fresh impetus to railway construction, which was carried beyond all bounds under the influence of the payment of the French indemnity. In Hungary, again, the compromise of 1867 led to the same result. During the long constitutional struggle with Austria the development of the material resources of the kingdom had been neglected, and in nothing was the neglect more glaring than in the failure to improve the means of communication; when, therefore, the national party triumphed, the first aim of the new Government was to endow Hungary with a complete railway system that would not only connect the several parts of the country with each other, but would also bring them into easy communication with the rest of Europe. Unfortunately, the energy displayed was not guided by judgment. The Cisleithan half of the Empire was less enthusiastic, but it also pushed on the work rapidly. Russia, likewise, having completed the emancipation of the serfs, and suppressed the insurrection in Poland, applied herself to railway-building with redoubled energy. And in India, Italy, France, and even in England, the same work was pushed on, though with more discretion. The result was that in the ten years specified the enormous amount of 45,000 miles was added to the railway systems of North and South America, and 42,000 miles to those of Europe—together 87,000 miles—and by far the larger part of this immense addition was made between 1868 and 1873. The work was done too rapidly. Had it been spread over twice or thrice the time it would have been an unmixed benefit. As it was, it imparted an unhealthy activity to all dependent industries; while the unprecedented demand for iron stimulated the manufacture in every

civilized country. Large capitals were sunk in it, and mines were worked, and new forges built everywhere. The growth of the trade in the United States was marvellous. It was also very great in Germany, Belgium, France, Austria, Spain, and Russia; still the demand far outstripped the supply, and consequently in 1871 prices began to rise rapidly; they continued to go up during 1872, and in the following year were almost double those of 1870. There could be but one ending to this. The demand could not survive such unprecedented dearth; it fell off suddenly and completely, and prices tumbled down even more rapidly than they had gone up. But now a new force came into operation. The railway mania had sunk an amount of capital far in excess of what the world could spare. The countries smitten with it had swept themselves bare of their own movable capital, and had then come to the London market to borrow more. The result was that the capital needed to carry on the world's ordinary trade was seriously encroached upon, and panic ensued. It made itself felt first in Austria; it soon crossed the Atlantic, and afterwards extended to Germany and Russia. Railway construction was brought to a standstill all over the world, and the collapse of the iron trade was complete.

The retrospect we have now taken will enable us to appreciate Mr. Waterhouse's figures. He tells us that the associated firms in connexion with the Board manufactured during the quarter 94,664 tons of iron, at an average price of 6*l.* 18*s.* 3*d.*; whereas in the corresponding quarter of last year the quantity was 114,604 tons, and the average price 7*l.* 6*s.* 5*d.* Although, therefore, the depression in the trade has lasted since the autumn of 1873, that is, about three years and a half, it appears that, in the North of England at any rate, the manufacture is still declining, and even the price falling. It is true that, as compared with the quarter immediately preceding the last, there is a rise of price; but it is very slight, and there is nothing to lead one to suppose that it is the beginning of an upward movement. But the most serious feature in the return is the proof it affords that it is in the railway trade that the decline is going on. Last year the rails manufactured amounted to 38,237 tons, sold at an average price of 6*l.* 14*s.*; but in the quarter ending with February last the quantity was only 7,232 tons, and the average price 6*l.* 2*s.* Thus the quantity manufactured was less than one-fifth of what it was twelve months ago, and the price also had very considerably fallen. Yet it was thought last year that matters were as bad as they well could be; the demand for railway iron was so small that it was believed it must soon increase, were it only to repair lines already in existence. In the North of England, at any rate, this expectation has not been fulfilled. We need hardly say more to show the significance of this almost total stoppage of the rail trade. While it continues no prosperity can be looked for in the iron industry, and accordingly we are not surprised to learn that the masters have given the men notice of a further reduction of wages. Thus the workmen are losing more than they have gained since 1868. But to return. In the corresponding quarter of 1873 the out-turn of rails was about 81,000 tons; in the five years, therefore, it has decreased to less than one-tenth. Fortunately, however, to counteract in some measure the decline in the rail trade, there has been considerable activity in ship-building. The iron plates manufactured have increased from 41,132 tons last year to 51,830 this year; and angles from 13,099 tons to 17,487 tons. It is this increase in the demand for plates and angles for ships that has prevented the return from appearing even more unfavourable than it is. It is to be borne in mind, however, that the figures we have been quoting refer to a single district, which, though it competes with Wales for railway orders, is yet not favourably circumstanced for that special trade. At the low price at which Bessemer steel is now sold, it must be preferred by all Companies which can afford it, and the Northern district manufactures no Bessemer steel. We must not, therefore, conclude too hastily that what is true of the North of England applies equally to the whole country, and that the supply of rails is passing altogether out of English hands. We turn, then, to the Board of Trade Return for March to ascertain whether, during the first three months of the current year, there is observable for the whole of Great Britain a marked falling off in the export of railway iron and steel. We do not find it so. Compared with the first quarter of 1875, indeed, there is a very great decrease; but, in comparison with the first quarter of last year, there is a small increase of quantity, though there is a slight decrease in value. It would seem, therefore, that the causes of the decline in the North of England are special and local.

But while the Board of Trade Returns show no fresh decline in the export of railway iron, neither do they testify to any increase. The depression is as great as it was, and prices even are somewhat lower. This further fall of price is a favourable circumstance, since the extraordinary cheapness must tend to stimulate demand, just as the unprecedented dearth of 1873 destroyed it. But, before the demand can assume larger proportions, the existing apprehensions of war must be allayed. While the present uncertainty prevails no great works on the Continent of Europe can be undertaken. But something more is necessary than the maintenance of peace. Four or five years ago we exported to the United States annually about half a million tons of railway iron; in the last three months we exported barely 792 tons. Before, therefore, the old activity in this trade can be revived, the United States must recover from the effects of the panic of 1873, must restore order in the South, must

carry through resumption, and must inspire confidence in railway management. Confidence is what is wanted more than anything else; and it is wanted, not only in the United States, but as regards all our foreign customers. The former activity in the iron trade was possible because the countries which needed railway extension were able to borrow money in London to pay for the iron they required. But the discredit into which foreign loans have now fallen renders this mode of doing business impracticable. It is certainly not desirable that it should be entirely revived. A prosperous and active iron trade is highly beneficial, but the prosperity and activity of the period immediately preceding 1873 were factitious and unhealthy. The resources of the country were squandered upon foreigners and no return was received. Of course loans to foreign countries and foreign commercial associations, when judiciously made, are legitimate and advantageous. They help to develop the wealth of other countries and to increase their trade with us, while they afford to our saving classes profitable investments. At present, however, the solvent and the insolvent borrowers are confounded in a common suspicion; and trade suffers now from the want of accommodation, as it suffered before from the too great readiness with which it was given. But just yet there is no prospect of a speedy revival of confidence. It is, however, to be noted as a favourable symptom that iron ship-building in the North of England is on the increase.

REVIEWS.

GUILLEMIN'S WORLD OF COMETS.*

THE rapid progress of cometary astronomy consequent on the discovery of the intimate connexion between meteors and comets makes it desirable to take stock of our knowledge of these bodies, and such a work as that of M. Guillemin is therefore highly acceptable to the student of astronomy, as well as, from its popular style, interesting to a larger class of readers. Indeed M. Guillemin appears fairly to have hit the happy mean between the didactic and the entertaining, and thus manages to convey a considerable amount of accurate information in an attractive form. Though several of his chapters are somewhat discursive, they are perhaps desirable as a concession to those readers, ever too numerous, who require to be coaxed into accepting anything scientific, and the general plan of the book seems certainly well calculated to awaken an interest even in the most careless reader. In discussing M. Guillemin's treatment of the subject, however, we may well pass over the parts of his work which deal with popular superstitions about comets, and consider rather the account he gives of the present state of our knowledge. The first great step in the theory of comets was made by Newton, who showed that these bodies, irregular though their motions seem, circulate round the sun in obedience to the same laws that govern the movements of the planets; with the important distinction, however, that their paths are in general so elongated as to be practically undistinguishable from the curve known as a parabola—a condition which, if rigorously fulfilled, would imply that they never return to the sun again. Newton however held that this was only an approximation to the true state of the case, and that comets really move in elliptic orbits, returning to the neighbourhood of the sun after the lapse of many years or even centuries. By this theory comets were at once removed from the class of atmospheric phenomena—a step the importance of which may be seen when it is considered that it is only within the last ten years that meteors, which are presumably the constituent particles of comets, have been shown to be members of the solar system. But a still greater advance was made by Halley in pointing out that the comet which now bears his name had actually been observed at three successive returns in 1531, 1607, and 1682, from which he inferred that it moved round the sun in about seventy-six years, and that it would be seen again in 1758. Halley himself did not live to see his prediction fulfilled; but the interest felt in it as the time drew near led Clairaut and Lalande to undertake the laborious task of computing the disturbing effect of the planets Jupiter and Saturn, near which the comet would pass, and by the action of which it was delayed in its course more than six hundred days. The exactness with which the return of the comet was thus computed must be considered one of the greatest triumphs of the Newtonian theory; and the next appearance, in 1835, furnished even more conclusive proof that these bodies are strictly subject to the law of gravitation.

Amongst the periodical comets which have, since Halley's time, been enrolled in the solar system there is, however, one which seems to show the action of some other force, modifying to a small extent its motion. This comet moves round the sun in about three years and a quarter, and its motions have been very carefully studied by Encke, by whose name it is known. Since it was first observed, in 1786, it has completed thirty-two revolutions, in the course of which, according to Encke's calculations, its period has been gradually growing shorter and shorter—a result of the contraction of its orbit. This effect the German astronomer attributes to the action of a resisting medium, which, in the immediate neigh-

* *The World of Comets.* By Amédée Guillemin. Translated and Edited by James Glaisher, F.R.S. London: Sampson Low, Marston, & Co. 1877.

bourhood of the sun, might have sufficient density to impede the motion of such a rarefied body as a comet without sensibly affecting the dense planets. Encke's comet would be peculiarly subject to such an influence, as it approaches the sun more closely than any other periodical comet, its least distance being nearly the same as that of Mercury. Since M. Guillemin's book was written some additional light has been thrown on the matter by M. von Asten, who has found that the comet must have experienced some shock in the year 1869, possibly by collision with one of the asteroids, which delayed its next return. With this exception, its motion is perfectly accounted for by the hypothesis of a resisting medium; and though M. Guillemin quotes M. Faye's objection that such an atmosphere, extending to a considerable distance from the sun, must necessarily circulate in the same direction as the planets, and would therefore affect in a much more marked degree a comet such as Halley's, which moves in the opposite direction, a good deal of the force of this objection is lost when the much closer approach of Encke's comet to the sun is taken into account. This question of the motion of Encke's comet in connexion with the hypothesis of a resisting medium is perhaps one of the most important in physical astronomy, and it might well be treated at more length in a future edition of M. Guillemin's work.

Passing by the accounts given of various comets, interesting though they are, we come to the discovery of the connexion between meteors and comets, the next great step in the progress of this branch of astronomy, and one which opens up new ideas not only of the nature of comets, but of the more general question as to the constitution of the solar system. The first advance in this direction was made by M. Hoek, who, from a careful analysis of all known cometary orbits, was led to the conclusion that these bodies form systems, each member of which pursues nearly the same path. A very small difference in the initial velocity, such as might result from an explosion, would be sufficient to cause a wide separation as the system approached our sun; and thus M. Hoek is able to refer certain comets which visited us two or even three hundred years ago to the same origin as some which have been observed in quite recent years. According to this idea every star has its own cometary system, which may, by a slight disturbance, be detached from its proper primary, and, after journeying for some time through space, come within the sphere of the influence of our sun. Though the bearing of this theory on the relation of meteor-streams to comets is not immediately apparent, it will be seen, on further consideration, to be of importance as showing that bodies which were moving in the same path, but separated by a wide interval when near the sun, may in far distant space have been so close together as really to form one mass. Now M. Schiaparelli has pointed out that several well-marked meteor-swarms are travelling along the same orbits as certain comets, and the identity of these two classes of bodies seems therefore to follow naturally enough from M. Hoek's investigations. In fact, a globular mass of meteors journeying through space would, on coming into the neighbourhood of the sun, spread out into a ring by virtue of the great increase of velocity in that part of the orbit, an increase which would affect the foremost particles first, leaving the others to lag more and more behind. In this way a meteor-swarm would form a portion of a ring which might take many years to pass the point where it meets the earth's orbit, and showers of shooting stars would be seen on the same day year after year. The great display of meteors in November 1866, recurring after intervals of some thirty-three years, first gave rise to these speculations, the way having been prepared by the discovery of a number of radiant points, from each of which meteors moving in a common direction appeared to spring. More than seven hundred such systems have now been tabulated, though only four of the most conspicuous appear to be accompanied by comets, as far as our present knowledge goes. The August meteors, in particular, which have recurred regularly for many years past, appear to be the outliers of the great comet of 1862. The most startling discovery was, however, made in connexion with Biela's periodical comet, and the meteors of November 27. This comet, after splitting into two distinct bodies some thirty years ago, was only seen once more; but, in place of the expected appearance of the comet in 1872, a remarkable shower of meteors occurred, which suggested the idea of a collision with the comet, and led to a search for the missing body in the direction in which the meteors were moving. Mr. Pogson, at Madras, actually found a comet near the place indicated, but it is not clear what the connexion of this body with the meteor-swarm really was, only two observations having been obtained. To M. Guillemin's account of these events, Mr. Glaisher, as editor, has added many interesting particulars, one point in particular to which he calls attention being that, from the known distance of the comet from the earth on the occasions of two great star-showers (in 1838 and 1872) the meteor-swarm must occupy an arc of at least five hundred millions of miles, a very remarkable conclusion considering that this length corresponds to about one-third of the whole orbit. It is worthy of remark that much alarm was caused in 1832 by the possibility of a collision with Biela's comet, though, as a matter of fact, the earth was some fifty millions of miles distant from the point where the two orbits approach most closely; but forty years later something very like the dreaded event appears to have occurred without our being conscious of anything more unusual than a fine display of shooting stars. Amongst the instances given by M. Guillemin in which comets have passed near the earth, the most remarkable is that of the great comet of 1861, through the tail of which we seem actually to have passed, the only result, if any, being an

unusual phosphorescence in the sky, which was remarked by one or two observers. In consequence of its proximity to us, the tail of this comet appeared of enormous length, extending over two-thirds of the heavens; but a reference to the useful table of real and apparent lengths of these appendages which M. Guillemin gives shows that the tail of the comet of 1861 was not really so remarkable as it appeared, and that in fact it was surpassed in actual size by many others, including Donati's comet of 1858. M. Guillemin has given some interesting particulars of the relative dimensions of the tails of comets as well as of their heads and nuclei, and of the changes which they have undergone in several instances, and has brought together a variety of useful statistics respecting cometary orbits, to which we can only thus briefly refer.

We must not, however, pass over Professor Tait's theory of the constitution of comets, quoted by Mr. Glaisher, which, amongst all the various hypotheses analysed by M. Guillemin, appears most in harmony with recent discoveries. Professor Tait starts with the idea that a comet is nothing but a group of meteoric stones, and accounts for the phosphorescence of the head and the emission of jets of luminous particles by the simple hypothesis of collisions among the constituents. On this theory the tail is simply a portion of the less dense part of the train of meteors illuminated by sunlight. Though many phenomena are thus easily explained, there is much left to be accounted for; and, while we hesitate about accepting any hypothesis yet put forward, we may console ourselves with the belief that observation and experiment will very soon explain the mode of formation of a comet and its strange appendages out of a swarm of meteors. A great advance in this direction (though not noticed by either M. Guillemin or Mr. Glaisher) has been made quite recently by Professor A. W. Wright of Yale College, by a spectroscopic analysis of the gases given off by various specimens of meteoric stones. Under the influence of moderate heat a meteor will give off three or four times its own volume of gas, chiefly carbonic dioxide, and the spectrum thus obtained appears to be exactly similar to that given by comets, leading to the inference that, under the influence of the sun's heat, enormous volumes of rarefied gas are evolved from the meteor-swarm which constitutes the nucleus, and that this incandescent gas forms the nebulousity, afterwards cooling down and spreading out into the tail.

From the sketch we have given, it will be seen that some of the most interesting problems of astronomical physics are rapidly approaching their solution, and that a great insight into these questions may be gained from M. Guillemin's work, which has received some important additions at the hands of its English translator and editor. The illustrations which are profusely scattered through the book contribute largely to its attractiveness, and at the same time really increase its usefulness, as they are for the most part reproductions of original drawings by various observers, and not mere sensational designs.

DIANA, LADY LYLE.*

MR. RUSKIN has spoken more than once, if we are not mistaken, of a certain sculpture in the South Kensington Museum to which he attaches a peculiar value. The work of art represents, in black and white marble, a black and white Newfoundland dog, and the critic looks on it as a thing entirely and ideally bad. It is useful to have such a piece to refer to, and the reviewer of novels now possesses in *Diana, Lady Lyle*, a standard no less ideal than the dog in South Kensington. We are seriously of opinion that *Diana, Lady Lyle*, has not one single redeeming quality. It is not innumeral, we willingly grant, and we have observed no grammatical blunders in it; but a work of fiction may reach undreamed-of excellence in the wrong direction without offending the moral law or the rules of grammar. The style is one long and exquisitely varied torture. The plot is an organized nightmare. The characters are unlike any human beings who ever lived. The absence of humour becomes a positive quality, a darkness that may be felt, while the efforts at fun are merely monotonous repetitions of some imbecile trick of one or other of the characters. Thus there is a groom who invariably says "All serene," and hums a tune about a "bob-tailed nag," while there is a Lord St. Leger who crows like a cock on every occasion. But these things are mere trifles in the immense sum of annoyance which this book inflicts. To attempt to analyse the plot is to try to tell the story of a feverish dream; but the effort must be made.

Leonard Lyle was the son of a baronet, and his mother was the daughter of a duke. This is a fact which the reader is never allowed to forget, and the purity of Leonard's blood is dwelt on with tedious iteration. He was descended from Edward I., from a certain "silver knight" who fought at Ascalon, and from a great many other distinguished people, about whom he is constantly bragging. It is a curious thing that writers of novels which appeal to readers not deeply versed in heraldry are so fond of Norman blood and so contemptuous of the great middle class in whom they find a lenient public. The pictures of the noble society of Yorkshire are on a level in point of refinement with those which Mr. Warren drew of dukes and "the quality" generally in *Ten Thousand a Year*. When we are introduced to the noble Leonard Lyle he is travelling in America, and is being hospitably entertained by

* *Diana, Lady Lyle*. By W. Hepworth Dixon. 3 vols. London: Hurst & Blackett. 1877

Senator Randolph, of Riverside, Virginia. The Senator has a daughter, Diana, a fair beauty, whom Leonard now speaks of as a Saxon and now as a Grecian Hebe. For the understanding of the tale it is necessary to state the genealogy of Miss Diana Randolph:—

Some sixty years ago a Sicilian Prince, the Conte di Capri, of the reigning house, arrived in Virginia, and was entertained at Riverside with the hospitality then in vogue, a fashion which the planters had openly borrowed from Black Knob and the Indian wigwams. When the Bourbon gentleman went his way, he left a daughter not yet born.

This daughter had issue Sally Crump, by a black admirer, and after being emancipated had another daughter by Edward Wingfield, the head of whose family was an earl. Senator Randolph secretly married this woman, a most accomplished person, who read Italian poetry and was always talking about the Arch of Constantine. Their daughter, again, was that Grecian Hebe, Diana Randolph. Diana had a cousin, the child by her father's brother of the elder daughter of Sally Crump, and this cousin Tab, generally called "lying scum," is the evil genius of the story. As, according to Leonard, in one of his blank verses, "the blood of Randolph is the blood of kings," and as the Virginian family numbered Pocahontas in their line, it is clear that Diana's strain was a peculiar one, and in some respects scarcely worthy of the wife of the son of a daughter of a duke. We may now turn to the description of a riding party in which Diana, the Senator, and Leonard give an early example of Mr. Hepworth Dixon's "lithic and sinewy" style:—

"Don't put me off, naughty man!" pouts the girl. "Tell me, in very truth, whether the sun shines brighter in Yorkshire than in Virginia?"

"Yes, the sun that beams from both."

"I mean for very sure. Is sun-shine brighter in Yorkshire? I do not tell you."

"Di-Di!" frowns the curly head, but with a shade so slight that you might take reproof for a caressing smile.

"Don't quote me verses. I do not soon believe in Tab. Tell me, is it true? Are the hills higher, the woods redder, the rannel merrier, in the old country than in the new?"

"Cushy, you can never see a joke!"

"Can't I? Me-a-my! not when Pomp gives Tab a poke, and sets her giggling for an hour? Try me. Did I roar, naughty man, last night when Mr. Lyle's servant wrestled with Pomp and the two other negro lads, and set them rolling in a heap? Tears came into my eyes."

When other and less lithic masters of style would say that a person remarked, or replied, or what not, Mr. Dixon makes his people smack, stamp, snap, frown, and even rebound, which gives great variety of interest. Leonard and Diana, the young lady who roars, to return to the story, fall more or less in love with each other. The former has a fight with the overseer of the negroes a Dutchman named Simon Slokk, who draws a knife on him, and as a great deal of bad language. When Leonard left to reside the Senator accompanied him to Richmond, intending to deposit with his lawyer the proofs of his marriage to the gifted invalid the mother of Diana. Some obstacle prevented him from performing this duty, which an unworthy shyness had induced him to neglect, and on his way home Slokk killed him, by rolling a stone from a height, and robbed him of his papers. The heir, George Randolph, the father of "Tab," turned Diana and her mother out among the slaves, and the invalid died, after explaining to her daughter the family genealogy. Diana was rescued and carried away to a house on the Canadian frontier by a Colonel Cridge, who talks somewhat in the style of a Puritan out of an historical novel. Cridge's sister learned Diana's story, did not believe in her legitimacy, and extracted a pledge from her "never to raise a doubt as to her mother's birth." The war breaks out, and Diana, who has been making money by her skill as a painter, goes to live with a family in Canada who are connected with Leonard's grandfather, the Duke of Doncaster. In their company she visits England, and meets Leonard, who is now a baronet, and is much struck with her eyes being "old Lyle blue," which is spoken of like "old Nankin," or "Prussian blue," or any other recognized substance of commerce. Diana completes her conquest of his heart by making an after dinner speech of great eloquence, a "picturesque discourse on the South, a stirring, florid, and emotional harangue," which she describes as "coming out of her like a hot wind." The wedding breakfast was given at Doncaster House.

Mr. Hepworth Dixon's novel not only covers many hundred pages, but extends over a space of ten years from 1860 to 1870. It is unnecessary to follow Leonard and his bride to India, whence Leonard was sent on an expedition to Yarcand, in pursuit of a frontier policy as mysterious as that of Lord Lytton. On his way home he did deeds of valour on the bodies of a refractory set of Chinese convicts, and he was rewarded with the Victoria Cross, and was a colonel at twenty-six. His wife had been making herself unhappy about the secret of her birth, for Leonard had asked no questions, and was likely to be hurt if the common notion that his Saxon Hebe was the illegitimate offspring of a slave reached his ears. The evil day was deferred by a yachting cruise in the seas of the Southern Cross and other constellations. Diana was taken home by way of Italy, where she saw at last her favourite Arch of Constantine. Still she was not happy, for her late father's lawyers in America treated her demands for the papers proving her legitimacy—papers which they had never heard of—with scorn and insolence. The unsuspecting husband took her home to Castle Lyle, where a very extraordinary deputation, partly dressed in hunting costume, requested him to stand for the county. Leonard's speech on that occasion deserves to be reproduced, as it is not usual to address deputations in broken blank verse:—

We are all Conservatives at Castle Lyle. What do we mean by that?

We mean that we are English born, and hold our birthright as the noblest gift on earth. (Hooray!) England is our native land. We found her great, and mean to leave her no less great; we found her free, and mean to leave her no less free; we found her safe, and mean to leave her no less safe. (Hooray! And so we will!) If any insolent and cunning knave, whether cowed by craven heart, or bribed to treachery by foreign gold, should try to shear her greatness by one rod, should tamper with her freedom by one line, should peril her security by one jot—that insolent and cunning knave will find one enemy the more in Leonard Lyle.

There was a serpent, or rather there were two serpents, in this Tory Eden. Tab and Simon Slokk, in the course of a career of swindling, had reached Yorkshire, and Simon was in need of a baronet and county member to act as a director of the "Mixed Felicity Company," of which it was the object to marry all the black men to white women. In pursuit of a plan which ought to interest the author of *Spiritual Wives*, Simon and Tab encountered Leonard and Diana, and Tab reviled Lady Lyle, in presence of the "sea dogs," as the crew of the yacht are always styled. "Lash out, Di, in thy triumphant scorn!" pleads Leonard; but Di does not lash out. She faints, and though Leonard lodges Simon in the castle vault, and locks up Tab in the family chapel, he cannot help feeling that there is something that the daughter of a duke would not like in the pedigree of his wife. After long consideration nothing better occurs to him than to get a deed of separation from his wife, pretend that he has deserted her, so that she may walk "crowned with the aureole of an injured saint," and silence Tab and Simon by carrying them up and down the world in his yacht. It is not necessary to observe that Simon would have seized this chance to soil the proofs of Diana's legitimacy which he carried with him. He acts, however, with the irrational absurdity of all the other characters of Diana, who keeps her knowledge to herself, and of Leonard, whose actions are no more those of a responsible being than his language is that of a Yorkshire baronet. On board the yacht he makes the discovery "that this lump of earth" (Simon) "must have these family papers on his person." This happy invention occurs on p. 256 of the third volume of *Diana, Lady Lyle*. A cursory glance at the remaining ninety pages shows that the crew of the yacht are still called sea dogs, and that Lord St. Leger is still saying cock-a-doodle-doo, while all must have gone well with Diana, for she still wears, as in her Virginian home,

A golden fillet round her tawny hair.

It is not necessary to comment on the taste which has chosen to make the most scandalous feature of an unfortunate society so prominent in a novel. None of the writers of the *Uncle Tom* school of fiction have drawn, to our knowledge, a more unpleasant picture of Southern life than that which Mr. Hepworth Dixon presents in this story. We have not space to print even an anthology of the absurdities of his style. Here is an unrhymed lyrical snatch which the author has recklessly spoiled by putting a fragment of prose between the first line and the second:—

Woman is weak, and man is strong,

My task is nearly done,
She's coming round, she will awake,
She must not find me here.

Blank verse is used with profusion; here is an example:—

You filled me with the stiffness of my race.
To you I was the meekest of all neck
And lowly things, but when you cast me out
I am again my father's child. We two
Are equal now. Who taught me that the blood
Of Randolph was the blood of kings?

"Talent considers and reflects; Genius goes in at once," says one of Mr. Dixon's characters, and, looked at in the light of this criticism, *Diana, Lady Lyle*, is a work rather of genius than of talent. Mr. Ruskin's ideal work of art appeals to a large number of persons who would not care for the Elgin marbles, and in the same way *Diana, Lady Lyle*, is likely to obtain a wide popularity. Critics who deal with historical writings may therefore hope that Mr. Hepworth Dixon will for the future devote part of his time and genius to the composition of works of fiction.

AFRICA AND THE BRUSSELS CONFERENCE.*

EMILE BANNING, a zealous member of the Geographical Conference which lately assembled at Brussels to promote travel and suppress the slave-trade in Africa, has given an account of the labours and purposes of the meeting in a volume which has the attractions of being small, well written, and well arranged. The English translator has done his duty with assiduity and success, and it would not be easy to find any work on Africa in which so much that is worth reading is to be found in so small a compass. This volume gives its readers, what for the most part they greatly need, an idea of Africa and African travel as a whole. It tells us briefly where travellers have been and where they have not been, and describes the directions in which future efforts will probably be directed. As a rule, books of African travels are very dull reading. The names are uncouth, the people visited are barbarous, and the adventurers are always moving with much courage and through many difficulties from one place that we

* *Africa and the Brussels Geographical Conference.* By Emile Banning, Member of the Conference. Translated by Richard Henry Major, F.S.A. London: Sampson Low & Co. 1877

cannot pronounce to another. The stories, too, are almost always the same, and we get weary of the perfidy of savages and the exchange of useless beads for indifferent food. It is an additional drawback to our enjoyment that the ordinary knowledge of African geography is such that we are seldom sure within a thousand miles where the traveller is supposed to be going. He is always finding a watershed, fording a river, or sketching a negress; but it is difficult to understand in what particular spot his acuteness, his perseverance, or his talents are being exercised. M. Banning's little book may therefore form a very useful guide or aid to larger works. For he seems to have felt the sense of uncertainty and vagueness which others have had to lament, and before he speaks of the Conference he gives a general sketch of the field where it is to work. This is very useful, and M. Banning's preliminary description of Africa is remarkably clear and interesting. It is attended, indeed, with but one drawback. The description is accompanied by a map without which it could scarcely be intelligible; but unfortunately the book and its map have not that degree of intimate correspondence with each other which readers naturally desire. The names of places mentioned in the book are very frequently not in the map; and the names of places in the map are very frequently not mentioned in the book. This divergence of purpose between the maker of the book and the maker of the map will, it may be hoped, be rectified if the book reaches, as it deserves to reach, a second edition.

Of the sea-coasts of Africa most persons have a notion which, though hazy, is not perhaps insufficient. They are more or less acquainted with the names of the Mahometan provinces which, with the interval of Algeria, fringe the Mediterranean. They are aware that French, English, and Portuguese settlements line the Atlantic coast. The prosperity of the Cape colonies is a matter of interest, and their troubles are a matter of anxiety, to many Englishmen; and Zanzibar and Abyssinia are points of the Eastern coast on which the mind can rest without a sense of utter ignorance. But it is very different with the vast interior, which, as we look at it on the map, seems a hopeless maze, until we have obtained the clue which permits us to thread its intricacies with a persuasion that we are on the right road. This clue is to be found in the enormous lake to which Speke gave the name of the Victoria Nyanza. From this lake runs, with a course of more than 2,000 miles, the White Nile to the northwards. At Khartoum the White Nile is joined by the Blue Nile, and from Khartoum there stretches westward to the Atlantic a line of negro States, if such a word can be used for the rude assemblages of black tribes. Above this line lies the great desert, and below it is the one region which is as yet totally unknown. Below the great Lake the Zambesi runs to the Indian Ocean, and the Congo to the Atlantic, and African travellers may be roughly described as doing according to their fancy one of four things. They are tracing the course of the Nile, or penetrating into the States to the west of Khartoum, or exploring the Zambesi, or exploring the Congo. Speke, Grant, Captain Burton, and Sir Samuel Baker have made almost the whole course of the Nile known to us. French and German explorers have principally turned their attention to the States west of Khartoum. Livingstone has for ever associated his name with that of the Zambesi, and Lieutenant Cameron has crossed the continent from the mouth of the Zambesi on the east to the mouth of the Congo on the west. The vast area of Central Africa is tenanted by negroes whose total numbers are computed at a hundred and fifty millions. These millions may, however, be separated into two divisions. There are the blacker Soudan negroes and the paler Kafir negroes; and, if a line is drawn from Senegal, where the line of the States going west from Khartoum ends in the Atlantic, to the Victoria Nyanza and Zanzibar, it may be roughly said that north of this line the negroes are very black and are Mahometans, and that south of this line the negroes are not so very black, and are pagans. It appears to be easier to imbue pagans than Mussulmans with civilization and Christianity; and it is for this reason that the attention of philanthropists is mainly directed to the region south of the Victoria Nyanza—that is, to the districts watered by the Zambesi and the Congo. It is in this direction that the Brussels Conference will, primarily at least, direct its efforts, making better known what is now imperfectly known of this area, and endeavouring to push discovery into that vast tract north of the Congo in which the foot of civilized man has never yet been planted.

Some readers will no doubt ask themselves why, after all, civilized man should go to Central Africa, and the pages of M. Banning will supply them with an answer, although it is not perhaps the answer which he appears to give. So far as science goes, there can be no question. It is desirable for innumerable reasons that the whole configuration of the globe should be known, that the flora and fauna of Africa should be understood, and that the physical and moral peculiarities of every branch of the human family should be investigated. But those who are enthusiastic in behalf of Central Africa are far from limiting themselves to the advocacy of the claims of science. They put forward reasons of a very different kind. In the first place, they urge that Central Africa offers a great field for European commerce. M. Banning takes this view, and says what he can to support it. But his reasons do not seem to carry us very far. At present Africa produces two articles of commerce, and two only—ivory and slaves. The supply of ivory is running short, and the sooner the supply of slaves runs short the better. If philanthropy triumphed and elephants were killed off a very little more rapidly than now, Central

Africa would have no exports at all. It is not easy to understand what there is in Central Africa that could be exported. No doubt the negroes grow maize and other cereals, but then they eat them. Then again it is highly probable that, as M. Banning says, coffee, and sugar, and wine might be grown in many places. But the difficulty which the world has at present to encounter is, not to find places where nature would permit coffee, and sugar, and wine to be grown, but to find places where these articles can be grown at a profit when all the elements of price, such as the cost of labour and of transport, are taken into consideration. There are thousands of places in the world where adventurous man might better expect to make money than if he went to the districts of the Zambesi and the Congo. In the next place, M. Banning, to speak of no one else, positively tries to persuade us that it is wise to go to Central Africa because Central Africa is such a very nice place to go to. This is a little too much. It seems, after reading his book, that Central Africa is as dismal a place inhabited by as dismal a set of people as can be found on earth. That here and there magnificent scenery is to be met with may be very true. If a continent 4,500 miles broad, and as many long, did not contain a few bits of fine scenery, it would be a very poor kind of continent indeed. But, as a rule, the scenery is the reverse of fine, and life appears to be mostly carried on under great disadvantages. M. Banning is too obviously an optimist to be persuasive. He tells us of delightful places which have only one drawback, that of a pestilent miasma, as if a delightful place wanted any more drawbacks when it had got such a fine one to begin with. Then, in his exultation over the variety and extent of African animals, he quietly tells us that "serpents abound," as though serpents were like homo-fed lambs, and the more we had of our pets the happier we should be. The real and the sole motive to go to Central Africa, apart from science or sport, is the wish to do good. There is the legitimate and laudable desire to make at least the paler negroes Christians, after such a type as they are qualified to reach, and there is the desire, which deserves every praise that can be given to it, to stop the slave-trade. It is the latter feeling that prompts the activity of the Brussels Conference, and the curse of the slave-trade is so great, the crimes it prompts are so awful, and the horrors it engenders are so appalling, that it may be safely said that to suppress the African slave-trade would be to render a service to mankind more certain and more extensive than any other at which those who feel for suffering humanity could aim.

There are three centres of the slave-trade in Africa at present. First, there are the Mahometan States stretching from Khartoum towards Senegal. Here the Mahometan rulers find pagan tribes interspersed or adjacent, and making raids on them, send off batches of slaves through the great desert due north to Fezzan, whence the slaves are sent, according to M. Banning, eastwards across the Libyan desert to Cairo. The number of slaves reaching Cairo annually is calculated at 10,000. Secondly, there is the valley of the White Nile, whence 30,000 slaves are sent annually to Massowah. Lastly, there are the territories south of the Victoria Nyanza, whence 40,000 slaves are sent annually, since the outlet of Zanzibar has been closed, to two ports, one north and one south of Zanzibar. For one slave that reaches his destination, five, it is calculated, are taken from their homes, and so the total numbers would reach in each year 400,000. Some authorities, however, place the total much higher, and one authority, whom M. Banning quotes without any expression of disapproval, puts the total number of men carried off at a million. The area from which the slaves are drawn contains, it is said, eighty millions of negroes. If a million are carried off every year, and those carried off are, as it is said, men, then, as the number of men in a population cannot be taken at more than a fourth of the whole, it follows that, out of twenty millions, one million is carried off every year. Such a result may make us somewhat sceptical as to M. Banning's figures, but any doubt as to details need not infect us with suspicion as to the plain general result. There can be no uncertainty as to the main point. Enormous suffering is every year caused by the slave-trade. There is no misery inflicted on the whole earth at all equal to that caused by the African slave-trade; and, if philanthropy has any meaning, it ought to try to stop this wicked system. On the West coast of Africa the slave-trade has ceased, because the countries which used to take slaves there have ceased to take them. On the Eastern coast of Africa the slave-trade flourishes, because there is a ready market for slaves in Mahometan Asia. English cruisers do something to put down the trade; but they cannot do much when there is a market so near and so profitable. What then is to be done to stop the African slave-trade? As to two of the routes of the trade, as they terminate in Egypt, the Conference seems to be of opinion that the best and simplest plan is to press the Viceroy of Egypt to fulfil his repeated promises, and put an end to the traffic carried on in his dominions. The Southern district, that which provides slaves from the shores of the Victoria Nyanza and the adjacent lakes to the South and South-west, remains as the real field for the operations of the Conference. It is in the regions watered by the Zambesi and the upper tributaries of the Congo that the Conference proposes to show how effectually it can carry on the work which it has assigned to itself. The basis of its plans appears to be the establishment of stations in which a few energetic white men will permanently dwell to serve as a centre of civilization, an encouragement to travellers, and an obstacle to slave-dealers. The chapters in which M. Banning describes the proposals of the Conference are, however, the least satisfactory

part of his work. He soars too much into the vague grandeur of philanthropy, and, so far as he gives details of the scheme, they seem sadly disproportionate to the great aim to be attained. Recent intelligence, however, seems to indicate that the Conference is likely to have at its command a machinery much more efficacious than that which M. Banning ventured to anticipate; and if a serious effort on a sufficient scale is really made, those who make it will deserve, and will no doubt receive, the sympathy and admiration of the civilized world.

BE DOMES DÆGE.*

IT seems that the Early English Text Society is beset by complaints on two sides. One party asks for more early works to illustrate language; another for more later works to illustrate other things besides language. Each demand is alike reasonable in itself; but certainly the demand for things which illustrate language is that which seems to come most naturally within the range of an Early English Text Society. It seems that there are some who complain that the earlier and harder texts, though of extreme interest in point of language, are, with rare exceptions, theological and dull. They ask for "romance and adventure, social life and fun." And the Committee answer, with great truth, that "inedited manuscripts containing matter of that kind are rare indeed, and grow rarer year by year." So each party is very reasonably asked to deal charitably with the other; those who seek for the romance and adventure, to say nothing of the social life and fun, are asked to bear with the earlier writings in which the philologist delights, but whose matter is said to be theological and dull. It is certain that the oldest form of the language does contain, at all events in the form of *Beowulf*, a good deal of stirring romance and adventure. But then *Beowulf* certainly cannot be called an inedited manuscript. We rather stand appalled as we see a whole menagerie of printed *Beowulfs* gathered together on our shelves. Still it must be confessed that a vast proportion, edited and inedited, of what remains to us in the earliest form of the English tongue is undoubtedly theological, and if theology implies dullness, it is therefore undoubtedly dull. For our own part we are not sure that everything that is theological need be dull. Chaucer is theological, yet surely he is not dull. And a good deal which perhaps might be dull in a modern shape—dull, that is, so far as we have often heard the matter of it before—ceases to be altogether dull when we get it in a very early form of our own, or of any other language. A philological interest there is always, and there is something besides the philological interest. There is something besides any interest and any instruction which is to be got from the mere forms of words. There is an interest, whether we are to call it historical or philological or theological, about the form of the whole thing, as distinguished alike from the matter and from the forms of the particular words. A hymn, a prayer, a song, a writing of any kind, of the matter of which we should make little account if it were written yesterday, does impress us when it comes in the guise of any language in its earlier shape. Whether there really is or is not, there always seems to be more depth and power and earnestness in the ancient writing than in the modern. Most likely there really is. The subjects were fresher; the same tale had not been told, the same picture had not been drawn, the same exhortation had not been given, so often then as it has now. But to have this effect the writing must be in the writer's own tongue. Merely as a statement of fact, we are always inclined to believe a thing written in a man's own tongue—in Old-English, in Old-German, or in Old-French—rather than what is written in contemporary Latin. It is an instinct, and it is something more than an instinct. We believe that men really were more earnest and more truthful when they wrote in their own tongues. There was not the same temptation to show off their own scholarship; there was not the same temptation to be tricking everything out with an *issimus*. We are not sure that the result is dullness; in secular matters we are sure that an English writ, say of the tenth century, which goes straight to the point and has not a word more than is needed for the business in hand, is much less dull than its contemporary Latin fellow, which runs on through two or three pages of big words about nothing in particular. So with theological matters; a Latin sermon is undoubtedly grievous; a Latin religious poem must have some intrinsic merit to be otherwise; but, let it be Old-English, or Old anything else, and it has an interest besides the purely philological interest. It has the interest of giving us a man's real words and thoughts, as they came naturally to him in ages long past. We do not think that all theological writings are necessarily dull. We do not think that the theological pieces now edited by Mr. Lumby are dull. Yet possibly, if we came across exactly the same matter in a modern hymn or a modern sermon, we might think it dull.

Mr. Lumby here gives us five Old-English poems, of which the first two, including the longest which gives its name to the volume, have never been printed in full before. The other three have been printed by Grein. But Mr. Lumby has printed them all, as they are all found in a single manuscript in the library of Corpus Christi College, Cambridge. The first and longest piece,

headed "*Be Domes Dæge*," is a translation of the Latin poem on the same subject which has been sometimes attributed to Bede and sometimes to Ealhwin. To this Mr. Lumby has added the Latin text as it stands in Migne. After the translation there comes in the manuscript a piece of eighty verses, somewhat in the nature of a sermon, which seems to have no name, but which Mr. Lumby heads "*Lār*" (=Lore). These two are those which have not before been printed. Then come thirty-one lines of an "*Oratio Poetica*," in which all the lines but two are what on a less grave subject would be called macaronic; that is, each line is half English and half Latin. The other two are poetical paraphrases of the Lord's Prayer and the Doxology.

The first piece then is a translation, and it is a vigorous translation, of a vigorous original. There is a life both in the Latin and in the English which we do not always find in later writings on the same subject. The Latin rather belongs to the very latest classical—perhaps not the very latest, for it is certainly clearer and simpler than the very latest classical type—rather than to a strictly mediæval type. The English has all the vigour of our ancient tongue, though, as usual, the poetic language is a good way removed from the language of contemporary prose. The way in which our forefathers translated, whenever they could, even the technical terms of theology comes out in more than one place. Here is the description of the penitent thief on the cross:—

he drihtene swa þeah: deaðe gehende
his beana behead: breostgelugdum
he mid lýt wordum: ac geþallfultum
his hæle begaet: and help secene
and in-gefor: þa ænlican gearu
neorxnawonges: mid nerigende

This last line illustrates some of the greatest changes which our tongue has undergone. In modern English a specially Teutonic style commonly means a specially monosyllabic style. The ten low words which Pope spoke of as creeping in one dull line have ceased to be necessarily thought low, or the line which they form to be thought dull; but that a style specially English should be one specially monosyllabic comes of our losing our inflexions and our losing our power of forming compound words. Also it illustrates the difference between poetic and prosaic language in the oldest English. One might have the *Chronicles* by heart from one end to the other without meeting anything at all like

neorxnawonges: mid nerigende

What is "*neorxnawong*"? Both the Latin and Mr. Lumby's translation tell us that it means "*Paradise*," but how comes it to mean "*Paradise*"? It is literally the Leisure field, the field where there is no care. The notion is perhaps a little heathenish; there is surely in the word a touch of the Elysian fields or of some Teutonic equivalent. But both the word itself and the word from which it is formed have vanished from modern English; so has the verb "*nerigan*" and its participle "*nerigende*," the preserver, the bestower of shelter, here used as a name of the Saviour. A little philological tact will show any one the meaning of *Healand* in the same use; but the best scholar must turn to his dictionary for "*nerigend*" the first time he comes to the word. On the other hand, this same poem enables us to add one to the list of Latin words which crept into English at an early stage. The Latin "*versus*" appears in the form of "*fers*":—

a ic feringa: forht and unrot:
þas unhyrlican fers: oððe mid sange

This word "*fers*" seems to be unique at so early a date, and the question of Latin words in Old English is suggested again in the end of the poem. There we read:—

seo frowe: þe us frean acende
metod on moldan: meowle seo clæne
æt is Maria: madena selast

"Frowe," so familiar in High German, is said to be unique in English; the masculine "*frea*," which has vanished from modern tongues, is more usual; but can "*meowle*," used in the special sense which it bears here, have anything to do with "*mulier*"? Both words mean woman, but woman in exactly opposite characters.

The next piece, "*Lār*" suggests a thought to us. It is addressed to some one who is described as "*hár hilderinc*," hoary warrior. These words are used in the song of Maldon among other descriptions of the ealdorman Brihtnoth. Is it possible that this piece was addressed to him? It is a mere thought that flashes across the mind, for exactly the same words are used in the song of Brunanburh of Constantine of Scotland, to whom our poet cannot be conceived as addressing his lore.

Mr. Lumby's notes are almost all verbal, as indeed there is not much room for notes of any other kind. Here is one distinctly, ingeniously marked:—

Line 302.—*unbleoh*, a word not found elsewhere, seems to be intended as the equivalent of the *incolumen* in Latin. The sense may perhaps be arrived at in this way: *bleoh* may, as the name of the colour blue, have been applied, as the English word is now, to that which is livid from approaching decay; and thus *unbleoh* would bear the sense of *uncorrupted*. But with a word which only occurs here much must be uncertain.

There is a full index of words, and throughout Mr. Lumby has done his work with great care. We shall not object to some more theology of the same style and date, though certainly romance and adventure, social life and fun, of the same date would have been more attractive still.

* *Be Domes Dæge, De Die Judicii*. An Old English Version of the Latin Poem ascribed to Bede. Edited, with other short Poems, by J. Rawson Lumby, B.D. London: Published for the Early English Text Society by N. Trübner & Co. 1876.

REEVE'S JOURNAL OF A RESIDENCE AT VIENNA AND BERLIN.*

MR. HENRY REEVE is fully justified in publishing these pages from his father's journal. Yet Dr. Reeve, although he was a man of considerable attainments, and was one of the early contributors to the *Edinburgh Review*, had but slight pretensions to literary brilliancy. There is nothing very sprightly in his observations on men and manners; he shows no great shrewdness in his appreciation of characters, nor much power of reproducing their salient features; nor does he make any original contributions to the history of those great events which were happening on the other side of Europe when few Englishmen were abroad. But he travelled with excellent introductions and moved in most interesting society. He was enough of a scholar and a man of science to have a claim on the consideration of the *savants* of the time; and his journal is written the more simply and pleasantly that it was written with no idea of publication. Moreover, as his son remarks in the preface, the mere lapse of time undoubtedly gives a value to contemporary impressions, however slight, of great historical events, and we may add that there is an interest in the references to ways of living and travelling on the Continent as they were three-quarters of a century ago. Dr. Reeve had something of the best tastes of a Boswell. He had the spirit of intelligent adventure which Johnson so highly commended. He never enjoyed himself so thoroughly as in the company of eminent men; he was far more of a cosmopolitan than most of his contemporaries; and was sufficiently master of foreign languages to make the most of his varied experiences of travel.

It was Dr. Reeve's good fortune to find himself in Vienna in the eventful autumn of 1805. Napoleon had just changed his mind as to the long-threatened descent on our coasts; or rather, he had adopted the alternative plan which he appears all along to have had in contemplation. "The Army of England" had been directed upon Austria. Then came the affair of Ulm, where Mack signed his disgraceful capitulation; and the Viennese were regarding the approach of the French with well-founded apprehension. For Vienna, although still nominally a fortified city, was in no position to stand a siege. The ramparts, which have since been levelled and built over, were as yet maintained in repair. But even then Dr. Reeve writes that, while "the town within the ramparts is small, the faubourgs are very extensive, and have every appearance of a rich and numerous population." Relatively speaking, business in the city was more active than it has been since, until it received a new impulse the other day from those financial speculations which have proved so disastrous. Decidedly the life in the streets must have been more picturesque then than it is at present. We are told that the city had become the resort of people of every language. Many Greeks and Turks had availed themselves of the provision of the treaty of Passarowitz which permitted them to settle there and carry on trade, without license from the Government or payment of taxes. Adventurers and sharpers had largely availed themselves of so exceptional a privilege; the Italians, of whom there were plenty, are said to have borne no better character; and, although it was diamond cut diamond when they came to deal with each other, many of these foreigners had made great fortunes. The prospect of being subjected to forced contributions, possibly exposed to sack and pillage, was anything but agreeable. And the receiving of these disreputable strangers would seem to have demoralized the natives. The modern Viennese hotels are about the most extravagant in Europe; but the director of even the most imposing of them would hesitate before sending in such a bill as Dr. Reeve got from his landlord after one night's lodging in those days of ridiculously moderate prices. At first the Englishman declined to pay six florins for his bed, whereupon his baggage and his carriage were impounded. With some trouble he succeeded in removing his trunks, but only on condition of abandoning the carriage; and we are left to suppose that in the end he had to submit. We may measure the landlord's rapacity by the fact that, in the quarters to which Dr. Reeve moved, he hired a comfortable apartment, with special additions to its furniture, for thirty-six florins a month, including everything but firing and candles. At that time the *table d'hôte* system was no more in vogue than it is at present. You could dine exceedingly well at the most fashionable restaurants for about four shillings, wine included; and although the price compares very advantageously with modern charges at first-class houses, it does not strike us as extraordinarily reasonable. As for the morals of society, they left much to desire. "No city, perhaps, can present such scenes of affected sanctity and real licentiousness." Indifferent character was no bar to social consideration. Ladies of quality made no secret of their *liaisons*; gentlemen showed themselves ostentatiously in public with their mistresses; and the topics which were matters of course in the best circles of Vienna would have shocked a party of decent English people. Literary censorship was in full force; every book and newspaper had to be submitted to it before passing into the hands of the public; consequently the intellect of the people was paralysed, and they were thrown back on frivolous amusements and dissipation. The Viennese are pronounced to be a very sensual people; and we do not fancy that recent visitors to their city will

find that they have much changed since the beginning of the century. Now, as then, the cheap theatres, dancing-rooms, beer-halls, and eating-houses are crowded with the classes who in England stay quietly at home; while in the Würst-Allée in the Prater there is still a perpetual fair, where the boisterous enjoyment of the passing hour seems always trembling on the verge of orgies.

Considering the restrictions imposed on the press, and the humiliating and embarrassing position of the Government, it is no wonder that ill news travelled slowly, and that intelligence was cooked before it was published. Mack capitulated on the 17th of October, and the negotiations were completed two days later. But it was only on the 26th of the month that Vienna was startled by the announcement; and then the national vanity was soothed by a romantic version of the disastrous event. The General—so it was said—had been taken by surprise, the French having stolen a march on him by passing through the territory of Anspach. The Austrian defence had been desperate. The position round Ulm had been fiercely contested for four days, and only surrendered when it became absolutely untenable. "Every one seems chopp-fallen, though 'tis curious enough very few talk about it. The Official Gazette says very little, and the people seem to be afraid of saying more, as if the truth would come out more melancholy by inquiring about it"—which would very certainly have been the case. Dr. Reeve goes on to remark on the extraordinary resources of Austria. She had lost whole armies time after time, and yet was always in readiness for a new campaign. Austerlitz was speedily to follow Ulm, and the line of march from one to the other lay through the streets of Vienna. By the 8th of November there was a very general exodus in expectation of the arrival of the French. The tariff for a pair of horses to Presburg was 200 florins, and twice as much was asked for a boat. The rush was chiefly in the direction of Hungary, for the Russians swarmed on the northern roads. On the 10th the municipality sent a solemn deputation to the enemy's outposts, to symbolize the act of submission with a finely-gilded set of keys. The communications exchanged from either side were conducted with extreme courtesy. The camp fires of the French might be seen on the heights of the Kahlenberg; and it was sought to conciliate the magnificent Murat with the appropriate present of a service of plate. Immediately afterwards the city was occupied, and two days after the battle of Austerlitz arrived the tidings that the armies were engaged. The reports that reached Vienna gave the strength of the allied armies at 105,000; 15,000 more men than are estimated to have been in action, even according to the narrative of M. Thiers. But this discrepancy to the disadvantage of the vanquished, with the complete and comparatively accurate accounts of the defeat which contrasted so strongly with the misrepresentations of the capitulation of Ulm, may be attributed to the fact that the Viennese were indebted to the victors for their information.

Dr. Reeve's account of the behaviour of the French is very noteworthy. "Never was a conqueror who used his victory and triumph with such moderation; never did a numerous and victorious army behave with more forbearance and moderation." Excesses, when they did occur, were punished severely. The exemplary conduct of the invaders may be taken as a proof of the commanding authority of Napoleon, who beat the Austrians with a certain consideration, as hoping to secure them for his allies and friends. But even the Imperial authority could not altogether alter the character of the troops; and we read that the common soldiers were affable and amiable, showing great good humour, but no frivolity. Dr. Reeve witnessed the return of the Austrian Emperor to his capital, which, with questionable taste, took the form of a triumphant entry, and was conducted with great pomp and parade. But the red-letter day in his journal was the 22nd December, when, as he emphasizes in capital letters, he saw Napoleon Bonaparte at Schönbrunn. Amid the state and military pageantry which the Emperor affected, he was simply dressed in the regimentals of his guards. "His countenance struck one as very remarkable. Fuller, broader, and fatter than I had expected to have seen it, and his person stouter and older than usually represented. He has the usual marks of the sanguine, melancholic temperament, dark hair, small dark eyes rather fixed than animated, and a very piercing countenance." Lavater, he adds, might have singled out such a face in a crowd, as bearing the marks of a very extraordinary man. From Vienna Dr. Reeve made his way homeward by Prague and Berlin to Hamburg, whence he took shipping at Cuxhaven, after a somewhat anxious time of detention. He gives more or less detailed notes of his interviews with men who were famous, or fast becoming so. Perhaps the most interesting of these reports is of a conversation with Humboldt, then a plain-looking man of about thirty, talking four or five languages fluently. Humboldt had rather resented the criticisms of some English journals on his travels, and he took pains to confirm to his visitor some of his most startling statements. Dr. Reeve attended a lecture of Fichte's, although he held the renowned philosopher but cheaply; and, as his son remarks in a note, he had the singular good fortune to have seen and heard five of the most famous musical composers—Haydn, Beethoven, Romberg, Himmel, and Meyerbeer. But there is hardly a page of this short journal that is not more or less entertaining, and we lay it down with a very agreeable impression of the man who was able to collect its materials.

* *Journal of a Residence at Vienna and Berlin in the Eventful Winter 1805-6.* By the late Henry Reeve, M.D. London: Longmans & Co. 1877.

RELIGIOUS SOCIETIES OF THE COMMONWEALTH.

THE phrase "Religious Societies" in Mr. Barclay's title-page is not unlikely to mislead the unprepared reader of his interesting book. His actual subject is the history of Quakerism, which his widow paraphrases in her prefatory note as "the Religious Society to which the author belonged." That a new account of the origin and progress of this once conspicuous sect was the subject which he set before himself when he began to write is evident from his own words early in the volume. "George Fox commenced his ministry in the year 1648, and therefore," says Mr. Barclay, "our subject will lead us to look both backwards and forwards from this historical standpoint." George Fox is thus made the central figure in Mr. Barclay's painstaking exposition of the "inner life of the religious societies of the Commonwealth." Although there is no mention of him or of Quakerism in the title-page, it is undoubtedly the author's assumption that there was a sort of harmonious finality in the doctrine and the polity of Fox. All previous and all contemporary religious thought and movement in England, and partly also in Germany and the Netherlands, are referred to Quakerism, either directly or by implication, as if it were the goal at which all the prior "religious societies" were blindly aiming, and the standard by which all the subsequent "religious societies" must be measured. Indeed, if Mr. Barclay had carried his inquiries further back and wider abroad, we conceive that he would have treated the entire history of Christendom down to the year 1648 as a kind of *preparatio evangelica* for the manifestation of the evangel according to George Fox. There can be no doubt that this was the conception held by Fox and the early Quakers, at least during their enthusiastic and aggressive labours prior to the Restoration—from 1648 to 1660—concerning the position of the Quaker sect. But there is a very noticeable difference between them and their latest historian and apologist. George Fox believed that Quakerism was the one and only true "religious society," that it was the final restoration of the genuine visible Church of Christ, and that Popery, Episcopacy, Presbyterianism, Independency, and Anabaptism were fundamentally irreligious societies, to which it was blind or sinful to belong. Whatever was outside Quakerism was "the world." Mr. Barclay sees that the original claim of the Quakers was monstrous. "The Society of Friends," he unassumingly says, "was the last religious society formed during this extraordinary period." The new title marked a stage in the decline of the original claims of Fox and his fellows. Quakerism, as defined by this mild title and as at present understood by Quakers, has no affinity whatever except that of outward historical succession to "The People of God, whom the world calls Quakers." Quakerism was not a people, one amongst others, but definitely, The People. If we study its relation to its contemporary rivals during the Commonwealth period from the marvellous living standpoint of Fox's journal, or from the fiery aggressive pamphlets of his first circle of disciples, rather than from the coldly apologetic standpoint of Mr. Barclay's book, we shall recognize the strange difference between the original thing itself and his modern picture of the thing. George Fox never for an instant supposed that he were merely adding one more specimen to that multiplying heap of sects which Mr. Barclay describes as "the variety of religious organizations which Christian men had been induced to establish in England."

We shall have no doubt of this if we read Fox's first conception of the relation between his own and every other "religious society," as he stated it in the year 1648, at the very beginning of his activity as founder and preacher:—"I was to bring people off from all their own ways to Christ the new and living way; and from their churches, which men had made and gathered, to the Church in God." The phrases "made" and "gathered" in this passage are technical. By "made" churches, Fox meant the Church of England and the new Presbyterian establishment; by "gathered" Churches, he meant the "religious societies" of the Independents and Baptists. He goes on to say that he was "commanded" to

bring people off from the World's worship . . . and I was to bring people off from the World's religions, which are vain; . . . and I was to bring them off from the World's fellowships, and prayings, and singings, which stood in forms without power. . . . And I was to bring people off from men's inventions and windy doctrines, by which they blowed the people about, this way and the other way, from sect to sect; and (from) all their beggarly rudiments, with their schools, and colleges for making ministers of Christ, who are indeed ministers of their own making, but not of Christ's. . . . And in the dread and authority of the Lord's power was I moved to declare against them all; and against all that preached, and not freely, as being such as had not received freely from Christ.

Such passages, which might easily be paralleled by hundreds of similar passages in all the earlier Quaker writers, show plainly enough that the Quaker mission was originally a determined aggression upon all existing "religious societies." Fox was so far from supposing that he added one more sect, church, or religious society to the number already in existence, that he even believed the arrest of the contemporary plague of sect-making, and the destruction of all religious societies except his own, to be the very end for which Quakerism had been supernaturally instituted. Mr. Barclay's assertion that the thousands of pamphlets poured forth by the earlier Quakers were "defensive" is the very reverse of the truth. Fox held that all the præ-Quaker sects

from the Papacy to Anabaptism, in spite of their opposition to one another, "stood in the Apostasy"; they constituted a fearful unity, the "Babylon" from which "God's people" were urged by God to flee, in order that they might find their right home in the one and only visible "Sion," Quakerism. The young Quaker apostles retaliated with interest upon the triumphant Presbyterian and Independent preachers all the obnoxious verbiage with which the latter had for years been assailing the bishops. "They have called me," said Baxter in 1657, "dog and devil, and abundance of such names. I have asked them what was my fault? Forsooth, it was that I was called Master, that I stood above the people in a pulpit, that I preached by an hour-glass, that I preached by doctrine and use, and such like. They revile the ablest godly ministers. They cry down the ministers and ordinances of Christ, and say the Spirit bids them do it. They pronounce damnation against God's Church." Mr. Barclay, on the other hand, undoubtedly compelled by the logic of events, regards Quakerism merely as one among a number of "religious societies," probably the best of the number. While the founder of Quakerism called it "the Church," and could see no other visible Church on the earth, Mr. Barclay again and again speaks of it as "a Church," and he freely concedes the same title to other "religious societies." We constantly come upon such phrases as "the Church of England," "the Independent and Baptist Churches," "the Wesleyan Church," "the Society of Friends and every other Free Church." A religious society is a large and loose phrase; it may mean an *ecclesia in ecclesia*, such as the Benedictine order, or as Methodism before Wesley's death; but it is evident that this is not Mr. Barclay's use of the phrase. He uses it as a synonym for what some persons call "a church," and others call "a sect." We will not quarrel here over the name.

Each English "religious society," or "sect," or "church" of the seventeenth century, if its present condition is to be understood, must be examined scientifically. It must be contemplated from its own historical starting-point, and traced stage by stage along the course of its development. No social phenomenon, such as English Presbyterianism or Quakerism, can possibly be understood apart from its history. To pick out characteristic pieces of doctrine and ritual from Mennonites, Anabaptists, Familists, Seekers, or Muggletonians, after Mr. Barclay's method, is to be helpful and serviceable to historians, but it is not to be an historian. Every successive religious society, church, or sect of the commonwealth must have had some moment and manner of departure from something or from somewhere, by which departure it set up for itself, obtained a distinct self-consciousness, and became a "Church." A sect is plainly a section; it has departed from some whole. When did it depart? From what did it depart? Each successive English "religious society" must either have departed from the National Church or else from some prior "religious society" which had already departed from the National Church. We cannot possibly understand these English Israels unless we know something of the English Egypt from which they made their exodus, and discover the grounds of their departure. We think that Mr. Barclay has worked in a more tolerant and generous temper than Crosby and Ivimey, the historians of the English Baptists, or than Hanbury and Waddington, the historians of the English Independents; in the case of every English "religious society," except the very largest and widest, he has striven to put himself in as full sympathy as he can with its adherents, and to state their claims and beliefs from their own point of view. The Church of England is the one religious society of the Commonwealth period concerning which Mr. Barclay presupposes that every man already understands everything without need of inquiry. Yet the historian of the sects of a nation at a particular epoch of its life surely ought to pause somewhere and ask himself, or remember that his readers will ask, what a National Church is? Where and when and how and why did it become the Church of the Nation? How does a citizen become a member of the religious society which claims to be the citizen's own Church? Until these or similar questions occur to the historian of a sect, he has never laid his hand upon the key to that sect's history. The very existence of each new sect, or church, or religious society is a charge by implication against the sect, or church, or religious society from which it departs; and its charges against its Egypt, whether true or false, are important parts of the history and "inner life" of the new Israel.

Mr. Barclay, in spite of the really honest and genuine study—the study, indeed, of a *dilettante* collector rather than of a scientific inquirer—which he has directed towards the meanest details of the life both of the now extinct and of the still extant religious societies which departed from the Church of England in the seventeenth century, has lazily and uninquiringly accepted in the lump the entire body of confused Dissenting tradition concerning that great original English religious society, the Church of England. It is actually his opinion that the English "religious society" represented by Mr. Spurgeon is more ancient than that represented by the Primates of All England. Of course, on the hypothesis that the Apostles were Anabaptists, or Independents, or Quakers, or Wesleyan Methodists, it is quite reasonable to account the Pope himself a less true successor of St. Peter than Mr. Spurgeon, or Mr. Dale, or the author of this book, or Mr. Punshon. Mr. Barclay, however, does not speak of the historical priority of "religious societies" in general, but of the historical priority of English "religious societies." "As we shall show afterwards," he writes, "the rise of the Anabaptists (in England) took place long prior to the formation of the Church of England." After this, we are quite prepared to read that the true ecclesiastical

succession went on in the dark, and that "in the space of the direct transmission of Divine Truth, it seems probable that these Churches have a lineage or succession more ancient than that of the Roman Church." Nor are we surprised when Mr. Barclay informs us that "the Puritan party also had its rise in the reign of Queen Mary, and consequently prior to the final sanction of the constitution of the Church of England by Parliament." The word "sanction" may stand for much which is not expressed. But a "party" is merely a finer word for a "part." A part, like a "sect," implies the whole of which it is the part. Of what pre-existing whole, if not of the whole National Church, was "the Puritan Party" in Queen Mary's reign a part? The historical fact is that the *Ecclesia Anglicana* mentioned in the Great Charter is an immense "religious society" which has in its substance, and in the regard of English law, continued unbroken from that day to this. The relations of the ministry of the Church of England to the Pope were altered and re-altered during the Tudor period; the ministry itself was altered during the Civil Wars and the Commonwealth; but the national religious society, the totality of christened English persons and parishes, to which Roman Catholic, Anglican, Presbyterian, and even Independent and Anabaptist ministers successively ministered, continued throughout all these changes substantially one and the same. Even the patronage of the livings was not disturbed amidst the other disturbances of the Commonwealth period. Cromwell resisted all the appeals of "the Sectaries" to interfere with it. The conditioning power of the Bishops over the patron's choice was transferred to the notorious "Triers"—that fierce Calvinist Inquisition against which the old Anglicans and the new Quakers had common cause of complaint. The sermons of the Presbyterians and Independents before the Parliament are full of complaints that the common people, the substance of the National Church, were "lusting" after the Common Prayer, their old prelatial ministers, their abolished Christmas-days, and that general atmosphere of social and ecclesiastical freedom upon which the new Puritan incumbents made such autocratic encroachments—denying the Eucharist to all parishioners whom they considered unconverted, and withholding baptism from the children of those who were held to be "out of the covenant."

Mr. Barclay has failed to catch that distinctively twofold character of his own society by which it was originally distinguished from all its contemporary rival societies. No doubt he has hit upon one of the external reasons why the Quakers outlived the Seekers, Waiters, Ranters, Behmenists, and a host of others, with whom they had many features in common. Most of these societies were independent. Quakerism, on the contrary, George Fox being a consummate statesman as well as a preacher, was most effectually centralized and organized; each little body of Quaker believers, as soon as it was gathered, was affiliated to the whole brotherhood, and brought in subjection to the amazing discipline invented by the patriarch of the Quaker Church. It is with regard to its inner matter rather than to its ecclesiastical form that we perceive a strangely twofold character in Quakerism. The new sect was at once an extension of the Puritan cultus along some of its lines to the utmost possible limit, and at the same time it was the fiercest reaction against the traditional Puritan theology. When the Parliament and the Westminster Assembly of Divines conceived that they had finally expelled from the English nation the last relics of anti-Christian ritualism and sacerdotalism, an army of fierce young men suddenly began to appear in every market-place, and to interrupt the ministers in the churches in every part of the land, declaring that the preacher's black cloak was anti-Christian, his pulpit a relic of idolatry, baptism itself an abolished symbol, and extending the hated title "priest" to every Independent and Baptist preacher who took tithes or received a stipend. While the half-Puritan Presbyterians and Independents had abolished mass-vestments in their ministry, these whole-Puritans abolished all vestments; Fox was commanded to put off his shoes and stockings before entering the city of Lichfield to call it to repentance; some of the early Quaker preachers, women amongst them, were required to put off everything, and "went naked for a sign." If they offended English Puritanism on one side by immeasurably surpassing it, they offended it still more on the other side by flatly contradicting it. The Quaker proclamation of "the true Light who lightens every man who comes into the world" was regarded by the triumphant Calvinists as a reappearance of the detested "Arminianism," or doctrine of the universal redemption of mankind, which they thought they had expelled from England with the beheading of Laud, the deprivation of the Bishops, and the imposition of the Covenant. The belief that Fox, Burroughs, Dowsbury, and others were Jesuits in disguise was undoubtedly genuine. Even Baxter accepted it. The Anglicans and Quakers had up to a certain point a common cause. They were bracketed together as "Arminians." The restoration of the old episcopacy and priesthood was at first a relief to the Quakers. Sewall says that seven hundred Quakers who had been imprisoned under Oliver and Richard Cromwell, mainly at the instigation of the Presbyterians and Independents, were set free at the Restoration. Their later persecution was political rather than religious; it was a result of the terror caused by the rising of the Fifth Monarchy men. The mass of the English people dreaded above everything a return of the Puritan ascendancy. It must be remembered that a very large proportion of the early Quaker preachers had served in the Parliamentary army, that fruitful birthplace of new sects; and the fiery language of the Quaker pamphleteers and preachers, who began their tracts

and their sermons with "Thus saith the Lord," was sufficiently like that of the Fifth Monarchy men to justify the fear that there was some underground alliance between the disciples of Fox and the followers of Venner.

Perhaps no passage in Fox's journal gives a clearer evidence of the exclusive claim which he made for his own religious society than his reply to Cromwell's proclamation of a Fast for Rain during the great drought of the year 1657. He imagined that the Almighty used the drought as an occasion for miraculously confirming the claims of the Quakers to be His People, and for confounding the rival claims of all the Puritan religious societies. "It was observed," says Fox, "that as far as Truth had spread in the North, there were pleasant showers and rain enough; when to the South, in many places, they were almost spoiled for want of rain." He told the Protector that, if he "had come to own God's Truth," that is, if he had turned Quaker, he "should have had rain; that drought was a sign unto them of their barrenness and want of the water of life."

MY YEAR IN AN INDIAN PORT.*

THE title of these volumes is rather likely to mislead. Readers might expect to find some experience of the Indian Mutiny, or a narrative of a twelvemonth spent at some fortified post on the Punjab frontier, where horses are carried off, under the noses of the *Syces*, from the stables of the Deputy-Commissioner at midnight, and where Residents dare not take an evening drive a mile or so from cantonment without an armed escort. These two volumes deal, however, neither with raids nor sieges, but with the most pacific details, and the fort in which the author passed her time pleasantly is more like some of those old walled towns in parts of the Continent with promenades and ramparts. Indeed a sketch of the bastion in the frontispiece shows that the structure would not long resist modern artillery. Belgaum, the groundwork of these volumes, is a very favourite station in the Presidency of Bombay. It lies some way to the south of Sattara, above the Ghauts or mountain ranges which form a striking feature of the Malabar coast, and at about the same altitude as Poona. It is easily approached in two ways. The traveller landing at Bombay can, if he likes, run down the coast some two hundred miles in a steamer to the port of Vingorla, from which place the journey is easily accomplished across the strip of land at the foot of the said Ghauts, up through the passes, and so on for thirty miles or so of the table-land of the Deccan, to the station itself. Mrs. Guthrie, for some reason, preferred the railway to Poona, a trip of a hundred and twenty miles, and then the transit by bullock cart, through Sattara and Kolhapore, to what is one of the finest of the Collectories of the Western Presidency. A good deal may be said in favour of these two volumes as light, pleasant, and not unattractive reading. The author has a good eye for colour, a quick perception of unfamiliar usages, and a flowing and lively style. Some forty pages about the Bay of Biscay, the Red Sea, Perim, and the Indian Ocean, might, however, very well have been spared us; and Mrs. Guthrie has an unfortunate habit of picking up and retailing bits of Indian gossip and the idle talk of the caddy table, without applying the most ordinary canons of criticism. Occasionally, too, her eyes or her ears must have deceived her. For instance, the Suez Canal is not yet perfect, and the dredging-machines require to be incessantly worked; but we must doubt whether at any part the Canal is "so narrow that a good jumper could have leapt across it." Sir F. Lasseppe will have a right to be indignant if his great work is thus dwarfed on paper. "Paddy birds" are not usually seen in the Indian Ocean in company with shoals of porpoises, nor can we make out what buildings on the shore of the harbour of Aden, where the steamer did not touch, could have been mistaken by Mrs. Guthrie for "cavalry barracks." It must be new to most readers that the beginning of the Mutiny had nothing whatever to do with cartridges greased with bullock's fat. Sir John Kaye, had he lived, would have learnt with some surprise that the outbreak was occasioned "by a clergyman who put his hand on the head of a little Hindoo child"—the very touch of a *Padre*, it seems, being pollution. A legend which points out a certain banyan-tree between Kolhapore and Belgaum as the camping-place of our Iron Duke has more of the air of trustworthy tradition about it. As a set-off in the other direction, we are told of some other tree, somewhere on the Nerbudda river, under which Alexander the Great is said to have slept. Now, from Argaum to Arbela is rather a long stride. Neither should we recommend much faith to be put in the general statement that "natives have a prejudice against keeping poultry," the dislike to the domestic fowl being of course limited to Hindoos; or again that good mangoes are not to be had in perfection inland or away from the salt sea spray, or that Hindoos will not kill snakes. Such rapid generalizations and incautious comments would scarcely have been made had the one year of exile been prolonged. These volumes besides are terribly disfigured by reiterated misprints. Even the commonest and most rudimentary Indian terms are distorted. *Sari*, the female dress, is everywhere *Savi*; *Puja*, worship, is either *puga* or *pugi*; *talc* becomes *talk*; Nudiya, the stronghold of Sanskrit learning and Brahminical orthodoxy, is Nudiza, the letter *z*, by the way, being unknown in the *devanagari* alphabet; Vicramaditya, the well-known ancient King of Ujjain, fares little better;

* *My Year in an Indian Port.* By Mrs. Guthrie, Author of "Through Russia." 2 vols. London: Hurst & Blackett. 1877

and there is a general contempt, all through the volumes, for that reasonable accuracy in small things which an airy narrative can as little dispense with as the most ponderous treatise crammed with Oriental erudition. These blemishes apart, most of the chapters can be read with pleasure; and as we have had so much recently about the Taj Mahal, the Kootub, the East Indian Railway, and the Residency at Lucknow, it is rather refreshing to turn to the recollections of a lady who tells us what life is like on the high table-land of Southern and Western India.

One of the best parts of the book is the description of the Fort itself. It stands in the midst of a large undulating plain, with ranges of hills of fair height in the distance, and tradition ascribes its construction to some Raja of the Jain sect, who was hereditary chief of Venegrama, since corrupted into Belgaum. In the fifteenth century, when the first break-up of the Mahomedan power of Delhi took place, before its reconstruction by Akbar the Great, and when usurpers of that faith established independent kingdoms in several parts of India, Belgaum came under the sway of the princes of Beejapore. The fortress was enlarged and repaired by a governor named Azad Khan in the sixteenth century, and stories of his stud and his elephants, his wars and his magnificence, fill the popular imagination to this hour. Of course Belgaum is associated with the raids of Sivaji, the founder of the Mahratta power; but nearly sixty years ago, during the administration of the Marquess of Hastings, it had to succumb to a British force, which captured the place in the teeth of prophecies to the contrary. This was after the decisive battle of Kirki, which put an end to the Peshwa's power. Mrs. Guthrie briefly notices the troublous times of the Mutiny, but she hardly does full justice to the calmness and determination of the civil and military authorities of Belgaum at that day. Emissaries of the Nana were spreading lies and fomenting intrigues all over the Southern Mahratta country. Some of the chiefs were wavering in their allegiance; two native regiments were barely held in check by a battery of artillerymen, a few English soldiers of the depot of the 64th, and some pensioners, until the third week in August, when the Government of Bombay managed to send 250 British troops to the spot; and one fine young Englishman was assassinated by the Chief of Nurgoon, who afterwards very properly paid the penalty of his crime. Yet there was no outbreak; a plot was detected, and after the arrival of the English reinforcement its agents were blown from guns, while communication was never interrupted between Belgaum and Central India, nor was the standard of mutiny openly unfurled. The chief civil officer of the district was enabled further to co-operate with the Portuguese authorities in maintaining order on the frontiers of Goa. Indeed it has often been said that at such emergencies British supremacy was maintained more by the bearing and pluck of its representatives than by material defences, although the fort at Belgaum did enable the authorities to feel some sense of security. As a residence we believe it to be quite as attractive as Mrs. Guthrie makes out. The mixture of ancient temples and comfortable bungalows; the fine trees and the good supply of water; the ancient archways within and the broad esplanade without; the English church and the well-stocked kitchen-gardens; a cool climate for the greater part of the year, and a district affording capabilities for sport of many kinds—these invest Belgaum with a charm exceeding anything to be found in the northern districts of Broach or Surat. We do not quite make out what Mrs. Guthrie means by the "moors" over which she looked out in the vicinity of her residence. Some excellent sketches of that country, now before us, lead us to think that she refers to undulating and open tracts of country from which much of the original jungle or scrub has been cleared, without the clearance being always followed by regular cultivation. We do not expect in such a work disquisitions on the land revenue or on the peculiarities of the natives, and are quite content that the author should confine herself to descriptions of schools and festivals, religious processions, feats of snake-charmers, and other incidents which impart a little variety to the round of dull, plodding official life.

In the second volume we have a very spirited and not overdrawn picture of the commencement of the rainy season, or, as it is called in that Presidency, the bursting of the monsoon. Nothing in Bengal or Upper India can equal the fury of the rain-clouds which, rolling up from the vast expanse of the Indian Ocean, are dissolved with hail and thunder on the long line of the Western Ghats and the uplands of the Deccan. Mrs. Guthrie also pithily says something to the effect that in Europe we seek after nature, while in India nature seeks us. This really means that in the latter country insect and animal life overpowers you in your study and your bath-room, invades the kitchen, devastates the garden, ruins your library, and makes holes in your wardrobe. She also observes, what few persons in any part of India will dispute for a moment, that even in a populous town or a large cantonment, midnight is often far more noisy than midday. With the exception of a few hours before dawn, night is the period when human beings and animals wake up to activity. Dogs bark; jackals howl in concert; frogs croak, at least during the rainy season; marriage processions make their noisiest din; watchmen hawk, hew, and groan on their rounds with the most exasperating periodicity; and divers members of the household drone, after a full meal, over ancient ballads or the mythic exploits of Urjun and Rama. Anglo-Indians need scarcely be told that what the author terms "the marrying months" are periods of the year, notably February and March, in which such ceremonies are consistent with Hindu superstition as to dates.

Perhaps the best chapters in the book are the last four of the second volume, the fruits of a well-earned but brief holiday spent in the territories of Goa. Very judiciously, instead of taking the comparatively well-known road to Vingorla, the holiday-takers went right through the Ramghat Pass to the Portuguese capital. The cathedral, we should state, can be seen in clear weather from the top of the Ghats, some forty miles off. Everything in Goa tells its own story of decay and dilapidation. Coffins are exposed to sight. Old Goa, as distinguished from the modern town, is in ruins. A solitary nun was seen in one place, and a few ecclesiastics mumbled their church services in the church of Bom Jesu twice a day; and one ancient palace of the Viceroy was shrouded in thorn jungle. At the modern town the walls of the fort had half filled up the ditch. There was, however, a fine statue of Albuquerque, and the shrine of St. Francis Xavier is pronounced magnificent, yet without any tawdry or excessive ornament. All this is comparatively untrodden ground, and the author throws out a hint to political writers which some one may pursue. Goa is small in extent, and of little value to the Portuguese. Its ancient magnificence is gone. Its modern industries are paralysed, and choked by mismanagement and excessive export dues. It has, however, a fine harbour, and it fits in neatly with other British possessions. Suppose the Indian Government were to buy it for a good round sum! We fear that national pride would operate with the proposed vendors, and financial difficulties with the purchasers, to prevent such a transfer. But all who care to know a little of the Southern Mahratta country may take up these two volumes and gather from them a good idea of the lives that may be led by intelligent Englishwomen, the wives of hard-worked engineers, civilians, or officers on staff employ.

HALF-HOURS AMONG SOME ENGLISH ANTIQUITIES.*

IN these days, when not only are there some half-dozen Archaeological Societies in the country, but almost every county is setting up its local association and museum, it is incumbent on intelligent folks to qualify themselves for passing muster in at least the rudiments of English antiquities. Longer or shorter home tours, which are becoming more and more of a fashion, supply opportunities for testing and adding to this knowledge at every turn; and it is astonishing how much the charm of such rambles is enhanced by the study of a barrow here, a cromlech there, the traces of a Roman road in this district, or examples of sepulchral brasses or crosses in that. For the cultivation of an easy familiarity with such subjects a great desideratum has always been a handy *vade mecum*, giving within manageable compass a succinct account of our characteristic antiquities, whether grave-mounds and their contents, flint, stone, and bronze implements, ancient pottery, arms and armour, sepulchral slabs, coins, and bells of various periods, or personal ornaments, &c. Such a handbook would be of much service as a preparation for a special scrutiny of particular antiquities, and would make both profitable and instructive a visit to such old memorials as, for example, the famous stone circle of Rollright, near Long Compton in Warwickshire, the old Roman stations of Caerwent and Caerleon, the remains at Woodchester, Lydney, Uriconium, and Cirencester, or Corinium. It would also assist the student in consolidating his knowledge, and adding to it, as occasion serves, by leading him to greater works like *Iaca Silurum*, Buckman and Newmarsh's *Corinium*, and the able book on British Epigraphy by Dr. McCaul, of Trinity College, Toronto. A work of this kind, comprising some two hundred and thirty pages, has just been published by Mr. Llewellyn Jewitt, who was already known by his larger volume on *Grave-mounds and their Contents*, first published in 1870. The present *Half-Hours* is the first instalment of a series of similar volumes devoted to the illustration of the old memorials of our land; and, apart from its intrinsic value, it will no doubt tempt many a reader to go on to more extensive and systematic investigations.

Mr. Jewitt's observations have convinced him that the original form of all the barrows was circular, and that this shape has not been varied through any difference of period or race. Where it has become elliptical, or taken the "long barrow" form, he is of opinion that this is owing only to additional interments or afterthoughts, which explain such phrases as "twin burrows," or intercommunicatory mounds. His first sectional drawing shows a stone cairn over the contracted body simply laid on the natural surface, the outer ledge of the circle being formed of rough slabs laid one on another, upper ends inwards. The second is a stone barrow, with a circle defined by a ring of stones raised over two interments—one a cinerary urn containing the burnt remains of the dead, covered with a slab; the other simply burnt bones and ashes heaped on the natural surface. The third is similar, save in the inversion of the urn containing the ashes. The outer circle, as before, is defined by large stones. In all these cases, over the interment there had been formed a mound of loose stones, and over that a thick layer of earth. Often, it would seem, the earth was part of the original design; but sometimes it was only the result of decaying vegetation. In Section Four it was the former, as is indicated by the remains of fires on the surface, and the outer coating of earth above the layer of burnt earth and charcoal; sometimes, as in Gib Low Barrow, there is evidence of successive interments by different races. Four mounds

* *Half-Hours among some English Antiquities.* By Llewellyn Jewitt, F.S.A., &c. London: Hardwick & Boguo. 1877.

here had occupied the surface of the ground, over which had been raised a large barrow, having a cromlech-like cist in its upper portion. In another instance, engraved by Mr. Warne, the tumulus of alternate layers of chalk and earth exhibited six successive sepulchral deposits, some by inhumation and others by cremation. Curious examples are given of stone chambers and passages in tumuli at Stoney Littleton, Wieland Smith's Cave at Ashbury, and at Minning Low, covered with immense blocks of stone and then mounded over; and the illustration of "twin barrows," or the junction by a bank of two circular mounds, will become explicable by reference to the figure. The sepulchral Romano-British barrows at Eastlow Hill and elsewhere contain large chambers occasionally above ground, and then superstratified with a mound; but often the Roman seems to have shared the ancient Briton's place of sepulture, and Celt and Romano-Briton represent primary and secondary interments in the same mound. The so-called Anglo-Saxon barrows were much less in diameter and height than the Celtic, rising little above the surrounding ground. These, however, are peculiarly rich in remains, and Mr. Jewitt has done well to make a few extracts from Beowulf in reference to the ceremonies of an Anglo-Saxon funeral. The distinction between a "low" and a "barrow" is simply that the former is derived from "hlæw," another word for which, "beorh" or "bearw," has passed into the synonymous word, barrow.

From a chapter on Stone Circles, Cromlechs, &c., the novice will gain a clear idea of the many upright or other stone circles still more or less extant in England and Wales, with legends and Druidic repute attached to them. The circles mostly marked the bases of grave-mounds in conjunction with a shallow ditch. The largest of them, Abury, was originally an irregular circle 1,260 feet in diameter in one direction and 1,170 in the other, with an *agger* and ditch, and avenues over a mile in length and of 40 feet average breadth. Within the general enclosure are two other circles, 325 and 270 feet in diameter respectively. Silbury Hill is another mound hard by, and others of the same character stud the surrounding country. The same is the case within a radius of three miles from Stonehenge, 300 burial mounds being dotted round it. The Stonehenge circle is 300 feet in diameter, surrounded by a fosse and approached by an avenue. In the enclosure was the famous circle so well known by tradition and repute, whose circle of small stones not found in the district is surrounded by a later circle of much larger ones. The great temple of Stonehenge is doubtless synchronous with the surrounding barrows, most of which contain interments by cremation in the fashion of the Bronze Age. Stonehenge is therefore of the Bronze Age, though not uniformly, and Abury is older, because the stones are natural, and not, as at Stonehenge, roughly hewn. Both Abury and Stonehenge Sir John Lubbock believes to have been temples, but most of the stone circles have been proved to be burial-places. Particulars of the relative sizes of the best known circles will be found in Mr. Jewitt's pages, and will stand the reader in stead at Arbor Low, Rollich, Stanton Moor, or Penmaenmawr. The great barrows of Arbor Low, in Derbyshire, connected with the circle, have yielded important remains, but the circle itself was probably rifled long ago. Its centre exhibits parts of a cromlech, and it seems to have been originally composed of flat (not upright) stones surrounded by a rampart or fosse. The cromlechs, so called, upon which much light has been thrown by Mr. W. C. Lukis, and of late years by the Cambrian archaeologists, are now pretty generally agreed to be stone cists denuded of their outer covering, and the Lanyon cromlech, in p. 29 of this handbook, gives an example which any reader's experience will easily multiply.

In such British grave-mounds as we have glanced at, and in the soil under process of husbandry, have been found many implements of flint and stone—celts, hammers, mauls, picks and axes of stone, and flakes, cores, scrapers, borers, spear-heads, and sling-stones of flint. The celt (from *celles*, Latin for chisel) is commonly an oviform flint blade, sharpened to an edge at the lower, broad, cutting end. Owing to its frequently having its cutting edge dulled or chipped, a celt is often found reduced to half or two-thirds of its original length, and to four, six, or seven, instead of sixteen inches. They were commonly fixed in wooden or bone handles, though sometimes doubtless held in the hand alone. The stone hammers include "perforated axes," or, as they were called a hundred years ago, "purgatory hammers," with which the Pagan possessors were furnished, to thunder at the gates of purgatory, after they had taken possession of their barrow—hammers with cutting edge at each end, hollowed and grooved hammers, and others turned up in adze fashion. An instrument which Mr. John Evans conjectured to be a net-sinker is more plausibly decided to be a "punch," or "cutter," such as the modern blacksmith uses; and there is no end of stone implements such as querns and whetstones, and flints including all sorts of delicately shaped arrow-heads, javelin heads, and deadly cutting missiles. Mr. Jewitt has another chapter on bronze celts and similar instruments, as to the uses of which he wisely adopts the cautious vagueness of Professor Wilson, who, in speaking of the bronze axe, palstave, and socketed celt, declines to attempt to discriminate the special purposes of these rudimentary weapons. The mode in which these implements were manufactured is still traceable through the frequent discovery of the stone moulds in which they were cast. Besides bronze daggers, swords, and spear-heads, another terrible implement has been found—a bronze ferrule, the upper part of which is armed with a number of deadly spikes in three alternate rows.

We approach still more curious topics as we come in contact with Roman civilization. It is no small matter to realize the typical Roman road, of which we have still samples in our extant highways; mostly straight, unswerving even for a hill, and raised high above the ordinary level. Our author cites from Vitruvius the process of forming a road. Two parallel furrows were cut to mark its width. The surface earth and loose stones between were then removed till a solid foundation was reached, which was levelled and covered hard with earth. This was the *pavimentum*; and on it was laid a stratum of small squared stones, covered with mortar or concrete—*h.e.* the *statumen*. Over this came a layer of small broken stones mixed with lime in double proportion. This stony concrete was called *ruderalis*, and above it came a layer of chalk, lime, and broken tiles, or gravel, lime, sand, and clay, called the *nucleus*; above which and over all was the surface layer, either of squared flagstones, or a firm bed of lime and gravel. This was the *summa dorsum*, and completed the *agger*. Such was the grand military road along which our itineraries were traced with a milestone, or plain cylinder, giving distances from the nearest town and the name of the reigning emperor, at the end of each Roman mile of 1,000 paces or 1,611 yards. These milestones have mostly perished. We have also details of the remains of Roman bridges over the Thames, Teign, and Tyne, and of the famous walls of Hadrian and Antoninus; with particulars of the arrangement and economy of Roman towns and camps, such as Wroxeter, Colchester, Kenchester, Cirencester, Caerleon, Caerwent, and Silchester. The town was usually a parallelogram like the camp, with strong, massive walls. The Roman villa at Woodchester, in Gloucestershire, is said to be the finest and largest yet unbarred in England. Its two courts (150 and 90 feet square) are surrounded by a gallery, and its principal apartment (50 feet square) has a splendid tessellated pavement, probably based on a hypocaust with a fountain in the centre, and an inscription, "Bonum eventum colite." The materials, except the white stone, are a hard calcareous Gloucestershire stone, like Palombino marble. Woodchester is supposed to have been a villa of Hadrian when he was in Britain in 117 A.D.; and other pavements are found at Caerleon, Caerwent, Lydney, Frampton, Gloucester, and Dorchester.

Of Roman altars there is no scarcity in this country, and not only is their shape with the form and ornamentation of their sides tolerably familiar, but it is part of a classical education to learn to decipher the inscriptions. Capital practice in this will be found in McCaul's *Britanno-Roman Inscriptions*, Leo's *Isca Silurum*, and Roach Smith's *Illustrations of Roman London*. One type of these altars is the not infrequent group of "Dea Matros," or beneficent local deities of good luck, found in Ancaster churchyard, a group of three at one end of a flat slab and a small pillar altar at the other. Others of these are found at Winchester, Newcastle-on-Tyne, in London, and especially on the banks of the Rhine, dedicated *Matribus*, *Deabus Matribus*, *Matribus domesticis*, *campes-tribus*, and *tramarinis* (see Roach Smith, pp. 36-7). Sarcophagi and sepulchral slabs are also abundant. One of a centenarian veteran of the second legion, the Augustan, at Bulmore, near Caerleon, with his aged widow, set up by the son, is very interesting. Little Bulmore is in all probability the site of a Roman villa a mile and a half from Caerleon, and the whole of the quarter on the left bank of the Usk bears evidence of interments. At Cirencester one inscribed stone is engraved

RUFVS SITA EQVES
TRACVM ANN. XL STIP XXII
HEREDES EXS TEST. F CVRAVE.
IIS E.

"i.e. Rufus Sita, a horseman of the 6th Cohort of Thracians. Aged 40 years. Served 22. His heirs in accordance with his will have caused this monument to be erected. Here he is laid."

Mr. Jewitt has two excellent chapters on Celtic pottery, consisting of sepulchral urns for calcined bones, drinking-cups to go with the dead body, food-offering vessels, and immolation urns to receive the ashes of infants, perhaps sacrificed at the mother's death, and to adumbrate of reposing in the mouth of the larger urns. The most ancient cinerary urns, for flint instruments and calcined bones, were from nine to eighteen inches high. Later ones were much smaller and finer. Of the Roman pottery, the best made in this country was a poor imitation of Samian—brittle, hard, sonorous, and of a lustrous red, like sealing-wax. The Upchurch ware, from potteries on the Medway, was blue, greyish-black, or dark drab, but of shining smooth surface and graceful outline. Durobrivian ware, from the Non in Northamptonshire, is superior to Upchurch, and aspires to rival the Samian ware in its figures and ornaments, which are sporting subjects or gladiatorial figures. The Salop ware was white or light red; the former of elegant shape, but rather coarse texture, the latter of a finer-textured Severn clay. The Anglo-Saxon pottery was chiefly cinerary. We must pass over the chapters on Arms and Armour and on Coins, and can barely glance at the Slabs and Brasses referred to in Chapter VIII. Sepulchral stones, exclusive of the Roman inscribed stones mentioned above, belong to about the seventh and eighth centuries, and are to be found in Cornwall, Northumberland, Wales, and Ireland. A number were found in 1833 on the site of the ancient monastery founded by St. Begu, who gave a name to St. Bees in the seventh century. These will be found discussed at more length in Hubner's *Inscriptiones Britannicæ Christianæ*. Most of these inscriptions are in Runic and Romanesque letters, and bear crosses and symbols having strong resemblance to contemporary inscribed stones in Ireland.

Other chapters deal with the history of Church Bells, a branch of archaeology very popular in this country, and earlier than the coming of St. Augustine; and with glass, stained glass, encaustic tiles, and tapestry. Stained glass in this country dates from the twelfth century; but the manufacture of glass, opaque and transparent, was known in Egypt from three to four thousand years ago. To judge by the glass beads among British remains, it was in early perfection among the Celtic population. In p. 180 of Mr. Jewitt's volume we have a sample of a large dark-green glass mottled bead, or speckled with white; and a variety of Roman beads are to be seen in Plate xxviii. figs. 4-7, of *Iseo Silurum*. One of these is a "Druid's Bead," so called, of rare beauty, so often found in barrows and Roman stations. The last chapter is devoted to the personal ornaments of antiquity—finger rings, Roman and Anglo-Saxon; gimmel rings, signet rings, clasp rings; fibulæ, or brooches, pins and skewers found in barrows; spindle whorls, studs and disks, armlets, torques, combs, &c. The fibulæ of the so-called Anglo-Saxon period are especially interesting because, apart from their workmanship, it is by their varieties that the different kingdoms of the Heptarchy can be distinguished. It is a little odd that, in his ample list of discovered ornaments and toilet articles, Mr. Jewitt omits the strigil, or bath-scraper, which has been found at the site of the Royal Exchange, at Reculver, and at Bartlow in Essex. Mr. Roach Smith, in his *Illustrations of Roman London*, has suggested that this instrument, referred to by Martial and Persius, might be reproduced in our day with benefit to the speculator and advantage to health and cleanliness. Mr. Jewitt's book will, we trust, bear fruit, and be followed by other publications equally useful to the archaeological student.

MINOR NOTICES.

MISS YONGE has written a little book entitled *Womankind*, which, notwithstanding some peculiarities of style and thought, contains many interesting and instructive observations on woman's life at the present day. She begins by avowing her belief in the inferiority of woman as compared with man, and accounts for woman's physical weakness and subordination as a punishment of Eve's transgression. She is also apparently disposed to favour the confessional, if discreetly managed, pleading that the popular objections to confession are founded on stories of priests in foreign countries, who are of a very different character from that of the English clergy. The English clergy, however, have never been exposed to the possible perils of such a system, and there is a strong opinion among people in this country that it would be well to keep clear of the experiment. Miss Yonge herself suggests an objection to the practice when she says, "Of all hateful kinds of gossip one of the most shocking is that about the different ways of confessors; where can the real penitence be if there be levity enough to make such observations?" She has also a leaning to fasting; and entreats heads of families to abstain from Friday parties, and housewives to make it possible for girls to fast at meals without attracting observation; and further, she holds that "a church-woman ought not to suffer herself to become attached to a man outside her own Church." Still she is not at all severe as to ordinary amusements within due limits; she sees no necessary harm in dancing as dancing, or in balls in moderation, nor does she think that theatres or operas, in right measure, need be shunned by those in whose way they would come naturally. Witnessing, or in any way taking part in, the slaughter of animals is stamped as unwomanly; and it is laid down that, as a general rule, all sports which the custom of the time appropriates to men are to be avoided by women. Miss Yonge naturally condemns races; dislikes her sex to go hunting, but would tolerate riding to the meet; and objects to the rink, which, she justly says, is too often attended with circumstances "not favourable to a quiet modest tone among the girls who amuse themselves in very mixed company and in an unguarded manner, making themselves a public spectacle," with "no host or hostess, no one of authority to select the company or act as a check, no one to be accountable." In short, she sets her face against all approach to that feminine fastness which is unfortunately making inroads in society where it would be little expected. She holds that "the custom creeping in of girls enjoying cigarettes themselves," and sitting with men in the smoking-rooms, and "going about alone in London, walking and corresponding with young men, &c.; and all the many daring things that young ladies attempt out of what they are wont to consider innocence, but which is really a spirit of defiance and desire of liberty, excitement, and even notoriety—all these things are, when not exactly perilous, destructive to the gentleness and modesty which—tell us what modernism will—the chief grace of womanhood." This is a painful, but we fear it is unfortunately also too true a picture; and there can be no doubt of the fact that, as Miss Yonge says, "where there has been need of defence, there comes a hardening, and the delicate bloom of perfect modesty must needs be rubbed off." Miss Yonge makes some very sound remarks on dress and on family life; and deplores the signs of increasing insubordination and want of respect for parents on the part of the rising generation. "How many houses," she says, "do we know where the young people rule, and the old people submit; or, if the parents chance to have

strong wills, the next thing we hear is that the girl wants to go into a sisterhood, 'because she can't get on with her mother.' Or the daughters are to be met with at every relation's or friend's house for long visits, while the mother is left at home. And it is well if the young ladies are not taking up courses of which their parents are known to disapprove." The cause of this is said to be the parents' disinclination to enforce their natural authority. "Liberties have been allowed and laughed at, indulgence has been supposed to secure affection, authority has been laid aside, and there has been no habit of submission. The children have learnt to consider themselves the important creatures in the home, and, being entirely educated by strangers, have their minds and opinions cast in different moulds from their parents, and, when their wills and tastes clash, the young ones see no reason for giving way." Altogether, there is much in this work which deserves the consideration both of young and old.

Mr. Duffield's little book * giving an account of a recent visit to the guano deposits of Peru, with "some reflections on the money they have produced and the uses to which it has been applied," presents a graphic picture of the present condition of that country. As to the guano, he states that during the time Peru has been a vendor of it she has sold twenty million tons; and, as the price has ranged from 12*l.* to 12*l.* 10*s.* and 13*l.* per ton, she must have made a very handsome revenue out of this unsavoury article; while the stock of guano still remaining amounts, as he calculates, to between seven and eight million tons. His visits to the guano stations were made after the stones which formerly covered them had, in a great measure, been removed; and he was thus enabled to form a more exact opinion as to the extent of these deposits than was previously possible. Before this uncovering the deposits were conjectured to be as much as four or five million tons; but this did not allow for the space occupied by the underlying rocks. In addition to the supply of guano, Peru has another resource in the nitrate deposits of Tarapaca, which the writer estimates at 70,000,000 tons, and which the Government lately proposed to take into its own hands; but somehow this project broke down, and an attempt is now being made to get up a Company for the purpose. Of the present condition of Peru Mr. Duffield does not speak very favourably. It is a misnomer, he says, to call the Government a republic, for the people have practically no part in its political system; and it is "governed, or rather farmed, by groups or families of despots, who frequently quarrel among themselves." "The Government acts secretly, and no plans are disclosed until they have been accomplished." "Everything is, in fact, secret and underground." On the whole, it would appear that the country has large resources at its back, but that its affairs are at present grossly mismanaged, and probably a revolution is impending. Any one, says the writer, who arrives at Callao, will see the Peruvian Republic in a microcosm—that is to say, "an exhibition of confusion, extortion, bullying, insolence, cruelty, and official imbecility, which cannot be equalled in any other part of the civilized or uncivilized world."

The third volume of the new edition of Mr. Kinglake's *History of the Crimean War*† takes up the narrative at the preparations on both sides for the battle of the Alma, and carries it down to the decision of the allies to adopt the plan of the flank march against Sebastopol.

We have here the first volume—it is a bulky one of 746 pages—of a *Life of Lord Beaconsfield*. by an anonymous writer who, though he has been very industrious in collecting materials, has really nothing to tell which is not perfectly well known before to all who take any interest in the Parliamentary history of modern times. The information given is derived at second-hand from a quantity of miscellaneous publications of various character and value, and contains nothing original or showing any acquaintance with the subject beyond what might easily be obtained from the ordinary external records of public events, eked out by idle and worthless scandal as to private matters. It is, in fact, a narrative composed entirely from outside observation, and without any of that intimate personal knowledge and insight which constitute the essence of genuine biography. Moreover, the writer has not the calm and judicial, any more than the thoroughly informed, mind which is required for such a task as he has undertaken. He writes in a spirit of spiteful and prejudiced antagonism, which shows his incapacity to give a fair summing up either of political character or policy. Lord Beaconsfield's public career has no doubt been one which in some of its aspects affords considerable temptation to unfavourable criticism; but a just estimate of his public services demands a candid and impartial examination. For these reasons, the present work cannot be regarded as a trustworthy history. It is, in fact, a mere raking up of old stories, the significance of which has long been exhausted, and which might now well be forgotten.

A new edition of Sir Edward Creasy's *History of the Turkish Empire*§ has been provided to meet the general desire for information on this subject at the present time. It gives a comprehensive view of the chief events in Turkish history from the first appearance and exploits of the Ottoman Turks under Ertoghrul in

§ *History of the Ottoman Turks.* By Sir Edward S. Creasy. Richard Bentley & Son.

Asia Minor down to the present day. The book, as the author mentions, is chiefly founded on Von Hammer's elaborate researches, but a large number of other authorities have also been consulted; so that it is a valuable digest of the best information.

A selection of the poems of the late Mr. Thomas Hood, or Tom Hood*, as he was more commonly called, with a brief sketch of his life, has been issued as a memorial which will no doubt be appreciated by his friends. Beginning life as a clerk in the War Office, he applied his leisure hours to literary work, and afterwards gave himself up to it exclusively, both in the way of original writing and editing. He seems to have been, as we gather from his sister's memoir—and his verses suggest the same impression—of a simple, kindly nature, not aiming beyond his powers, and contented with his position, though it was a modest one both in income and reputation. His father's fame was rather a disadvantage than otherwise to him, for it suggested a degree of humour to which he could not aspire, and exposed him to an unfavourable comparison. However, he seems to have worked earnestly and industriously within the limit of his powers; he was hardly a poet, but he could run off merry rhymes, which made him a friend of young readers.

The deserved favour with which Mr. Henry Blackburn's annual record of the Royal Academy Exhibitions has been received has led him to bring out a similar publication illustrative of the pictures in the National Gallery.† Of this work the first part—relating to the British School—has just appeared. It gives a description of every picture in the eight rooms, and, as far as possible, in its order on the walls; and in the case of the more important works a small, but very accurate and spirited, reproduction of the original, the aim being, as the author says, to record the composition of pictures for the use of students, and for reference by those who have not had an opportunity of visiting the National Gallery. These illustrations are produced by the Typographic Etching Company. Although the nature of such a work renders it impossible to make it a perfect representation of the collection, it has a value of its own, as an agreeable and instructive memorial of the Gallery, which helps to revive the impressions formed during a visit, while it affords a good idea of the pictures to those who have not seen them. The landscapes are, of course, difficult subjects for this kind of treatment, but they are delicately done, and supply a distinct impression of the outlines and grouping of the scene. In the case of the figure pieces it is really wonderful how much effect is compressed into these little engravings.

These are certainly strange times. A publishing firm has just brought out what is called, oddly enough, *The Leopold Shakspeare*‡, apparently under the impression that nowadays Shakspeare's name by itself will not sell his works, but requires adventitious support. An amiable young prince has therefore been persuaded to shed upon the poor bard the lustre of his distinguished patronage; and Mr. F. J. Furnivall, who seems to be under the impression that the main object of Shakspeare's existence as a dramatist was to furnish himself and other commentators with materials for all sorts of fantastic dogmatizing about the plays, supplies a long prefatory notice. Most people however will, we imagine, think that Shakspeare can stand very well on his own merits, and does not need either patronage or idle commentary. It has also been thought necessary to go to Professor Delius, one of the German luminaries, for the proper text of the works of the great English poet, just as if he had been annexed like Alsace, as well as for an arrangement of the plays in "a conjectural chronological order," which simply comes to this—that he sets aside the dates of the plays as far as they are on record, and substitutes a theoretical account "of the growth and working" of the poet's "art and genius" out of his own fancy. Another feature of the volume is that it includes *The Two Noble Kinsmen* and *Edward III.*, which have hitherto generally been regarded as not really Shakspeare's work.

In putting together some biographical sketches of celebrated violinists § Dr. Phipson takes the opportunity of protesting against the way in which "ignorant and vulgar-minded persons" confound violins with fiddles, as if they were just the same. The fiddle is a coarse, common instrument, costing only a few shillings, whereas no violin worthy of the name, in the Doctor's opinion, can be had for less than from five to ten pounds; while for a good solo instrument from twenty-five to fifty pounds is the lowest price. Among the eminent performers of whom an account is here given are Lulli, Corelli, the Bannisters, Tartini, Viotti, Paganini, Ole Bull, and various contemporary violinists, such as Ernst, Joachim, Vieuxtemps, Sainton, &c. and some of the stories told of them are very interesting. The Bannisters used to play at the house of Thomas Britton of Clerkenwell Green, the small-coal man who in the day cried his sacks about the town for sale, and in the evening entertained the *dilettanti* of London in a small room over his shop, where he and some of his friends played the violin. All newly-arrived players were eager to appear there. Tartini, who made the discovery of the "third sound," was also, it need hardly be said, the composer of the famous *Trillo del Diavolo*. Paganini, whose strange appearance is well known, had become a tolerable

violin-player at six years of age, and at nine played at a concert where he was very successful. At thirteen he began to write music for the violin, and soon acquired a great reputation throughout Europe. His first concert in London was given at the King's Theatre in 1831, and was attended by a most enthusiastic audience, which screamed with astonishment and delight at the novelty of some of his efforts. It is satisfactory to learn that, as a rule, a good violinist must be a man of high moral and intellectual character.

The Clothworkers' Society has published a Report* by Mr. W. McLaren and Mr. Beaumont, two competent inquirers, into the working of the weaving and other technical schools of Belgium, Germany, and France, which contains useful information.

Mr. John Christian Schetky, late marine painter in ordinary to the Queen, and well known as a professor of drawing in naval schools, is the subject of a simply-written memoir by his daughter.† He was a descendant of Baron Wenceslas von Teschky, who, having through persecution been dispossessed of his estates, transposed the letters of his name, and became plain Herr Schetky. His father, John George, was the eldest son of the secretary of the Landgraf of Hesse-Darmstadt, a good violoncellist and composer, who, happening to go to Edinburgh to play at a concert, and finding the habits and climate of the city suit him, settled there for life. John Schetky was his fourth son, and early showed a love of the sea. Indeed, he was to have entered the navy, and was booked to a ship; but his parents changed their minds, and he had to be content with attaching himself to the service as a marine-painter. He became Drawing Professor at the Royal Naval College, Portsmouth, and some years afterwards at Addiscombe College; in 1815 he was appointed "painter in water-colours" to the Duke of Clarence, and four years later the Prince Regent made him "marine-painter in ordinary." He seems to have been a clever artist, and ready to turn his hand to anything; but his favourite subject was ships. He probably also owed much of his success in life to his geniality, good-fellowship, and the singing of sailors' songs. He seems to have been very popular in the navy. He moved about a good deal in all sorts of society, with occasional trips abroad; but it can hardly be said that there was anything very remarkable in his life, except the number of bodily accidents which happened to him from his youth upwards, of which the following enumeration is given—being all but drowned in a muddy pool and swallowing lots of tadpoles; being still more nearly drowned in a deep river; falling against a fishwoman and spraining his ankle; falling over the head of his horse; fracturing his knee-cap by hitting it with a cricket-bat; being run over by a carriage-brake; being upset in a boat at Oxford; dislocating his collar-bone by a tumble over a slack rope in the dark; breaking it over again on board the *Victory*; having another fall and hurting his knee-pan on the *Resolution* yacht; being upset in an open carriage; run away with in a carriage; getting his right leg fractured on the yacht above-mentioned; jumping through a window (unadvisedly), and getting his head cut. "And that's all," he winds up, "that I can remember for the present." This was in 1860. Before his death, however, he had at least two more bad falls in close succession; but "the cheerful contentment of a life-time did not desert him." He died in 1874.

A knowledge of the Turkish language seems to be just now very much in requisition; and Mr. Hopkins has brought out a handy elementary grammar‡ of it, with a few easy exercises, which we should think very suitable for beginners. Mr. Edwin Arnold has also compiled "a simple transliterated" grammar§ of the language from various sources, with dialogues and vocabulary.

Mr. Todhunter has produced a manual for beginners in the study of natural philosophy|| which he succeeds in making simple and easily understood, yet adequately full for a general understanding of the subject. The present volume comprises four parts, and treats of the mechanical properties of solid and fluid bodies. The second volume, completing the work, will deal with what Dr. Whewell called the secondary mechanical sciences—those relating to sound, light, and heat. The author is certainly justified in hoping that the early student will here find a satisfactory foundation for his future studies, so that, though he may have something more to learn, he will have nothing to unlearn.

Mr. Crump, in the new edition of his *Key to the London Money Market*¶, brings the work down to the latest date. It contains an introduction giving an account of the fluctuations of the money market, the economization of capital, the system of allowing interest on deposits, the circulation of paper money, and so on; a chronicle of important circumstances which have affected the market; and the Bank of England returns from 1792 to 1876 inclusive, together with some new tables containing the separate totals of the bills discounted by the Bank of England, and the advances, the Exchequer balances, and the London bankers' balances for

* Report to the Clothworkers' Company of London on the Weaving and other Technical Schools of the Continent. By W. S. B. McLaren and John Beaumont. Rivingtons.

each week during 1857-76. The percentage or proportion of reserve to liabilities is also recorded.

Mr. Wilson's series of tables* showing the highest and lowest prices of every security will be useful to those who are interested in Stock Exchange transactions.

Mr. Worthington Smith's little shilling handbook telling how to distinguish between edible and poisonous fungi† has reached a third edition, and has, it may be hoped, saved many persons from the risk of a fatal mistake. The illustrations are good; but it would have been worth while to have had them coloured, even at an increase in price.

A new edition of Mr. Redhead's manual of Church song, consisting of the Prayer-Book services‡ for morning and evening, with musical notation, has appeared, with considerable additions and improvements.

Mr. Watts, who confesses to a passion for Icelandic travel, has written an account of a recent journey through some hitherto unexplored parts of the country, including an ascent of the Vatna Jökull§ and a visit to the northern volcanoes, with a view to showing that, though the general aspect of nature in that region is dreary and wild, there is plenty to reward a man of scientific and athletic qualifications for the hardships he has to go through. There can be no doubt that the author himself thoroughly enjoyed the hard work and rough living; but his narrative certainly gives an impression that travel in Iceland is rather monotonous in regard both to scenery and incidents.

Mr. W. G. Walker has reprinted the Acts of 1868 and 1876 relating to suits for the partition of estates||, along with a comprehensive statement of cases, and of the general effect of the law as it stands.

Mr. Hiley has edited another of those text-books of poetry¶ which tend to deaden all sense of poetry by dull and irrelevant pedagogism. It is supposed that a boy capable of understanding Byron requires to be informed that a gazelle is "a species of antelope"; that the "moping fits" of the Childe can only be elucidated by a reference to Gray's *Elegy*; that a certain rough expression applied by Byron to the Church of Rome is from the Book of Revelations; that

Here Folly dashed to earth the victor's plume,
And Policy regained what arms had lost,

needs to be explained by prosaic details of the negotiations referred to. It may be true that "pride of place" is "an expression from falconry," but it is surely enough to take it as a pure poetical phrase; and why should any boy be pulled up at "antithetically mixed" in order that the editor may solemnly remind him of "marvelously mixt" in Young's *Night Thoughts*? Again,

Of its own beauty is the mind diseased,
And fever into false creation—where,
Where are the forms the sculptor's soul hath seized?
In him alone—

surely does not need to be expounded by such stupid verbosity as, "Nature in her actual beauty never attains to ideal perfection. The Paradise which may be the offspring of our despair passes the power of pen and pencil to delineate." This sort of thing is kept up on every page; and it may be easily conceived that the pupil can have little idea of the flow of poetry when his attention is constantly drawn off from the text by such idle and distracting interruptions.

Mr. Glaister has translated the Life of the Emperor Karl the Great **, written by Eginhard, who was his secretary and private chaplain, and his constant counsellor and companion. The Life was written in Latin and did not exceed more than forty pages, yet it is said to have been the chief literary production of the age. Mr. Glaister supplies an introduction and notes.

Mr. Wynnard Hooper has prepared a revised and corrected edition of Mr. Swan's translation of the popular story-book of the middle ages, known as *Gesta Romanorum*††, which was published in 1824. Mr. Swan did not profess to give a literal translation, but took many liberties with the text; which the revising editor thinks he was entitled to do, considering the loose and careless style of the narrative, though he did not always do it discreetly. Mr. Hooper has therefore gone over the work, adopting it where there was no departure from the old text, restoring passages of importance which had been omitted, and correcting errors in translation. A German writer, Hermann Oesterley, has thrown a good deal of light on the origin of this curious collection of tales; and Mr. Hooper has given a pretty full summary of his conclusions. Douce had a theory that some of the original manuscript of the *Gesta* might be discovered in some of the stores of papers in the monastic and other libraries of Germany, Switzerland, and

* *Stock Exchange Prices*. Effingham Wilson.

** *Life of the Emperor Karl the Great*. Translated from Eginhard. By W. Glaister. Bell & Sons.

†† *Gesta Romanorum; or, Entertaining Moral Stories*. Translated from the Latin by the Rev. C. Swan. Revised and corrected by Wynnard Hooper. Bell & Sons.

Italy and Spain; but Oesterley states that, after extensive researches, none has been found. The *Gesta* consists of 181 stories, which were first printed about 1473, but which was previously in circulation in a manuscript form, with many variations of text. There was also in England a collection of some of these stories in Latin; and Oesterley admits that it is possible that the collection was of Continental origin, but thinks it probable that it was compiled in England, and thence passed to the Continent, where it was continually altered by additions and corruptions. His theories as to the author of the work are purely negative; that assigning it to Berchorius, the Prior of St. Eloi, being pronounced unproved, and the claim of Helinand equally doubtful. It is also one of his conjectures that at some early period there were collections of stories taken from Roman history in actual use as texts for sermons; and that these were afterwards brought together in order to provide materials for moralizing, the stories being regarded as of only secondary importance, though afterwards they became the chief part, and the moralizing went into the background. In spite of the title which the work bears, it contains, in the form in which it has come down, very little matter really relating to Rome, though the collector, in introducing these stories, prefaces almost every one with the name or reign of a Roman Emperor who in many cases never existed, or had no connexion with the circumstances of the story. Thus in their origin they were probably classical fictions, but were resolved into allegory to suit the purposes of religion. Taking the *Gesta* generally, though they have a curious interest as records of manners, and have sometimes a quaint humour, they are very dull reading, and most people, we fancy, would soon get tired of them.

THE COMING WAR.

AMONG the reasons which induced Lord HARTINGTON and Lord GRANVILLE to call attention to the late negotiations, a judicious desire to anticipate less discreet politicians may probably not have been wholly inoperative. It was at the same time, according to Parliamentary ethics, a legitimate object to prove that the Government had been altogether or partly in the wrong. Lord HARTINGTON'S censures of the conduct of affairs were stronger than those of his colleague in the House of Lords; but it may be doubted whether the leaders of the Opposition are not content with the fortune which left to their rivals the duty of dealing with an insoluble problem. The interest which attaches to retrospective criticism becomes every day fainter. It may be hoped that the question whether it was well to reject the Berlin Memorandum in the spring of 1876 has been raised for the last time by Lord GRANVILLE. Impartial students of the Blue-books have probably arrived at the conclusion that there was never any chance of persuading either Russia or Turkey to listen to the counsels of England. Lord DERBY, while he disclaimed the authorship of the Protocol, justly observed that, if it had been expressed in stronger language, it would have been still more unacceptable to Turkey; but the truth is that none of the documents which have, during a year and a half, embodied attempts at compromise have practically influenced the course of affairs. The ANDRASSY Note, which was the first of the series, was after a short hesitation signed by all the Powers, and, unlike all succeeding instruments of the same kind, it was immediately accepted by the Porte; yet neither the Berlin Memorandum nor the ultimatum presented by the Conference proved to be more absolutely ineffectual. Turkey has throughout refused to submit to dictation, and Russia had probably many months ago determined on war. The English Government, having rightly or wrongly resolved to maintain entire neutrality, could not restrain ambition on one side or obstinacy on the other. The result of the Conference dispelled the feeling or fancy that the Porte was only encouraged to resistance by confidence in the support of England. The guarantees which were unanimously proposed by the six Powers were rejected with as little hesitation as if they had proceeded exclusively from Russia. The hope which was still faintly entertained of acting on the prudence or moderation of Russia has been not less completely disappointed.

It could not be expected that in either House the leaders of the Opposition should pass over in silence the supposed errors of the Government, especially as they are all attributed to a systematic policy; yet the general impression produced by the debates both in the Lords and the Commons is that the discussion is essentially idle. It is impossible to believe that peace or war depended either on the wording of the Protocol or on Lord DERBY'S Declaration. The English Government may have had good reasons for scrutinizing narrowly the terms of the document which was tendered for signature; and if a mistake was made, it consisted rather in the vague and elastic character of the pledges which were given than in the omission of still more binding covenants. The Declaration, or conditional defeasance, had the merit of placing on record the motives which induced the English Government to undertake any kind of obligation. It was distinctly understood by all parties, and it was plainly stated by Lord DERBY, that the Protocol was accepted for the

sole purpose of facilitating the disarmament of Russia and Turkey. When the negotiations were concluded, all the Governments, with the exception of Russia, supposed that, whatever might be the merits or defects of the Protocol, peace had been patched up for a time. If the Government of St. Petersburg had thought fit to use conciliatory language, the Porte would in all probability have gladly made concessions for the purpose of escaping from a dangerous situation. The overbearing and menacing tone of Prince GORTCHAKOFF'S communications produced, as might have been expected, the opposite effect. It is absurd to assume that a different form of Protocol, with or without an accompanying Declaration, would have altered the decision of Russia. The English Government, whichever party it might have represented, had only two courses between which it could choose. The theory of joint coercion may be recommended by plausible arguments; but, if it is once rejected, the only alternative was to remain neutral, and to try, with or without success, to hinder or delay by diplomatic methods a Russian declaration of war. It is a waste of time to criticize the details of a negotiation which it was always in the power of Russia to render abortive. Lord DERBY'S statement on Thursday night was satisfactory in as far as it furnished an almost superfluous confirmation of the certainty that England will not take part in the defence of Turkey. His intimation that war is inevitable will have dispelled no existing doubts, although Russian journalists strangely affect to assume that there is still a possibility of peace.

The Emperor of RUSSIA and his advisers are exclusively responsible for the war which they have deliberately prepared. The policy of aggression could only have been checked by a union of the Great Powers which was in the actual circumstances impossible. The Russians have achieved the diplomatic triumph of thwarting Lord DERBY'S laborious efforts to preserve peace; and, if they have leisure for the study of English debates, they may perhaps take pleasure in the comments of the Opposition on the alleged blunders of the Government. It is nevertheless not improbable that the Russians would willingly exchange positions with the opponents or backward allies whom they have easily baffled. The advantages of their present enterprise may perhaps be considerable; but they can only be attained at the cost of heavy sacrifices. That the Turks cannot finally repel the invasion of a greatly superior force may be confidently assumed; but General FADAEFF, who has lately arrived with or without a diplomatic commission at Belgrade, long since explained to his countrymen that any conquests which they might effect in Turkey would be held only by the permission of Austria. The able advocate of a Slavonic crusade proceeded to draw the logical inference that the first effort of the Russian forces should be directed against Austria and Hungary; but no such policy is at present contemplated by the Russian Government, and the alliance of the three Imperial Governments still nominally subsists. In two or three weeks the impediments which the weather has placed in the way of an advance will have been removed, and the Russian army will effect an unopposed march from the Pruth to the Danube. As long as the Turkish fleet commands the Black Sea, all stores and munitions must be conveyed by land, without the aid of railways. The passage of the Danube will offer no serious difficulty to capable generals in the command of a superior army, and the next step will be either to besiege or to mask the Turkish

fortresses to the south of the river. It is doubtful whether there will be time to cross the Balkan during the summer and early autumn, and in the winter active operations must be suspended.

The obvious drawbacks to the benefits which the Russians might derive from victories in European Turkey have induced many political and military theorists to conjecture that their more serious operations will take place in Asia. Since the time of the Crimean war the conditions of an Asiatic campaign have been changed or reversed by the conversion of the Caucasus from a barrier against invasion to a basis for aggressive movements. The strength and the destination of the Russian army on the Eastern frontier of Turkey are entirely unknown; and it is possible that large detachments from the Grand Duke Nicholas's army may have been made without attracting attention. It is almost certain that the Turks have drawn the greater part of their disposable forces to the European theatre of war, and they will offer a comparatively feeble resistance to the enemy in their Asiatic provinces. In that quarter there is no neighbouring Power which can in any event deprive Russia of the fruits of victory. Even Persia is more likely to seek for a share in the spoils of Turkey than to assist a Mahometan neighbour; and the conquered tribes of Central Asia, though they would perhaps willingly revolt, will not be formidable enemies to Russia. By overrunning Asia Minor Russia might perhaps take possession of some seaport on the Mediterranean which would turn the obstacle of the Straits. The temptation of effecting easy and permanent conquests will be strong; but perhaps the Russian Government may be embarrassed by its professions of religious and national sympathy with the Christians of European Turkey, who would have no interest in Asiatic triumphs. Altogether, the authors of an unnecessary war are not to be envied. The expenditure which has already been incurred will long weigh heavily on the resources of the Empire; and it is said that large numbers of workmen have been dismissed from employment in consequence of the stagnation of industry. Great efforts will be made to sustain the national credit; but it may be doubted whether, in the contingency of a long war, it will be possible to pay interest on the debt. It is strange that the philanthropists of the Peace Society abstain from noticing a striking illustration of their doctrines.

THE SALFORD ELECTION.

THE Salford election has excited considerable interest, as its result was thought likely to show whether the Government had really lost ground in the constituencies. The electoral body numbers over twenty-two thousand, and the borough is not only in Lancashire, but is close to Manchester, so that the opportunity was offered for testing the popular judgment on a large scale and in a great centre. Mr. GLADSTONE and Mr. BRIGHT wrote to say that they felt the keenest interest in the issue, and many Liberal members went down to make as exciting speeches as nature or art enabled them to make, and to testify that the eyes not only of England, but of Europe, were fixed on Salford and its election. It was a fight between parties, not candidates. Mr. KAY, the Liberal candidate, was too ill to be present, and Colonel WALKER honestly owned that he could not speak, and contented himself with repeating that he was a Conservative, thanking heaven that he was not a lawyer, and apologizing for himself and his name. Most of the speaking was therefore done by the Liberals, and worse speeches have perhaps seldom been made. Theoretically the electors of Salford were regarded as persons of extreme and extraordinary intelligence; but practically it was considered that there was nothing too silly to be said to them. It is of course quite proper for Liberals to abuse Conservatives during an election time, but there ought to be some measure and method in the abuse. A favourite topic was the coincidence of the reign of a Conservative Government with bad times for trade; not that one was exactly the cause of the other, but, as a poetical speaker put it, they were birds of evil omen that appeared together. The extravagance of the Government was naturally denounced, as it is an axiom of Liberal politicians that all Conservative Governments are inherently extravagant. The appointment of Lord HAMPDEN was once more dug up as a proof of financial recklessness; and, if he should read what was said of him, which is not probable, he would have the

pleasure of finding himself described as a useless old back, provided for by a flagrant job. Mr. TREVELLAN was among the Liberal speakers, and he has too much ability to make any speech that is entirely rapid; but even he seems to have been overpowered by the air of Salford, and condescended to tell a tale of a visit he made in Kent lately, when he was asked to speak to a chance meeting of agricultural labourers. He owns that, being thus suddenly called on, he had nothing in particular to say; but he produced so great an effect on his audience, the labourers listened to him with so much rapt intelligence, and their honest faces beamed with so divine an intellectual light, that he was quite awestruck with horror at the thought that such men, so noble in themselves and so interested in what he said, should not have a vote for their county. When speakers inferior to Mr. TREVELLAN occupied the time of the many meetings held on either side, issues were raised and gravely debated which seem remarkably small for a place of such intelligence as Salford. Mr. CHARLEY, for example, the sitting Conservative member, entered with much zest and animation into the question of the comparative merits of the law books which he has written and the law books which Mr. KAY has written, and he pronounced warmly in favour of the superiority of his own compositions. For such very clever people as the electors of Salford are said to be, there is an air of Batonswill about their election contests which is a matter of some surprise.

There were, however, two points of wide and general interest raised at Salford on which the electors, by returning a Conservative, may be taken to have pronounced an opinion. The first was whether a Liberal is to win a seat by pandering to the crotchets-mongers, and the second was whether the Eastern policy of the Government deserves to be condemned. Mr. KAY went into the deepest depths of trimming. He bid high for the Home Rulers, and equally high for the teetotallers; and he was rewarded with a certificate from Mr. BUTT and a vote of approbation from the Temperance Association. As things turned out, he made a bad bargain, and lost more through the disgust of waverers than he gained through his pliancy to strange supporters. Mr. BUTT's certificate was to the effect that Mr. KAY was ready to support the proposal for a Committee of Inquiry into the claims of the Home Rulers and for the immediate release of the Fenian prisoners, and further to vote straight on Irish questions generally. It may be true that even this amount of wild facility did not enable him to catch the united Irish vote, as some at least of the Irish may be rather Catholics than Home Rulers, and may think more of revenging the wrongs of Poland than of setting up a Parliament where Mr. PARFELL and Mr. BIGGAR would talk on for ever. But, if the undivided Irish vote had been polled for Mr. KAY, he would probably have alienated more voters than he attracted. No issue can be plainer and more simple than that which Home Rule presents. It is the issue whether the British Empire is to be broken up or not. An Englishman may honestly think that even this consequence ought to be faced, and that the Irish claims to have the Empire broken up for their amusement are morally so strong that to contest them is wicked. But, if he thinks so, he ought to say so. The controversy has long since reached a point which makes it impossible to say that any further inquiry is needed. The matter has been thoroughly argued out, and the Liberal leaders have taken quite as decided a position with regard to Home Rule as the Conservative leaders. No one can be more frank and hearty in his opposition to Home Rule than Lord HARTINGTON; and if Mr. KAY so demeaned himself as to get a certificate of good behaviour from Mr. BUTT, he separated himself as distinctly as he could do from the leader of his own party on a vital question. The calculation which a Liberal candidate may be tempted to make, that if he does trundle a little to the Home Rulers he will not do much harm, as the opposition of his own leaders, joined to that of the Ministry, makes the project of Home Rule a baseless dream, is one which the thought of human weakness may excuse, but the appearance of which shocks simple-minded electors, and degrades the candidate himself and the party to which he belongs. So widely is this felt that quite as many Liberals will be pleased that a candidate who got a certificate from Mr. BUTT has been defeated as sorry that a seat has not been wrested from the Conservatives. Mr. KAY obtained the support of the Temperance Association as the price of promising to vote not only for Sir

WILFRID LAWSON'S Permissive Bill, but for the entire closing of public-houses on Sundays. It is not perhaps astonishing that a programme of "No beer and BIGGAR for "Speaker" did not approve itself to the astute intelligence of Salford.

As there were two issues to be decided, it cannot be said on which the result of the election really turned. The electors may have cared more about beer and Home Rule, or they may have cared more about Turkey. But at any rate they did not think the Eastern policy of the Government so wrong that they were willing to send a nominee of Mr. BUTT and the Temperance Association to oppose it. The Liberal members who spoke at Salford drew a distinction between the Ministry and its Parliamentary supporters, and said, what is incontestably true, that many Conservative members are much more intemperate and foolhardy than the Ministry itself, and would gladly plunge the country into a war with Russia. The tone of the House of Commons is very anti-Russian, and the Turks are openly admired for baffling the well-meant projects of Lord DERBY; and it was to curb this feeling that the electors of Salford were invited to send a Liberal to the House of Commons. But electors at a distance cannot go into these refined distinctions. They naturally look at what the Government has done, and ask themselves whether it is to be blamed or not. The only practical question is whether the nation is to be dragged into a war for any other purpose than the protection of British interests. It is difficult to see how any one could have a clearer opinion on this head, or express it more strongly and pertinaciously, than Lord DERBY. He has told the Turks throughout, and he repeated the statement on Thursday night, when war was known to be unavoidable so far as human foresight can go, that the Turks are not to have any assistance from England. He went, indeed, on Thursday much further than he has ever gone before, for he asserted not only that neither France nor Austria would ask England to put the Treaty of 1856 into effect, but he reserved for England the right in any case to consider whether the treaty had not become, as all treaties are liable to become, obsolete by the lapse of time and the change of circumstances. A remark which Russia would more gladly welcome from the lips of an English Foreign Secretary could not be imagined. That the electors of Salford were in favour of leaving Turkey to its fate, whatever that fate may be, was clear, for as to this both sides were agreed; but this way of looking at things did not create any ground of antagonism to the Ministry, which proclaims energetically that it is precisely of the same opinion. The notion that the Ministry may be overturned by its own supporters is a very visionary one, and those who entertain it fail to take into account both the admirable discipline of the party itself and the probability that the more noisy and unruly Conservatives in the Commons may have something of the same feeling which actuates the friends of the Home Rulers, and may calculate that they cannot do much harm when their own leaders and the Opposition are there to prevent the expression of their sentiments having any practical effect.

THE BUDGET.

THE modest Budget of the present year has offered little encouragement to financial theorists. When the CHANCELLOR of the EXCHEQUER could neither remit nor modify the most insignificant tax, elaborate demonstrations that any part of the fiscal system ought to be readjusted can excite but little interest. Captain NOYAN might think himself fortunate in raising a short debate on his plan for an exemption of a fixed portion of every income from taxation. The plan has been often suggested, and it presents a certain show of symmetry; but it would be absurd to relieve the owner of 1,000*l.* a year from a burden amounting to 12*s.* 6*d.*, while the deduction would sensibly affect the public revenue. The exemptions introduced by Sir STAFFORD NORTHCOTE last year were arbitrary and perhaps anomalous, and it is generally agreed that it would not be wise to proceed further in the same direction; but the rough-and-ready mode of relief had the merit of being extended only to the owners of small incomes, or to the poorer section of the middle class. A fixed allowance on incomes large and small would produce no appreciable diminution of discontent. The time is not less unpropitious

for inquiries into the distribution of public burdens. Mr. ANDERSON holds the apparently paradoxical opinion that the poorer classes have within the last few years been subjected to an increased proportion of taxation. If the proposition were established, it would still be impossible to alter the present Budget for the purpose of redressing the supposed inequality. Even if the question were discussed with a practical object at some more convenient time, there is but little chance of a further reduction of duties on consumption, especially as it would necessarily involve an increase of direct taxation. It is possible that, after all the reforms which have been effected in the tariff, the working classes may still contribute more than their due share to the national treasury; but almost the only taxes which they pay are additions to the cost of the beer, the spirits, and the tobacco which they consume. A reduction of the duties on some of these popular luxuries would be almost universally disapproved. It might indeed be well if beer could be cheapened; but both producers and consumers have for some time past discontinued the agitation against the Malt-tax. No Finance Minister is likely to have the whole amount of the tax to spare, and a partial reduction would scarcely affect the retail price of beer.

The economists of a former generation were more fortunate than their successors of the present day in opportunities of denouncing fiscal abuses. Forty years ago the great majority of taxes were demonstrably mischievous, even if the immediate loss to the taxpayer had been put out of consideration. Industry was impeded in innumerable ways; and some imposts, such as the Window-tax, inflicted great injury on the community by affecting personal comfort and health in cases where the tax was evaded. Sir ROBERT PEEL and Mr. GLADSTONE, with some Finance Ministers of less eminence, have gradually removed all glaring hardships and inequalities. It is perhaps because absolute symmetry of taxation seems no longer out of reach that amateur financiers from time to time propose theoretical approximations to their own standard of perfection. The Income-tax has long been the favourite subject of ingenious reformers. Even the crude notion that a distinction ought to be drawn between incomes of longer and of shorter duration from time to time finds utterance in the House of Commons. Chancellors of the Exchequer, having perhaps no inclination to spend their time in teaching the rudiments of economic science, always meet objections by the vague statement that it is impossible to attain perfect equality. The ancient controversy seems likely to die out for want, not of financial theorists, but of a popular audience. The class which was disposed to clamour against the tax has been bought off by liberal concessions of differential rates and exemptions. It is but dull work to expound the grievances of injured classes which are themselves perfectly contented. If Sir STAFFORD NORTHCOTE or any of his successors become sufficiently prosperous to restore the percentage of two years ago, and to avoid further changes, they will hear little more of the anomalies of the Income-tax. The consumers of tea, of currants, and of a few other commodities which are still liable to Customs duties are scarcely conscious of the artificial addition to the price. One instalment of the free breakfast table has been realized by the abolition of the sugar duty; but it is improbable that tea will for many years be admitted free. If consumption must be taxed, duties ought, as in the case of tea, to be confined to articles which cannot be produced at home. The whole amount of the tax is received by the Treasury, and no tribute is paid to protected producers. In the case of tobacco, legislative prohibition effects the object which in the case of tea or wine is attained by natural unfitness of soil and climate.

The only malcontents who have expressed serious dissatisfaction willingly admit that no redress can be expected until the CHANCELLOR of the EXCHEQUER is once more in possession of a surplus. The Railway Companies have the advantage of a Report of a Committee in their favour, although Mr. ASHLEY'S speech shows that the members were not unanimous. Sir STAFFORD NORTHCOTE gives little encouragement to prospective demands for relief; and the House of Commons always regards with leniency any special tax which is imposed on a limited section of the community. The brewers are treated with almost deliberate injustice because they are few in number; and also because they are supposed as a rule to be rich. Railway shareholders are sufficiently numerous, and for the most part they are far from rich; but still they form a minority;

and they are often regarded, not in their separate capacity, but as constituent members of large and wealthy corporations. In spite of accepted economic principles, it is generally taken for granted that no part of the tax falls on the consumers or railway passengers. One immediate cause of the agitation against the tax was extremely irritating. It was discovered, after many years of acquiescence on the part of the Government departments, that a legal objection might be raised to claims for exemption, which had been allowed to the Companies. The tax was not leviable on trains which traversed the whole line of a railway, stopping at every station, and paid for at the rate of not more than a penny a mile. In course of time the Companies, greatly to the benefit of the working people, improved the speed of the trains; and it appeared by a judicial decision that they had forfeited their exemption. In taking advantage of the result of an oversight, the Government contended that cheap trains had become unexpectedly profitable; but a tax which is levied in virtue of a subtle interpretation of an enactment which had been intended to produce an opposite result is not satisfactory. The unexpected operation of the law would have been corrected if it had not affected Railway Companies, which have for some mysterious reason incurred the ill will of the House of Commons. The special Income-tax on a large portion of their earnings will almost certainly be maintained; but Sir STAFFORD NORTHCOTE intimated an intention, not of giving the tax away, but of selling it to Companies which might be inclined to give equivalents in the form of accommodation. In the meantime, the monopolists who are constantly denounced by writers and orators must in some cases submit to pay away more than their whole income in the form of passenger duty. The Companies some years ago prudently declined a commutation which was offered by Mr. LOWE. An extension of the duty to goods traffic might have afforded relief to the Southern lines, which depend for their receipts chiefly on passengers; but it would have been indiscreet to establish the principle of indiscriminate taxation of railway traffic. The discussion, which is not of primary importance, illustrates the exaggerated character of the popular belief in the power of Railway Companies. Directors and shareholders, though they are absolutely unanimous in denunciation of the tax, cannot obtain a hearing.

RUSSIA AND THE UNITED GREEKS.

A SERIES of papers has been presented to Parliament illustrating the curious but effective manner in which the Russian Government deals with religious difficulties. In a part of Russian Poland, near the Galician frontier, there has dwelt from time immemorial a population of United Greeks—that is, of persons who at the time of the rupture between the Eastern and Western Churches placed themselves in communion with the latter, but retained the rites and usages of the former. A series of Papal Bulls have been issued at different dates, commencing from the end of the sixteenth century, by which the liberty of these members of the Romish Church to preserve their Greek rites has been guaranteed. But the United Greeks are in many districts scattered among the Polish Catholic population, and for many years a process went silently on by which Romish rites were introduced and the Greek rites were supplanted. The peasantry were attracted by the more gorgeous ritual of the Latin worship, and the landlords—Poles and Catholics—were eager to use their power as patrons of incumbencies to fill the United Greek churches with priests inclined to approach as nearly as possible to the Latin rites. After the Polish insurrection of 1863 the Russian Government decided to stop this process of gradual conversion; for the United Greeks in question are Russians, not Poles, and the Government saw with anxiety this slipping away of a Russian population out of its hands. The higher clergy of the United Greeks sided with the Government, and the lower clergy either followed the example of their superiors or else were summoned before commissioners who asked them their views as to the comparative merits of Greek and Latin rites, and, if the answers were not satisfactory, suspended or banished them. Before long all the United Greek clergy of the district were pledged to uphold the restoration of the pure Greek rite, and it was ordered by the civil and religious authorities that by a

given day the traces of the Latin worship, such as organs and Polish chants, should be altogether swept away. But the congregations rebelled. They had got accustomed to the Latin rite, and claimed that, as their fathers had heard an organ, they might hear one too. The means they took to express their sentiments were of a very practical kind. They attacked their own priests and stoned one to death. Then the military were called in, and the peasants attacked the military. The military retaliated. Some peasants who were actually attacking the soldiers were shot. Others who were in possession of a church into which they refused to admit their priest were flogged, one very vehement woman receiving one hundred lashes. On a much larger number who were in a state of chronic rebellion Cossacks were sent to live, and they were eaten out of house and home. It was only about a tenth part of the Greek population that offered open opposition to the authorities; but this part was very firm, and for a period of two years there was what may almost be termed an agrarian war in the disturbed district. If the soldiers were caught when they could not protect themselves they were waylaid and murdered, and when their numbers enabled them to do as they pleased, the military treated the peasants as Cossacks know how to treat their victims. So far as order was restored, it was due not to the submission of the peasants, but to the increase of the number of the troops to a point which made outward resistance hopeless. The peasants gave up religious worship altogether, and settled down into a state of sullen despair.

The narrative as thus stated takes us down to the latter part of 1874, and it is therefore with some wonder that we find it recorded in April 1875, that all the United Greeks in this part of Poland, to the number of a quarter of a million, had been suddenly and happily converted to the Orthodox Greek Church, and had abjured altogether the Latin worship and the ways and works of Rome. The Russian Government says that this conversion was spontaneous, and was caused by an indiscreet Bull issued by the Pope which did away with the recognition by Rome of the distinctive Greek rites of the United Greeks. This brought home to the people that they must belong to one of the two Churches, and they chose to belong to the Greek Church. They could not bear to be of a different religion from their beloved EMPEROR, and so they all went over to the fold to which he is pleased to belong. In Russia, however, conversion is not an easy matter, even when it is conversion to the dominant religion, and it was some months before these penitent enthusiasts could get permission to be converted to the creed of the Czar. It was only when the Czar had himself gained an adequate assurance of their sincerity that the permission was accorded, and then, by way of a beginning, fifty thousand were allowed the privilege of being converted in a day. An imposing ceremonial, at which delegates from the converted villages attended, gave a fitting solemnity to the occasion. Banners were blessed by an Orthodox Archbishop, and given to the delegates to take home with them, and so beautiful a sermon was preached by a priest who himself was a recent convert that tears trickled down the rugged cheeks of his hearers. In three months two hundred thousand more United Greeks had followed the example thus set, and the religious difficulty was at an end. This is the official account. The account given by adverse critics is widely different. Their view is that this wholesale conversion was entirely due to force. Pressure, to use the vague term employed on such occasions, was exercised until pressure had its effect. Not that the pressure was always very great. No critic could be more hostile to the Russian Government than Colonel MANSFIELD, the English Consul-General at Warsaw, whose communications to the Foreign Office form a large part of the papers now published; and Colonel MANSFIELD was throughout of opinion that the mass of United Greeks were not much interested by the Latin rite, and he ascribes their facile conversion, not only to this indifference, but also to the political action of the Slavonic propaganda, which inclined them to be of the same religion as the head of the Slavonic community. But, in the district where the people clung passionately to the rite to which they had grown accustomed, the conversion was, according to Colonel MANSFIELD, far from being gentle, voluntary, or real. He says that the peasants bitterly complained of the conduct of the delegates, who had no authority to represent them, and he

relates a story of a village where the peasants were driven by soldiery through a half-frozen river up to their waists in water to the parish church, where they were made to sign a petition praying for permission to be converted. Even after the conversion was nominally completed, painful differences arose between the peasants and their priests. The peasants insisted on having miracles. The VIRGIN appeared and a crucifix bled; and a priest was much maltreated for venturing to explain that the bleeding was an exudation of resin.

When any attempt is made to pass judgment on transactions of this kind the first thing is to get at the facts; and here the usual experience of atrocity stories repeats itself, and examination shows that it is hard to come at the true story. Colonel MANSFIELD was at Warsaw, where he heard anecdotes related to him by Poles, and these anecdotes of Catholic Poles were his authority for his statements. Lord AUGUSTUS LORTUS treated the communications of Colonel MANSFIELD with coolness, and when he sought corroboration for them he ascertained that no statements of cruelty having been committed had been transmitted from the Austrian Consul-General at Warsaw to the Austrian Embassy at St. Petersburg. This does not at all show that the stories told by the Poles were not true, but it shows that stories about Russian atrocities, like stories about Turkish atrocities, must be taken with a prudent reserve. Then it must be observed that all the alleged cruelties, or almost all, were committed by soldiers who had been attacked in carrying out their military duty. It was the peasants who attacked the soldiers, and not the soldiers who attacked the peasants. The priest recognized by law was being placed in possession of his church by the authorities, and the congregations resisted by violence the action of the authorities. It is the barbarous use of the lash that shocks Western readers; but it is a barbarism in complete harmony with the savage customs of Russia. If the story of the peasants being driven through freezing water to sign the petition is true, this was an indisputable instance of religious persecution; but most of the anecdotes are tales of the vengeance of soldiers placed in danger of their lives while carrying out the commands of their superiors. That the authorities should interfere to impose a priest on a congregation which does not like him is only an act of persecution when the law allows a congregation to choose what doctrines and rites its priest shall follow. The law recognized, and had for centuries recognized, the United Greeks as having a peculiar religious position, and it was the congregations and not the priests or the authorities who claimed to have this position altered. Nor, again, is it very reasonable to doubt that the Papal Bull of 1874, coupled with the preaching of grand Slavonic ideas, contributed largely to the sudden conversion of the mass of the United Greeks. The many discomfords attending their position as United Greeks, left out, as it were, in the cold between the two religions, had probably much to do with the change; but other motives had also so much to do with it that to call this conversion a forcible one would be unfair both to the converters and the converted. If the whole matter is looked at fairly, it is not so much any exceptional atrocities of the Russian Government that we discover in this instance. It is rather the ordinary character of the Russian Government apparent throughout, its ruthlessness carrying out of its pleasure, the barbarism of its instruments, the iron tyranny which treats all conversion and all incitements to conversion as crimes unless the State is pleased to approve of the change, the apprehension hanging over every one of exile to Siberia, or banishment or deportation to an unknown settlement where life may be endurable, but old friends are lost, and strangers are set as spies over the newcomer—it is all these things that make us recoil from Russia and the Russian Government, and lament that any fresh portion of the human race should come under the dominion of the Czar.

FRANCE AND RELIGION.

THE condition of Europe at this moment offers a singular contrast to the predictions which used to be common some five-and-twenty years since. It was then popularly supposed that the age of theological enthusiasm had finally passed away. The world had not then come to the conclusion that it could do without a religion altogether, but

it was for the most part content with a creed which it called Christianity, and which was made up in about equal parts of the pleasanter side of Christian morality and the more obvious results of Free-trade. International Exhibitions were supposed to have taken the place of religious functions, and the ennobling aspiration that the produce of all parts of the world might be admitted everywhere free of duty was accepted as an excellent substitute for the old-fashioned doctrine that "the earth is the Lord's and the fulness thereof." The Papacy in particular was regarded as a played-out institution. The Catholic nations were slowly but steadily growing more enlightened, and as no Protestant would ever again dream of anything so antiquated as persecution, this progress might be trusted to go on without let or hindrance. It was even hoped that in time the POPE would himself see what an anachronism he was in Europe, and after a slight show of resistance consent to some convenient arrangement by which he would retain a certain titular dignity, and enjoy the sort of deference from his spiritual children that a kindly old annuitant may expect to obtain from a family to which he has nothing to leave. In short, a religious peace had been arrived at by the reciprocal indifference of Protestants and Catholics. The one was supposed to see nothing that it was essential to attack; the other nothing that they much cared to defend. The spectacle presented to-day has absolutely nothing in common with the spectacle which might have been looked for after a quarter of a century of this gradual advance towards a commercial millennium. With the solitary exception that France is trying to pretend to feel interested in a possible Exhibition next year, all the conditions have changed. Theological enthusiasm never ran higher. Since the age of the Reformation there has never been anything corresponding to the existing aspect of intellectual Europe. The disintegration of religious belief has undoubtedly gone on much more rapidly and thoroughly than was expected. But, instead of having the effect of bringing men together in a kind of languid acceptance of the substitute most popular at the moment, it has arrayed them in two camps, each of which is daily going forth to the fight and shouting for the battle. The Papacy, though its temporal dominion has disappeared, holds a religious sway more potent than it has exercised for centuries. In Prussia the whole apparatus of persecution has been revived against the Catholics, while Italy seems bent on improving upon Prussian example, and making it impossible for Catholics and non-Catholics to live together except as armed and watchful foes. In France, the most theologically careless of Continental countries, a Catholic reaction is going on before which political passion grows pale. Nothing is talked of, nothing is thought of, but religion, and, no matter in what a controversy begins, it is sure to end in theology. Even the destruction of the POPE's temporal power, which at one time seemed as complete as that of the Holy Roman Empire, is no longer acquiesced in. Catholic hopes of its restoration are no longer set down by the wiser heads of the Church as mere pious fancies; they are accepted as counters having a certain positive value in the game. Without expecting it or knowing it, we have drifted into a region of theological tempest from which no one can see any issue.

It is in France especially that the religious question swallows up all others. It might have been thought that, in a country which is only separated by an interval of three years from a constitutional controversy of the first magnitude, religious disputes would have held a subordinate, if an important, place. The best evidence of the falsity of this anticipation is to be found in the fact that the revision of the Constitution which will be possible in 1880 seems hardly thought of except as it affects the religious future of the country. It may be safely assumed that French politicians have not suddenly and universally become keenly interested in religion; but, what is quite as much to the purpose, they feel themselves driven to feign an interest which they do not feel. This may be an important distinction as regards their souls' health, but it has next to no importance as regards the course of affairs. The passion must exist, or they would not feel it incumbent on them to profess to be possessed by it. Even within the last twelve months there has been a change in this respect. Conservatism has found that even in France it cannot command the enthusiasm which it needs for its work unless it can invoke some more ardent sentiment than the wish to keep what you have and to add what you can to it. It is not

long since both Legitimists and Bonapartists seemed to be using the Church for their own purposes. To-day it would be nearer the truth to say that it is the Church that is using the Legitimists and Bonapartists for her own purposes. Even the adherents of the Count of CHAMBORD have to put forward the religious blessings of a restoration as those which most make it a thing to be desired; and though the Second Empire is a little too fresh in men's recollections to allow the Bonapartists to claim quite the same eminence in piety, yet they are anxious to make it appear that in this respect NAPOLEON IV. would not come far behind HENRY V. The son of a man who in his day had more to do with secret societies than he afterwards cared to remember has found it necessary to give a formal denial to the statement that he had become a Freemason, and a stronger proof could hardly be afforded of the hold which ecclesiastical ideas have over the most secular of French politicians.

M. GAMBETTA's position illustrates the same tendency from the opposite side. It is probable that, if M. GAMBETTA had been able to choose his part freely, he would have wished to conciliate the clergy rather than alienate them. He has shown this disposition as regards the two other classes which the French democracy most hates—the *bourgeoisie* and the peasantry—and there is every reason why he should equally have shown it as regards the clergy. No man knows better than he that, if the Republic is to be firmly set up in France, it must rest on the basis of a large common agreement. To get it accepted by various sections of the population as the system of government under which they will have the freest scope for their several energies is the object which he has all along proposed to himself, and if among these sections the clergy could have been included, the success of the Republic would have been assured. But M. GAMBETTA has seen that this consummation is made impossible by the division existing between the Church and the democratic party. To what extent this division is radical and permanent is a question which does not concern the immediate political issue. The Church as it is and the democracy as it is cherish a mutual hatred of the intensest kind. The gulf between them is one which even M. GAMBETTA's skill in compromise could not hope to bridge over. If he had crossed it himself, he must have crossed it without a follower; and a Radical leader without a Radical party would have been a convert of no consideration. Neither side will accept anything but complete submission. The democracy wishes to see the Church destroyed; the Church wishes to see the democracy subjected to the stern but salutary discipline of an absolute Government. In these circumstances a Republican leader is almost forced to choose his side, and he soon finds that, if he is to choose at all, there is but one choice open to him.

The latest ecclesiastical excitement in France is the letter of the Bishop of NEVERS to Marshal MACMAHON, and the rebuke which the Cabinet has been compelled to administer to the BISHOP. The faithful of the diocese of Nevers cannot complain that they have not a sufficiently vigorous shepherd. No mediæval Pope ever told a King his duty with more plainness than Mgr. DE LADOUE has used towards the President of the French Republic. As the Bishop of a Catholic people, he feels bound to tell the MARSHAL that the position of affairs in Italy has become intolerable; that the spiritual liberty of the POPE is of more importance to a Catholic nation than the renewal of the Treaty of Commerce with England; and that though it may not be in the MARSHAL's power to do anything for the POPE at this moment, he ought at least to leave Europe in no doubt as to the feeling of the French Government towards the rival powers which claim Rome as their capital. Let the MARSHAL declare plainly that the France of ST. LOUIS and CHARLEMAGNE has nothing in common with the Italian Revolution. He will thus make France the natural rallying-point of Catholics all over the world, and at all events escape responsibility for the crimes of which Italy is the theatre. Marshal MACMAHON has probably a soldier's dislike to see the clergy invading a province not their own; but the censure which he has ventured to administer will not disprove of the spirit which has called it forth.

THE RAILWAY COMMISSION.

THE Railway Commissioners have lately, in compliance with the Act by which they were constituted, published their third annual Report. As on former occasions,

they hint at the expediency of increasing powers which have in some instances been so exercised as to cause considerable alarm. There is no doubt that the Commissioners have discharged their duties with zeal and integrity; but it was observed that during a considerable time the two lay members who were left alone by the illness and death of Mr. MACNAMARA decided important questions as confidently as if they had been Judges of the highest authority. No tribunal deals with property of greater magnitude; and some of the precedents which are established may affect the value of all the railways in the kingdom. It is always inexpedient to question without urgent necessity the soundness of the decisions of any judicial body; but it is generally thought that the Railway Commissioners have too habitually refused to allow of appeals to a superior Court. In the majority of cases recorded in the Report only questions of fact were in dispute; and in other instances the Commissioners under the Act discharged the functions of arbitrators. It must be presumed that they arrived at sound conclusions; but it may be remarked that neither the judgments which are published nor the general Report furnish sufficient materials for forming an opinion on the merits of the different cases. The evidence and the arguments on either side are necessarily omitted; and it is only possible to discover that the judgments are carefully drawn, and that they may probably be sound. If each Division of the Supreme Court were compelled to publish a similar Report, the result would not be edifying, although judgments on points of law are more useful than accounts of issues of fact. The Report of the Railway Commission is analogous to a report of cases decided at Nisi Prius. A prefatory summary of decided cases has an apologetic air which scarcely becomes the dignity of a judicial body. In several instances the Railway Commissioners give an account of disputes in which they have ultimately had no need to exercise a discretion. It seems scarcely worth while to print at the public expense a statement that two Companies made an arrangement for the division of the proceeds of certain traffic in agreed proportions.

In cases where a formal judgment has been given, the issue is sometimes absurdly small and totally isolated. A certain Company refused to allow another Company to use its running powers by placing on the railway an engine which was said to be dangerously wide. "We decided that," except where less than a space of six feet had been "allowed between the sidings in the station-yard, the engine was not unfit to be used." It may be collected from the special proposition that, if an engine were too wide, the running Company could not compel the owning Company to admit it on their line. In their capacity of arbitrators, the Commissioners have promoted the public interest by construing with legal strictness ambiguous agreements by which Companies have pledged themselves to restrict the railway accommodation of a district. These agreements have generally acquired Parliamentary validity by being scheduled to Acts; but they fortunately admit of being explained away; and the Commissioners are more ready than ordinary arbitrators to limit the operation of treaties made for purposes of obstruction. A student of the Report must be actuated by morbid curiosity if, except for some practical object, he seeks to comprehend a narrative of the judgment which regulates the times of arrival and departure of the Caledonian trains. The question may probably have been of some importance to the Scotch Companies, and even to the passengers by their lines. The North British Company possessed statutory powers to compel the Caledonian Company to run trains in conjunction with their own. An improvement in the corresponding service of the English Companies affected the time of the Scotch trains; but the Caledonian Company seems to have objected to alter its time-table. The Commissioners gravely state that they have given the relief demanded in respect of three trains; but that they have left the fourth train without alteration. In the same manner a County Court Judge might, if he were compelled to publish his decisions, inform the Crown and the community in general that he had ordered a defendant to pay one part of his debt in a single sum; that he had allowed him time to discharge another part of the claim; and that a third charge had been wholly disallowed. As the law in England is principally extracted from judicial decisions, it is necessary that the determination of legal questions should be known to lawyers; but the provision of Reports is left wholly to private enterprise, while the opinion of a

half-day tribunal that a special agreement is to receive a certain construction is solemnly recorded in a Blue-book.

Several cases are reported in which the Commissioners have decided, for or against Railway Companies, alleged cases of undue preference. Private traders may deal, if they find it their interest, on different terms with their various customers; but, by Mr. CARDWELL'S Act of 1853, Parliament properly restrained Railway Companies from preferring one freighter or carrier to another. The Court of Common Pleas afterwards, by an obviously just interpretation of the Act, allowed Companies in certain cases to grant lower terms to large customers in consideration of greater cheapness or of higher profit. Whether the requisite conditions of differential rates are satisfied is a question proper to be decided in each separate case. The Commissioners have probably, in determining such disputes, given due weight to the facts and arguments on both sides; but they could not alter the principle of the Act as it had been construed by the Court of Common Pleas. If the tribunal is reconstituted when the term appointed by the statute expires, Parliament will do well to omit in a new Act the obligation to report a trivial dispute between a carrier and a Railway Company. It is barely possible that the Reports may furnish arguments to counsel engaged in similar inquiries before the Commissioners; but, even as precedents, former judgments will, from difference of circumstances, be in most cases irrelevant or misleading. The Commissioners themselves are perhaps not unwilling to call attention to decisions which may be thought to prove the utility of a special tribunal. If similar provision were made for the litigation which arises in other branches of business, the Law Courts, which have already occupied many years in construction, would require indefinite extension. There is not the smallest reason why cases of undue preference in contravention of the Act of 1853 should not be heard and decided by the regular Courts. The Commissioners boast at the beginning of their Report that the number of applications has been greater in three years than it had been in the interval between 1853 and the establishment of the Commission. It is true that the existence of a remedy for undue preference is now more generally understood than in former years, and it is possible, though it is not certain, that the proceedings before the Commission may be speedier and cheaper than before the Common Pleas; but against any saving to suitors must be set the charge on the public funds of several thousands a year for a Commission which is not yet provided with full employment.

Some cases which are not included in the present Report have raised grave doubts as to the powers of the Commissioners. In a well-known instance one of two competing Companies, wishing to obtain access to a line and station of the rival Company, and not having sufficient ground to appear in assertion of its claim, was allowed by the Commissioners to use local bodies as its instruments for obtaining a considerable pecuniary advantage to itself. By an ingenious fiction the real applicant appeared as a co-defendant in the suit, and displayed apparent public spirit by ostentatious readiness to comply with the judgment of the Commissioners in his favour. The promoters of the litigation had been defeated in an attempt to obtain the same benefit in an inquiry before a Parliamentary Committee; but the Commissioners assumed a right to provide for the public convenience without regard to the respective rights of the Companies who were the substantial principals in the dispute. In other cases the Commissioners have inclined to favour applications for the improvement of railway stations at the expense of the Companies, and they have not even inquired whether the Companies possessed capital applicable to the purpose. It would be hasty and unreasonable to assume that any tribunal has misunderstood or exaggerated its powers; but, if the Commissioners have rightly interpreted their own jurisdiction, it would seem that Parliament must inadvertently have conferred anomalous powers on a body which can never have been intended to possess an almost unlimited right of interference with property. Two years hence the Commission will expire unless its powers are renewed; and it will then be possible, if the ordinary Courts cannot be trusted with railway litigation, to limit, to define, or to extend the attributes of the Commission.

HOW TO WASTE PUBLIC TIME.

IF Mr. BIGGAR were capable of taking a lesson, he might have profited by a little incident which occurred on Monday evening. Had any other member given a solitary vote in support of an amendment not of his own introducing, and then challenged the SPEAKER'S decision, it is probable that the mover would have been touched by this devoted exhibition of discipleship, and would have given the supporting Aye which it seems is a necessary qualification for tellership. But the prospect of marching into the lobby in close companionship with the great chief of the obstructives was too much for Sir A. GORDON'S self-possession. He sat mute when Mr. BIGGAR a second time declared that the Ayes had it, and suffered his amendment to fall to the ground in preference to prolonging its existence by Mr. BIGGAR'S aid. If more members would follow Sir A. GORDON'S example, we should not despair of seeing the strategy of the obstructives work its own defeat. There must be many members who have long been dimly conscious of wasting the time of the House of Commons, but have never been really convinced of their sin until they saw it reproduced in colossal proportions in Mr. BIGGAR and Mr. PARNELL. If these gentlemen would only give full play to their penitient emotion, the gain might more than compensate for the weary hours which must be laid at the door of those two members. As yet, unfortunately, Sir A. GORDON seems to stand alone in his determination to have no fellowship with the unfruitful works of Mr. BIGGAR. On this same evening the progress of the Mutiny Bill through Committee was several times delayed by amendments which, if they were not moved with the same purpose as Mr. BIGGAR'S or Mr. PARNELL'S, had very much the same effect. As soon as it became plain that the Irish obstructives had fixed upon the Mutiny Bill as the one which would most easily lend itself to their tactics, the proper course for all other members would have been to accept it *en bloc*. Any really important amendment might have been communicated privately to the SECRETARY OF STATE, and the forbearance shown in not moving it would of itself have given it some claim on his official consideration. Mr. PRIER TAYLOR may be acquitted of any desire to stand well with the Home Rulers; but he has not yet shown himself capable of imposing silence on himself in order not unintentionally to play into their hands.

It will be a very great advantage if the terrible example set by Mr. BIGGAR and Mr. PARNELL should lead other members seriously to consider their ways. A correspondent of the *Times* has bidden us take comfort on the score that the House has been relieved of at least half the private business it had formerly to get through, that opposed private business has decreased in more than its natural proportion; that there are no longer any Election Committees; and that it is now very rare for a debate to be continued more than two nights. These grounds of consolation do not seem to be very substantial. The diminution of private business is a saving of time to individual members rather than to the House of Commons. Committees sit in the morning, and, though the hours between twelve and four may be more agreeably passed now than they were ten years ago, it does not make much difference to the public that the members come into the House rather fresher for work. The shortening of debates is the result mainly of accidental causes. If questions of equal importance with those formerly submitted to Parliament should again come up, or if the Opposition should improve in organization and backbone, there would once more be long debates on the second reading of Bills. Besides which the gain, if gain it be, is pretty well neutralized by the immensely longer time which it takes to pass a Bill through Committee. The notice paper gets constantly fuller of notices of amendments, and questions which are supposed to be settled by the rejection of one amendment are raised again and again upon others which are little more than a reproduction of the first, with such colourable differences as are required to evade the eye of the Chairman of Committees. The abuse of questions is less mischievous in its results than the abuse of amendments, because, as no discussion is allowed on questions, the longest list must be got through pretty early in the afternoon. But it is even more an indication of haste to waste time, or rather perhaps of gross indifference as to how much time is

wasted. It is conceivable that a member should persuade himself that the alterations which he wishes to see effected in a Bill are so important that all other business should give way to them. It is charitable to suppose that, if he had not thought them of some consequence, he would not have proposed them, and a man easily exaggerates the significance of changes which he has himself suggested. But no one can be under any delusion as to the trumpery nature of more than half the questions asked in the House of Commons. Some of them relate to matters with which, on any reasonable theory of Parliamentary jurisdiction, the House of Commons has nothing to do. Others are questions which contain their own answer, or have already been answered by events. Others are asked with no other motive than that of making a Minister say Yes or No when it is believed that he has some reason for preferring to say neither. Perhaps the silliest and most needless question ever put was asked last Monday. An old woman had died in great destitution, and it appeared at the inquest that she had been in receipt of an annuity of 5*l.* from some City Company. The funds from which this annuity was provided had been intended for the assistance of persons who were just able to keep themselves off the parish, and it was consequently one of the conditions that they should not be given to paupers. If there had been any machinery for investigating the circumstances of the annuitants, this old woman would no doubt have been told that, as she had no means of subsistence other than the annuity, she was not one of the persons for whom it was designed, and consequently that she had better go into the workhouse. In the absence of such machinery, it was naturally assumed that, as she continued to draw the annuity, she was able to make a living without applying to the Guardians. Unfortunately her independence was greater than her dread of suffering, and, rather than become a pauper, she was willing to starve. The parochial or charitable organization of the district may have been at fault in not ascertaining the state she was in, but it is clear that the persons who gave the annuity were in no way to blame. As a matter of principle, such gifts ought not to be given to persons in receipt of parish relief, and the decision whether a particular case is one for private charity or the Poor-law is not one for the consideration of a City Company. Yet all these facts—facts which on the face of them showed that the matter was not one with which the House of Commons could have any concern—were duly set out in the shape of a question to the HOME SECRETARY.

The motive in all these cases is substantially the same. It is the fussy desire of notoriety which men feel who have neither the ability to make themselves really conspicuous figures in Parliament nor the common sense which would show them that, without this ability, they had better remain contentedly obscure. The changes which the composition of the House of Commons has undergone of late years have naturally tended to bring men of this class into greater prominence. Everybody knows that no man is so fond of having a finger in other people's business as the man who has retired from business on his own account. The habit of being occupied survives, though the occupation itself is gone. The House of Commons now contains a large proportion of members of this type. They have made their fortunes, and gone into Parliament, and the consequence is that Parliament is the place in which their capacity of boring others in preference to being bored themselves finds its natural and ample field. Something must of course be put down to their desire to stand well with their constituents. The fact that a member's name is associated with a list of amendments that fills a page of the notice paper may be turned to some account in the borough which he represents. The electors do not know that these amendments are pure motions of straw, that there is not the least intention on anybody's part of pressing them, and that their destined fate is to be snubbed by the Minister who has charge of the Bill, and then modestly withdrawn. So long as they are still in the future, they look as imposing as though the acceptance or rejection of them were vital to the fortunes of the Bill, and by the time that they have been dismissed to limbo their author will have another set ready, which, will have the same local notoriety and the same Parliamentary insignificance. Now that the time of the House of Commons has become too short for all it has to do, interruptions of this kind are no longer innocent. Twaddle may employ as many hours as treason, and when the

Session is not at all too long for the necessary business of Parliament if that business is to be properly done, a member who appropriates any part of it to his own private and particular use does as much injury to the public as is compatible with his natural endowments. Unfortunately the diagnosis of the complaint carries us but a very little way towards the discovery of a cure.

FACTORY AND WORKSHOP LEGISLATION.

A BILL which aims at amending and consolidating the whole law relating to factories and workshops may seem, in the present state of public business, to stand but a poor chance of becoming law this Session. A hundred clauses, in almost every one of which lurks something that is inconvenient to employers, afford a tremendous field for that guerilla opposition which every year becomes more formidable. The only chance that such a measure has lies in the known determination of the Government to pass it, and if Mr. Cross can bring his colleagues to give this importance to the Factories and Workshops Bill, it will be well that they should let their resolution be known from the first. It might help to smooth matters if before next Thursday a statement was prepared showing what are the parts of the Bill that introduce any change into the law. A consolidation Bill which is treated as entirely a new measure runs a tremendous risk of being talked out. The present Bill repeals and re-enacts some twenty statutes; and unless some effort is made to restrict the debate on its provisions to those which are really new, there is no reason why the progress in Committee should not be as slow as though all the twenty Acts were under discussion. It will be a very great gain to have the Bill passed, even though it should only consolidate the existing laws. At present there are Factory Acts, Workshop Acts, Factory Extension Acts, and Workshop Regulation Acts; and the restrictions upon employment imposed by one of these Acts are hardly even an index to the restrictions upon employment imposed by the others. In some instances the distinction corresponds with a real distinction in the character of the labour, but in others it is purely arbitrary. This state of things increases the work of the Inspectors, leaves great room for evasion, and even for genuine ignorance of the law, and irritates those employers who think that they are more hardly dealt with than their neighbours. The Reports of the Factory Inspectors are full of examples of all these inconveniences arising from the present confused state of the law, and if Mr. Cross succeeds this year in putting an end to it, he will have made a considerable addition to his legislative successes.

Anything like detailed criticism on a Bill of this nature must be reserved for a later stage of its progress. All that can now be attempted is to give a general view of what it proposes to make law. The Bill begins by providing that all factories and workshops shall be kept clean, free from offensive effluvia, not overcrowded to a degree injurious to health, and so ventilated as to render harmless the gases and other impurities generated in the course of the manufacture. In the next place, certain specified machinery is to be securely fenced, and the Inspector may call on the occupier of any factory to fence any machinery not so specified if it shall appear to be dangerous. In this case an appeal will lie to arbitrators appointed by each side. The same process may be resorted to in the case of grindstones which are either faulty or insecurely fixed. The remainder of the first part of the Bill relates to the employment of women and children. Women are not to be employed in any textile factory, except during a period of twelve consecutive hours, beginning either at six or seven in the morning and ending either at six or seven in the evening. Out of these hours not less than two, shall be devoted to meals, and no woman or young person shall be employed continuously for more than four hours and a half. The regulations about the employment of children are more complicated. In factories no child—that is, no person under fourteen—can be employed except on alternate days, or on the morning or afternoon of successive days. The rules for non-textile factories and for workshops are substantially the same as for textile factories except that in some particulars a little more work is allowed to be done in them. Women employed in workshops which employ children are to be treated as though they were "young persons"; but where no children or young persons are employed, women may be employed for a period of not more than twelve

hours, inclusive of meals, between 6 A.M. and 9 P.M. The hours assigned for meals must be the same for all children, young persons, and women employed in the factory or workshop. Children who are employed in the morning must go to school in the afternoon, children who are employed in the afternoon must go to school in the morning, and children who work every other day must attend school in the morning and afternoon of the alternate day. If a child has not made the proper number of attendances in any week, he will not be allowed to go to work until he has made up the deficient attendances. The principal teacher of the school at which a child attends may apply to the employer to deduct the schooling of the child from his wages, and the employer must thereupon pay over the deducted pence to the teacher. In the case of persons under sixteen there is a further provision that they shall not be employed in factories or in certain classes of workshops without a medical certificate that they are physically fit for it. In the case of those who hold these certificates, the Inspector may insist upon a fresh examination being made of any person under sixteen whom he thinks to be unfit for work.

Certain classes of factories and workshops are subjected to exceptional exemptions, and also to exceptional disabilities. In places where grinding, glazing, and polishing on a wheel is carried on, the Inspector may order the use of a fan to prevent the inhalation of dust; and where flax or hemp is spun in a wet state the workers must be protected from water and steam. Children and young persons are not to be employed in certain specified processes which are specially injurious to health. In certain other unhealthy employments no child or woman is allowed to remain during meals in those parts of the factory or workshop in which particular processes are carried on; and the SECRETARY of STATE may extend this prohibition to other classes of workshops if it shall appear to him necessary, or may rescind it if he shall be of opinion that the need has ceased. The list of exceptions as regards hours of work is a very long one. In certain cases in which the customs or exigencies of the trade either generally or in any particular locality require it, the SECRETARY of STATE may permit work to begin later in the morning and end proportionately later in the evening. In lace factories a boy above sixteen may begin work as early as four in the morning or as late as ten in the evening, provided that his hours of actual work do not exceed nine, that, if he is employed early in the morning, he shall not be employed late at night on the same day, and that if he is employed late at night he shall not be employed early in the morning of the next day. Several trades have certain liberty in the matter of hours specifically granted to them. In cases in which the business depends on the weather or on the season of the year, young persons and women may be employed for fourteen hours on any one day, provided that they are not so employed for more than five days in any one week, or for more than forty-eight days, or, in the case of women, ninety-six days, in the year. Where the process at which children or women are employed is in an incomplete state at the end of the day, they may be employed for half an hour longer on condition that their aggregate work in that week does not exceed the proscribed number of hours. Boys above fourteen may be employed at night provided that they are not employed during the day preceeding or following, and that they are not employed more than six nights in a fortnight. Inspectors appointed under the Act will have power to enter any factory or workshop, taking with them, if need be, a constable or a certifying surgeon, to require the production of all documents kept in pursuance of the law, and to examine any person whom they find employed in a factory or workshop, or whom they have reasonable cause to believe to be employed there, or to have been employed within the two months preceeding. Any person delaying to admit an Inspector, or concealing from him any child or woman, will be deemed guilty of obstruction. The Inspector will have the power of appointing certifying surgeons. The name and address of the Inspector and surgeon, with an abstract of the Act, must be affixed at the entrance of every factory or workshop so as to be easily read by the persons employed.

It will be seen that, though the particular provisions of this Bill may need consideration and revision, it would be difficult to make the scope of it more comprehensive. The whole area of women and children's labour is covered by it; and, as regards the former at all events, it

will probably be contended that there is rather too much interference with their right to make their livelihood at their own pleasure. The Bill has the merit of being as simple and intelligible as the complicated character of its provisions will admit; and, if it is passed, we shall for the first time know what the precise law about factories and workshops is.

MR. CROSS AND THE TICHBORNE DEPUTATION.

IT is much to be regretted that the HOME SECRETARY, though as usual acting with the best intentions, should have made the great mistake of departing from an old and sound precedent in granting what Mr. WHALLEY himself has admitted to be "the unusual privilege of a personal interview" to a set of persons who wish to upset the ordinary course of justice. Mr. WHALLEY also explained that "the deputation desired to have the opportunity of bringing before the right honourable gentleman such further evidence as might be available in support of the appeal on behalf of the convict that he was the person he pretended to be—ROGER TICHBORNE, or, at all events, not ARTHUR ORTON, or, failing to establish either of those propositions, that he had not had the means of conducting his defence in such a manner as justice required." It appears that the HOME SECRETARY was not beforehand aware of the particular points which the deputation wished to bring under his notice; but he can have had no doubt as to that after Mr. WHALLEY'S explanation. Indeed, he himself desired the deputation "plainly to understand that it had not been the practice in this Office for the SECRETARY of STATE ever to receive a deputation in respect to any criminal, and therefore it was quite impossible to allow any discussion on the merits of the case itself." And there he ought clearly to have stopped, or rather he ought to have in the first instance refused to receive the deputation for this obvious and well-established reason. Yet he not only fell into this error, but even allowed Mr. DE MORGAN to justify the unquestionably unlawful tumultuous gathering in close proximity to the Houses of Parliament on the previous evening; and did not stop even Mr. SKIPWORTH, although his previous eccentricities were so well known, until he made a declaration that there was "a very serious agitation in the country upon this question, and that it had gone on increasing, and was likely to increase, and that nothing but an outbreak —." And here, at last, it dawned on Mr. CROSS that this was not language to which a Minister could listen. But, unfortunately, he again put himself back into a false position when, after this outrageous demonstration, he said, "I thought it best for me to say what I had to say to you in this room, and to state to you exactly the views, not only of this Government, but of any other Government, on that point"; and that it was "only right that you should understand that, while I meet you here, in a somewhat unusual way, to speak to you privately, and not from my place in Parliament, if a motion should be made to hear any one from the Bar as asked, I should feel bound to advise the House not to accede to it." It is obvious that nothing can be more inconvenient and dangerous than to permit pressure of this kind to be brought to bear on a Minister in order to get Government to overrule the ordinary administration of justice; and it is to be hoped that a firm stand will in future be made against such illogical and useless concessions as that which Mr. CROSS has granted in this case. At the time of the Hyde Park riots, the Minister who had to discuss the question with the leaders of the mob was moved to tears; and the present HOME SECRETARY'S fatherly and confidential talk with the TICHBORNE deputation seems to be a weakness of the same kind.

THE VICTORIOUS CITY.

ALTHOUGH Cairo is, strictly speaking, in Africa, it is the most intensely and typically Asiatic city in the world. Except, perhaps, at Damascus, there is no other place in which the characteristics of the Mahometan Semitic races can be so easily studied. The people call themselves not Egyptians, but Arabs. They talk Arabic, and are of the religion of the Arabian Prophet; though it would not be easy to say from what original stock they are really derived. Are they, in the main, descendants of the ancient inhabitants of Memphis? The Copts, whose name would make them the representatives of the old Egyptians, are even now easily distinguished from the ordinary "Arabs" by their superior appear-

ance. But they may represent the governing classes, those who compelled the construction of the great monuments, and whose features are found in the statues of the mighty monarchs of thirty and forty centuries ago. The lower ranks are Mahometans, and possibly many of them are Arabs; but they are a down-trodden race, the servants of servants, the toilers, and cannot differ very much from the people of whom Herodotus says, truly or falsely, that a hundred thousand of them at a time were forced by Cheops to build his pyramid. But Maer el Kahira, "the victorious city," is altogether Arab. The Roman fortress, erected to overawe Memphis, and still known as Babylon, is tolerably perfect; much more perfect, indeed, than any remnant of the Roman rule in England; but it lies some miles south of Cairo, and was not even included in the early Arab town, Fostat, now called Old Cairo. As Egypt was one of the first conquests of Mahomet's disciples, one of the earliest seats of the great Caliphs, and long the centre of Arab civilization, it has more features of purely Arab type than Constantinople, or indeed any other Oriental city of its size either in Europe, Asia, or Africa. The traveller, therefore, who desires to see the Mahometan at home cannot do better than seek him in Cairo, and he finds in the narrow, picturesque streets of the old parts of the town scenes of interest which he may seek in vain elsewhere. When he emerges into the modern quarters the change is remarkable. Though all the tyranny of the Turks has not sufficed to alter the indelible characteristics of the place, and though the wide squares, the fountains, the gardens, the arcades, the watered roads, the rows of villas have a half-French look, the people who crowd every thoroughfare are as unlike anything European as they can be. Here, a long string of groaning camels, led by a Bedouin in a white capote, carries loads of green clover or long faggots of sugar-cane. There, half-a-dozen blue-gowned women squat idly in the middle of the roadway. A brown-skinned boy walks about with no clothing on his long, lean limbs, or a lady smothered in voluminous draperies rides by on a donkey, her face covered with a transparent white veil, and her knees nearly as high as her chin. A bullock-cart with small wheels, which creak horribly at every turn, goes past with its cargo of tracle-jurs. Hundreds of donkey boys lie in wait for a fare, myriads of half-clothed children play lazily in the gutters, turbaned Arabs smoke long pipes and converse energetically at the corners, and every now and then a pair of running footmen, in white shirts and wide short trowsers, shouts to clear the way for a carriage in which, behind half-drawn blinds, some fine lady of the Viceregal harem takes the air. She is accompanied perhaps by a little boy in European dress, and by a governess or nurse whose bonnet and French costume contrast strangely with the veiled figure opposite. A still greater contrast is offered by the appearance of the women who stand by as the carriage passes, whose babies are carried astride on the shoulder, or sometimes in the basket so carefully balanced upon the head. The baskets hardly differ from those depicted on the walls of the ancient tombs, and probably the baby, entirely naked and its eyes full of black flies, is much like what its ancestors were in the days of the Pharaohs. In the older quarters of the town the scenes are much the same, only that there is not so much room for observing them; for the streets are seldom wider than Paternoster Row, and the traveller who stops to look about him is roughly jostled by Hindbad the porter, with his heavy bale of carpets, or the uncle of Aladdin, with his basket of copper lamps, or the water-carrier clanking his brazen cups, with an immense skin slung round his stooping shoulders.

Those sanguine people who believe in the possibility of reformation and improvement under Turkish rule should visit Egypt. We are so often told of the enlightened policy of the Khedive that some of us, especially those who only look at Cairo through the windows of a comfortable hotel, are inclined to think that nothing but the incorrigible stupidity of the people prevents their improvement. But a little inquiry soon demonstrates the truth. The civilization of the Viceregal Government is more apparent than real. Where Europeans come, and where European public opinion can be brought to bear, there is a semblance of justice, of economy, of progress. But it is only a semblance. The hideous bulk of the Mosque of Mehemet Ali in the citadel dominates in every view of Cairo, and the Khedive himself seems to fill the foreground in every social or political view of the Egyptians. There is no private enterprise. Why should a man lay by money when it will almost certainly be taken from him? Why should he improve his land when the Pasha may some day seize it? Why should he endeavour to educate his sons when they may be taken like runaway convicts, and sent he knows not where, under the forms of conscription? All round about Cairo there are vast lath and plaster buildings, chiefly standing in wide gardens and surrounded by high walls; you ask what they are, and the answer is always the same—palaces of the Khedive. Three years ago it was reported that his Highness had thirty-three palaces, but he still goes on building. A magnificent but flimsy villa, surrounded by a large park, has just been furnished at Ghizeh, in sight of the Pyramids. Another is in process of completion on the opposite side of the road. There is a long, low house, round three sides of a square, in the heart of the city. There is a long red wall made of boarding painted to imitate brickwork, facing the island of Roda. There is a splendid but tawdry plasterwork palace at Gezireh, on the west bank opposite Boulak. There is a half-built "hôtel" in the French style near Old Cairo. There is a vast series of irregular halls and rooms of state in the citadel. In fact,

everywhere you turn there is some such house building, or built, or abandoned and closed; and every one of them is a "palace of the Khedive." It is the same as you ascend the river, until it becomes one of the standing jokes of the Nile voyage whenever a house, or gardens, or white walls appear, to ask, "Is that a palace of the Khedive?" And in nine cases out of ten the answer is in the affirmative, while in the tenth case it is that the building in question belongs to one of the Khedive's sons, or sons-in-law, or stepmothers, or cast-off concubines. If, as your boat lies at Ghizeh, you look out of your window in the early morning, you will probably see a long and melancholy procession on the bank. First comes an ill-looking man in a red fez and a long white shirt, carrying a cane. Then come two or three dozen boys and girls, half naked, footsore, weeping as they limp along, or trying to sing a kind of slow chorus, and following them another man with a cane, which he freely uses to encourage the loiterers. This is a gang of day labourers. The Khedive is filling up some low-lying land with earth taken from the river's bank, and these poor little wretches have been requisitioned from the villages and suburbs to carry the soil from one side of the road to the other. They are paid a microscopic sum—at least it is paid to the taskmaster—and you hope against hope that they ever get any of it. In the hot midday you pass by the scene of labour and see them at work, and after sunset you hear the sad chant of the morning and see the same processions, without the canes, going home. It is shocking to see young girls carrying huge burdens of earth, or baskets of lime for the builders, or running up and down to the Nile for water for the workers, their feet and often their bare shoulders bleeding. Their lives are "bitter with hard bondage, in mortar and in brick, and in all manner of service in the field," as Moses wrote of the Israelites; only that now it is the Egyptians themselves who suffer at the hands of the Turks. Forced labour is still the rule all through Egypt, as it probably was thirty centuries ago. All the great works have been performed by it. At the sugar factories in Upper Egypt, at the Canal works, at the railways, and, above all, at the palaces of the Khedive, the labourers are driven to their tasks, and are paid as their masters please. In the sugar factories they receive a portion of treacle, valued at the highest market price, for their wages; and, if they like, can sell it back again at the lowest price. Just as we may suppose the great Pyramids on the long line of hills above the ancient Memphis to be symbolical of the tyranny which afflicted the labouring population of the vast city so many centuries ago, so the earthworks, the long walls, the high roadways, and the palaces of the Khedive are signs of the afflictions which English money enables the Turkish rulers to lay upon Cairo and all Egypt.

To say that the Viceregal Government is unpopular with the lower orders would be to speak too favourably of it, as we understand the unpopularity of an English Minister. A recent traveller had occasion to ask a Fellow if he could say to whom one of the suburban mansions belonged. "It is of course," was the reply, "a palace of the Khedive now, but it was built by the man who has gone to open the gates of Gehenna for him." Thus a prosperous man, as the Egyptians count prosperity, spoke of his Sovereign and the late Finance Minister. "But," he was asked again, "Sadyk Pasha was banished, not put to death." "Well, it comes to the same thing," was the answer; "he went to Dongola, and there the coffee did not agree with him." Every traveller who has come into contact with the lower orders in Egypt can tell similar stories if he likes; and it may be asserted broadly that the Turk is quite as much disliked by the Egyptian, be he Copt or Arab, as by the Greeks or the Armenians. He offends their religious prejudices as well as their sense of justice. One of the first objects seen on arrival at Cairo is a statue representing, in bronze of colossal size, Mehemet Ali on horse-back. To make statues is a crime of great magnitude to the Moslem mind. It is characteristic of the bastard civilization grafted upon Egypt by its present rulers, that, though the statue is bronze and a fine work of art, the lofty pedestal is of wood, painted in imitation of stone. A similar and equally typical example of the way in which public works are carried out may be seen in the mosque in the citadel. The walls are lined with slabs of alabaster for about twenty feet from the ground, and above that height are painted and grained in imitation. Immediately below this monstrous monument of Turkish taste is the mosque of Sultan Hassan, an edifice contemporary with our own Salisbury cathedral, and worthy of careful study by every lover of simplicity and beauty in architecture; and here, while countless sums have been laid out on a French Alhambra kind of mosque close by, the whole building is going to destruction from neglect; its exquisite fretwork of precious inlays dropping from the walls, the roof of the central kiosque stripped off in great patches, the beautiful Syrian lamps, so much praised in the guide-books, all gone, and the vane of the graceful minaret bowing to its fall. Yet it may be safely predicted that something of Sultan Hassan's building will remain long after every palace of the Khedive has disappeared. English bondholders may wonder where their money has gone, but a few days in Cairo would soon settle their minds. Let them look at the palaces, as aforesaid; let them walk past two or three of the vast barracks, each filled with black regiments, every man of which has been bought from a slave-dealer in Central Africa and transported at immense cost, in spite of all treaties with the abolitionists. Let them stand aside as two grooms in purple and gold and fine linen clear the way for a mag-

nificent pair of English high-stepping horses, drawing the carriage in which one of the Wiesregal family is seated, while a couple of human trot at the wheels; let them, in short, see Cairo as it is, and not through the false gloss of half-French civilization which its Turkish conquerors have imposed on it.

PLAGUE OF CIRCULARS.

THE proficiency of some ancient peoples in the fine arts is supposed to have been due to their always having had the best models before their eyes. Their taste became insensibly affected by the purest influences, and awake to the slightest deflection from the beautiful. In the same way it is to be supposed that the generations which succeed our own will carry the art of advertising to a perfection at present undreamed of. Even now, whenever we go out of doors, our eyes are habituated to monstrous devices, and assailed by an endless variety of crude colours and gigantic letters, which are the modern substitute for the old plan of blowing a trumpet before one. The splashboards of cabs, the compartments of railway carriages, the tops of omnibuses, every empty corner, and all hoardings, are decorated with mysterious names, or names of world-wide notoriety. Pictures of dogs and rabbits undergoing, with a calmness which speaks of anaesthetics, the complicated tortures of vivisection, alternate with a study of a monk in an ecstasy over the virtues of his convent's liqueurs. The Christian names and pet names of young ladies who condescend to adorn the British stage compete with the titles of some scores of fresh weekly publications. The new picture gallery which is to revive English painting under the sweet influence of daddos does not disdain to announce itself by the same methods as patent starch and sewing machines. The eyes are dazzled by the prodigality of cheap colour, and the mind worried as if by the entreaties of the importunate widows with match-boxes and nine small children who infest side streets. The very flagging on which one walks is branded with the names of plays, or of shopkeepers who clamour for custom; and it is only after a man reaches his own door and enters the sanctity of his home, that he can expect to escape advertisements.

Any such expectation is of course doomed to wretched disappointment. The advertisers of every sort have long been aware of the virtues of the penny post, and have made post-time hideouts. Different people have different views of the sensations produced by receiving letters. Some persons feel, or affect, a horror of correspondence. They give you to understand that all news to them is likely to be bad news, or news in which they are not interested. If they have friends, they do not wish to hear from them and so become their debtors for an epistle which it is a labour to write. Letters not from friends are apt to be reminders of debt. As people grow older, they become more averse to letters, which young people generally welcome with some little excitement. But the advertiser and the importunate person have made letters equally distasteful to young and old, to the cynical and the sympathetic. They have employed the post as a means of thrusting their greedy and importunate existence within the Englishman's castle, and they succeed in spoiling his temper at breakfast first, and then at almost every hour of the day. A man is anxious to hear about some matter of business or of private importance, and in the crowd of envelopes which await him, he expects to find the letter he wants. But all the envelopes cover petitions for custom, or for charity in one shape or another. The senders forth of circulars have become too wary to use the blue and businesslike envelope in which the eye at once detects an advertisement or a dun. They employ clerks who do not write a clerk's hand, but imitate the writing of ladies and gentlemen. They are great in monograms, and rejoice in twisted snakes and combinations of mediæval letters. They are even in danger of overdoing this trick, and people will soon come to regard an ornamental device on an envelope as the mark of the boast, and the note of the advertiser and the begging-letter impostor. Perhaps the greatest impertinence of which these noxious people are guilty is the use of scented paper in their communications—paper which poisons the air, and excites a wild irritation in the mind of the recipient which surely cannot be good for the intrusive tradesman.

It is impossible, of course, to number and describe the various contents of the postal advertisement. Some of the persons who issue circulars inclose in the bedizened envelope a post-card for an answer, their purpose being to give the appearance of a card of invitation to some rich man's banquet. Thus they hope to secure the opening of the envelope, which otherwise might be tossed unnoticed into the waste-paper basket. Not so often now as formerly, the lithographed letter offers to lend money at a rate and on security suggested by charity rather than by commercial speculation. Seedy wine-merchants deal largely in the postal circular, and flashy drapers invite attention to their "sumptuous show-rooms." Lecturers entreat your attendance at the South Kensington College for Ladies, where you may be instructed in the language and literature of England. One peculiarly impudent circular calmly announces that Messrs. So-and-so "desire to call attention to the fact that they do not seek for patronage by means of advertisement in the daily papers," because "advertising is such a heavy item in the working expenses of a business." To intrude, as it were, upon the privacy of people dazzled with advertisements, to tell them, in a friendly way, that you prefer to bore them at home because it is

cheaper, is an instance of almost ideal coolness. The benevolent advertiser is, if possible, more daring than even the enterprising shopkeeper. One lady, for example, sends a circular in which she sets forth the merits of her schools for girls. As she is deeply interested in her schools, she hopes that you will excuse her for trying to make you deeply interested in them. Her schools are not open to public inspection, and she does not pretend to enable her pupils to compete with young ladies who attempt the Cambridge examinations; but many clergymen have expressed their surprise at the knowledge of her pupils. This sort of circular ends with a request for an answer, and a threat that, if you do not reply, you will be attacked with a fire of fresh circulars, till you give in and parley. Parley in such a case, as the French proverb says, means surrender. The clergy are continually evoked, as the patrons of circulars, by the writers of begging letters, and few people make a more unscrupulous use of the post than clergymen in want of subscriptions. Thus a clergyman wishes to restore his church, or to build a new one, or to buy an organ, or what not. If he confined his importunities within the circle of his parish, no one need find fault with him. But his church is in the North-West of England, and the happy thought occurs to him that there is such a thing as a North-Western Railway. Immediately he sends a circular to all holders of the stock of this line whose existence he can ascertain, entreating them to help him to buy his organ, or build his spire, which they cannot but wish to see done at once. The railway, that great bond of union, connects all holders of its shares with his parish of Stickton-le-Mud, and makes the wants of the parson of Stickton important to a wide circle of people who never heard of him before.

University men may remember that when they succeeded in taking a pass degree, or in gaining the Ireland Scholarship, or in any other way became conspicuous above their fellows, their staircase was at once crowded by shabby people who took a lively interest in their welfare. Dinky creatures who had never heard of them before now avowed that they had rung bells to their glory and were eager to drink their honour's noble health. This was a standing tax on momentary notoriety, and in these days of circulars few people escape a similar tax. Is there a death in a family? At once a troop of ghouls pour in their black-edged circulars, full of condolence and advertisements of mourning warehouses. Naturally some one must open the letters in a time of trouble and confusion, and it is difficult to express the disgust with which the texts, and verses, and references to reformed funeral arrangements are read. Every pushing shopkeeper thrusts his greasy condolence, and the notice of his pious readiness to spare expense, or to honour the dead in a more sumptuous way, on the grief of widows and orphans. Another torment is still more ridiculous than this, but equally testifies to the extreme selfishness, bad taste, and greed of the people who descend to it. As soon as a birth is announced in the column of newspapers dear to ladies, the home of the infant is deluged and his parents distracted with circulars, most of which contain small packets of socks for the sweet baby. The people who send the socks are sometimes "young ladies in distressed circumstances," sometimes afflicted but honest "members of poor families," sometimes "mothers who have seen better days," very often clergymen's wives who are anxious to restore their husbands' churches. The impudence of vulgar piety can hardly go further. Of course the people who send cheap ready-made socks for the baby wish to have them returned if they are not purchased, and of course they enclose quite friendly notes expressive of sympathy and full of congratulations. For the small sum of one shilling and sixpence all this friendly interest can be secured as a permanent possession. The trick is like the advertising wine-merchant's plan of sending about dozens of champagne in the guise of Christmas presents. Perhaps the clergywomen should be punished by having their wares detained, while other stocking-makers may have their produce returned with the postage unpaid. The torment of circulars has grown to such a height that a name cannot appear in print but the owner of the name is made the butt of advertisements and begging letters. A man publishes a book, and the begging letter-writer is down on him with requests for a present of a copy. A young author may be flattered, but a more experienced hand knows that his "History of the Berbers" will be promptly converted into an equivalent in gin, which by no means represents the money value of the volumes. The notoriety which any chance may give attracts the advertiser, who, because you have escaped from a railway accident, sends you a note to recommend his "invalid chair," or, if you have had a fall in the hunting-field, presses on you a stirrup with a name which bears a distant resemblance to Greek. If betrothals were publicly announced in this country, as in Germany, which is happily not the custom, all the furniture men would beset the happy pair with their "hiring system," their machine-made old Saxon chairs and tables, their pianos, and the rest of their abominations. But no one can put into practice the Epicurean's motto so carefully, and choose so well the *fulgentis semita vite*, that the advertiser will not hear of him and make him a victim. The odd thing is that this persecution must pay, or it would not be so prevalent. Some persons must be so constituted, impossible as it may seem, as to purchase the articles recommended in impudent letters which reek of muck. This is a very unhappy thought, revealing as it does unfathomable depths of human stupidity. Circulars may most wisely be regarded as trials of patience permitted for some wise purpose to tempt and assail an irritable generation. A man who can endure

them without loss of temper will not be irritated by Highland midges on a salmon river—perhaps the most maddening of all heaven's creatures—nor by the arrangements of the Metropolitan Railway, nor by the music and the monkeys of Italian organ-grinders.

THE NEXT CONCLAVE.

IT would be, in ecclesiastical phraseology, exceedingly "rash and temerarious" to hazard any confident prediction as to the precise date of the next Papal Conclave. Beyond the facts, on the one hand, that Pius IX. has attained to a very great age, and on the other hand that he belongs to an exceptionally long-lived family, and still retains at eighty-five a very exceptional command of both his mental and bodily faculties, there are no very trustworthy data to go upon. It is true that scarcely a day passes without some fresh report of his failing health, to be followed the next day by a fresh contradiction. But there are so many people with whom it appears to be a matter of policy always to represent the Pope as moribund, if not actually dying, and so many more with whom it is almost a matter of faith to represent His Holiness as in a state of robust health—as though bodily "indefectibility" were included in the Vatican decree—that the reports of either kind have to be so largely discounted as to become practically worthless. In view however of the Pope's great age, and the signs of gradually increasing weakness about which there does not seem to be much dispute, it is natural that the question of what is to happen after his death should be regarded as not "beyond the range of practical politics." Hence the endless surmises, and the vast amount of information—by no means uniformly correct—volunteered from various quarters as to the arrangements of Papal elections in general, and the probable conduct and issue of the approaching Conclave. We reviewed not long since a gossipy book of Mr. Adolphus Trollope's, based so far as the facts are concerned on Mr. Cartwright's classical work on the subject, but with a considerable admixture of fiction and an inordinate amount of padding superadded by himself. Mr. Taylor Innes has taken up the question in a more serious spirit, as might be expected, in the *Contemporary Review*, and has studied Mr. Cartwright's book to better purpose than Mr. Trollope, and without Mr. Trollope's perverse passion for obtruding inaccurate corrections of his own. But, if he is sounder and less inventive in his history, Mr. Innes is much bolder in his theorizing as to the future, and all the concluding portion of his essay reads very much as if the wish had been allowed to become the father of his thought. A reform of the Roman Catholic Church may be a very laudable aspiration or a legitimate aim of action, but even Father Hyacinthe's hair would stand on end at the very simple and drastic scheme proposed by this writer for its accomplishment. We have no disposition to quarrel with his opening statement that the Conclave on the death of the present Pope will be one of the most important in history, nor have we any objection to his inquiring, if he pleases, "what are the greater questions which must then emerge?" But we cannot agree with him that one of these "greater questions" will be the competition—and, as he evidently anticipates, the successful competition—of an anti-Pope.

After some stray remarks on the ceremonial of Conclaves which will tell Mr. Cartwright's readers nothing new, the writer quotes the three articles of the Italian Guarantee Laws bearing on a Papal interregnum which distinctly secure the personal and official freedom of the Cardinals; and although there is no special provision authorizing them, as the Pope himself is authorized, to retain guards of their own, we cannot see what practical difference that would make as long as the Government honestly intended to keep faith with the Curia. From these minor points Mr. Innes passes to what he rather oddly calls "the power of an existing Pope over the Assembly which is to elect his successor." This of course can only mean the power of a Pope during life over the Sacred College in filling up vacancies, restricting or annulling the rights of its members, and suspending, as has been done in some extreme cases, under the plea of urgent necessity, the ordinary regulations as to time, place, and other technical details, for the Conclave meeting after his death. Here, again, Mr. Innes has simply borrowed from Mr. Cartwright's book information with which our readers may already be presumed to be familiar. But when he makes the marvellous assertion that, "if the existing holder of the Papal Chair has the unlimited power of appointing, and also of deposing, the electors, the election is virtually left in his hands," we cannot but feel that there are other parts of Mr. Cartwright's instructive volume, to say nothing of the whole history of the Papacy, which he has studied to very little purpose indeed. In the first place, according to all precedent the Pope has no power whatever of "deposing the electors," though Pius IX. affected to do so in the notorious case of Cardinal Andrea—an arbitrary stretch of prerogative which would certainly have been called in question, and almost certainly disallowed, if the Cardinal had happened to survive him. In the next place, the elaborate and studiously complex machinery of election suggests *a priori*, what the unbroken experience of centuries confirms *a posteriori*, that it is simply impossible to conjecture—still more to decide—beforehand, who will prove the successful candidate. The last Conclave is a case in point. Gregory XVI. had reigned long enough to fill the Sacred College with "creatures" of his own, and the Conservative party, as it is called, among the Cardinals had an overwhelming majority, in spite of which the election fell upon that one of their number who

was reputed to be the extreme Liberal. It is, indeed, open to a Pope, if he so pleases, secretly to nominate his successor, and some very eminent pontiffs, like Hildebrand, have been requested to do so. But such an act could have no binding validity after his decease, and it is very unlikely that Pius IX., who is not lacking in Italian shrewdness, has taken a step the almost inevitable result of which would be to secure the rejection of his nominee, from the resentment of the Cardinals at such an interference with the freedom of election. That he may have drawn up, like some of his predecessors, a dispensing bull or brief as to certain technical arrangements of the Conclave is highly probable, though the necessity for using it does not at present appear very likely to arise.

So far Mr. Innes has not done much more than cite or paraphrase various passages of Mr. Cartwright's book, with a running commentary of some not very felicitous remarks and inferences of his own. But when he proceeds from these "internal questions" to consider the superseding by some external power of the rights of the Conclave altogether in the election of Popes, he touches on a much larger and more difficult question, and his treatment of it shows that he has got quite out of his depth, and is engaged in constructing with some ingenuity a paper theory which has no real relation to the forces actually in conflict. As a paper theory it may have its interest, but it sheds no new light on existing facts. That we have not at all exaggerated the scope of his article is clear from the concluding words, where, in reference to a statement that, whatever changes in the detailed arrangement may be designed, "the principle of the Conclave has been preserved," the writer observes, "What if Europe in the present—what if the Church in the future—should object most of all to that very principle?" He speaks accordingly of the great question of the validity of the coming election having been first raised by Prince Bismarck's Circular addressed to the European Governments in May 1872, claiming for them a right to control the legitimacy of the election, to which however they (very wisely) "gave, it is said, a negative reply." And then follows an account of a newspaper controversy on the same subject carried on between the official, or officious, organs of the German and Italian Governments three years later, which of course led to no practical result. Mr. Innes then goes on to explain more exactly what he means and desires. The primary question, he considers—the italics are his own—will be "that of recognition of the new Pope" by the different Governments, inasmuch as "disavowal of the tyrant—*déchéance*—is the proper response to tyranny," which ought therefore to have been adopted after the Vatican Council, only it was hardly possible to do so at the time. But "the whole course of the German protest against Vaticanism," as revealed in the Falk laws—which laws to many lookers-on appear quite as tyrannical as the Papal policy which afforded a pretext for them—"points to this as probable in the future, if not already anticipated." It is perhaps just conceivable that Prince Bismarck may contemplate something of the kind, but it will hardly be contended that the future of the Papacy rests with him. The essayist next appeals to the veto on Papal elections hitherto recognized—in usage, we may add, for it is not guaranteed by any written enactment—in the Crowns of France, Austria, and Spain. He omits to notice that this right could only be exercised once in each Conclave, and only against a candidate who had not yet been elected; and he quite mistakenly assumes that it is derived from the somewhat indefinite rights formerly claimed, and occasionally exercised, by the head of the Holy Roman Empire. To base on this wholly inadequate and partly fictitious plea a demand for an absolute veto, and something more than a veto, on future Papal elections, in behalf of the Protestant German Empire as heir by default of the defunct Holy Roman Empire, is nothing short of grotesque. The essayist has more reason for surmising that the Cardinals may not improbably demur to the existing claim of veto on the score of the altered relations of the Catholic Governments to the Church; and the fact, to which he does not advert, of no representative of the Catholic Powers being invited, according to former precedents, to attend the Vatican Council points in that direction. But the right of veto, as hitherto allowed, is hardly important enough to be worth any very severe struggle on either side.

The great object of the paper, however, is not to vindicate the claims of the Catholic States or of Protestant Germany, but of schismatic Italy—as the Vatican regards it—to an absolute veto, or rather, if we rightly understand him, an absolute nomination of "the Bishop of Rome and chief pastor of the Italian Church." Italy, we are told, "represents a native Church jealous of its original rights and claiming to have not a mere share, but a full election of the Bishop of Rome." And then follows a disquisition on the proper course for the Italian Government to pursue in the event of its judging the election of the Conclave to be invalid, and deciding to support the undoubtedly "preferable right" of the Bishop appointed by "the Christian people," that is, the people of Italy. Now certainly, if the question were simply of electing an Italian primate, the Italians might very well be left to settle the matter for themselves, nor would any outsider have much temptation to interfere. But it is precisely because the Pope notoriously is—we need not stay to inquire here whether he ought to be—a good deal more than an Italian primate, that Mr. Innes or anybody else thinks it worth while to discuss "the coming Conclave" at all. If indeed His Holiness should ever be reduced to that position, the discussion would *ipso facto* cease to have any general interest, but meanwhile it is absurd to speak as if the Italian Government or the Italian people had any exclusive or even

preponderating claim to choose the *de facto* ruler of an international and worldwide Church. Nor are we greatly impressed with the fairness and accurate appreciation of the due limits of civil and religious liberty of a writer who designates the Clerical Abuses Bill—we fancy he is wrong in speaking of it as a law already passed—as “a doubtful defensive measure, the necessity of which has been proved by the venomous Allocution since issued.” Even granting for argument’s sake the justice of his account of the Allocution, this is very like saying that the Star Chamber *e.g.* was a doubtful defensive measure, the necessity of which was proved by the venomous abuse it provoked from Prynne and other crop-eared Puritans.

But we have a final criticism of a purely commonsense kind to make on the essayist’s programme for the future ecclesiastical policy of Italy. Does he seriously imagine that it would work? An example nearer home may serve to illustrate our meaning. A serious controversy has been occasioned in this country by recent changes in the ecclesiastical law which have led a considerable number of the clergy and laity of the Established Church, rightly or wrongly, to question the claim of the personage holding office as Dean of Arches to be so entitled or to exercise the jurisdiction belonging to that Court. Their objections have already led to grave practical complications, and are at this moment being pressed, or about to be pressed, on the attention of the highest authorities in Church and State. Now let us suppose that their allegations as to the wholly novel and irregular method of Lord Penzance’s appointment were so absolutely unquestionable as to be in fact unquestioned, and that, instead of a large and influential party demurring to his jurisdiction, the entire body of the episcopate, clergy, and lay communicants of the Church, with a few insignificant exceptions, was unanimous in repudiating his claims and refusing all recognition of his authority. Is it not obvious that the Court, whatever its legal and Parliamentary title, would be reduced to a pure nonentity and would soon cease to exist even in name? Well, that would be just the position of a Pope appointed according to Mr. Taylor Innes’s suggestion, and recognized as such by the Italian Government; with this difference, however, that he would *ex hypothesi* be confronted by a rival elected in the ordinary manner, and whose claims would be all but universally acknowledged by the entire hierarchy, priesthood, and laity of the Roman Catholic Church. That there is the smallest likelihood of the Italian Government placing itself in so ridiculous a position we do not for a moment suppose. The essayist, as was observed before, is simply employed in building a house of cards, but as he evidently labours under the delusion that it is an edifice of solid stone, and may find some readers sufficiently ignorant of the facts of the case to agree with him, it may be as well to disabuse their minds at once of a chimera which can only damage the cause it is apparently intended to promote. The issue of the next Conclave will no doubt be a matter of European interest, but it certainly will not be decided by the short and easy method of superseding the Conclave and putting one or more of the Governments of Europe into its place.

THE SOCIETY FOR THE PROTECTION OF ANCIENT BUILDINGS.

WE have over and over again, in discussing Sir John Lubbock’s Bill year by year, spoken our mind as to the necessity of some provision for the mediæval as well as for the primæval monuments of the history of our island. And in the discussion of the Bill the point was raised more than once both by the friends and by the enemies of the Bill. Some said, Instead of protecting cromlechs and barrows, why not rather protect castles and abbeys? Others said, Why not, when protecting cromlechs and barrows, protect castles and abbeys as well? Either point of view starts from the position that mediæval monuments are at once worth preserving and also need some special care to preserve them. But the buildings which were in the minds of those who thus spoke on either side in the debate were doubtless mainly ruined or forsaken buildings—buildings which are not applied to any practical purpose of modern life. When men speak in this way, the chances are that by castles and abbeys they mean only ruined castles and ruined abbeys. To be sure there are at this moment some people who live in castles and others who live in abbeys; but that is altogether another use of the words. We will not go so far as to suggest that the members on either side who spoke of abbeys belonged to the sect which holds that no building can be an abbey till it is ruined, and that every building becomes an abbey when it is ruined. But we may be sure that it was mainly ruined abbeys that they were thinking of; they had in their mind Fountains and Tintern rather than Westminster and Tewkesbury. It is quite certain that, as a class, our mediæval monuments do stand in need of protection just as much as our primæval monuments. There are a few specially striking and famous monuments of each class which it is hard to believe that any man would press the rights of ownership so far as to destroy. But the smaller and less known objects of each class are in equal danger of actual destruction, while even those of each class which are in no danger of actual destruction are still in danger, both from mere neglect, and sometimes from attempts at preservation which, though well meant, are ill judged. But how stands the case with regard to those buildings which are still in actual use, be they churches, castles, town halls, houses, or any-

thing else? Do not they need protection just as much as the primæval remains and the ruined mediæval buildings? We may again make the same distinction which we made with regard to the two other classes. As far as actual destruction goes, the greater and more famous buildings are safe. There are some churches, castles, buildings of any kind, which no public body, no private owner, would venture to destroy. Public opinion would be too strong for the wanton exercise even of a legal right. But the smaller and less known buildings of this class are really in more danger than any other. It is hardly an exaggeration to say that our smaller domestic antiquities perish daily. If they stand on large properties, the owners perhaps never heard of them, and they perish at the will of some tenant or agent. In other cases, as constantly happens in towns where old houses are common, the owner himself is often some one who destroys without knowing what he is destroying, if indeed he does not see something clever in the act of destruction itself. Or again, sometimes ecclesiastical bodies will be seized with a fancy for destroying the subordinate buildings attached to their churches. Monastic buildings, prebendal houses, will fall one after another, because the dignitary or the dignitary’s wife either never saw them or fancies they would be better out of the way. In short, as far as actual destruction goes, all three classes, primæval monuments, ruined buildings, buildings still in use, are all in much the same case. Some examples of all three classes are safe enough; but a vast number of all three classes remain daily exposed to every kind of risk, from mere ignorance and carelessness, sometimes from actual love of destruction, sometimes, one may suspect, from that feeling which some philosophers say is the groundwork both of man’s benevolent and malevolent actions—the pleasure of showing that he has the power of doing either as he thinks good.

But the buildings which are still in use lie open to another and much more subtle kind of danger, danger at the hands, not of those who despise them, but of those who reverence them—not of those who do not understand them, but of those who do. Great and famous examples of this class are much more dangerously threatened by those who are inclined to take too much care of them than they are by those who are inclined to take too little. That is to say, while they are in no danger of open and avowed destruction, they are in great danger of that subtler form of destruction which masks itself under the guise of restoration. They are in no danger of being pulled down as wholes; but they are in danger of having their genuine details taken away bit by bit, and modern details—exact copies perhaps, but still new work and not old—put in their place. On this subject too we have often spoken our mind. We have often made our protest against the reckless way in which ancient work is made to give way to new in restored buildings, and especially in restored churches. We may be sure that, since the fashion of restoration set in, there has been hardly any restoration on a large scale in which a great deal of ancient work has not been destroyed which, with a little more care, might perfectly well have been saved. Sometimes this needless destruction is the fault of the architect himself, sometimes the fault of his employers, sometimes the fault of neither architect nor employers, but of builders, workmen, and the like, who have a fancy for making everything spick and span, and who will in some heedless moment destroy what both architect and employers wished to keep. These things go on daily; they are bad enough in England, and they are worse in France. Restoration has brought about so much destruction that it is no wonder that it has become a byword, and that in the minds of all who really care for ancient buildings the presumption has come to be against any so-called restoration; the man who designs to be a restorer must prove that he is not likely to be a destroyer.

Things being as they are in this matter, it is not wonderful if some have gone so far as to condemn all restoration altogether, to argue that, at the utmost, nothing should ever be done to an ancient building beyond such mere repairs and strengthenings as may keep it from falling or hinder the rain from coming in. Mr. Ruskin, many years back, put forth this doctrine with all the vehemence of his rhetoric; indeed we are not clear that he would have allowed such mere substantial repairs as we have just excepted. In Mr. Ruskin’s view it was better to pull down an ancient building than to restore it. Whatever the pulling down was, it was not a lie, while the restoration was a lie. The same line is taken, with less of rhetoric but with more of argument, in a paper now before us which contains the prospectus of a “Society for the Protection of Ancient Buildings.” The Society as yet boasts of no President; but it has a Committee and a Secretary, the Secretary being Mr. William Morris, while on the Committee are the names of Mr. Carlyle, Mr. Stopford Brooke, Mr. Sidney Colvin, and Mr. C. J. Faulkner. The paper is well worth reading; it is a calm, clear, and logical statement of one side of a case; but to our mind it leaves out the other side. It is unlike some pleadings which break down of themselves before the answer comes, for it is thoroughly good till we get the answer; but we certainly think that there is an answer.

The argument, if we rightly understand it, runs thus:—Architecture as an art died out just as the study of architecture as a branch of history began. Therefore in our age, while we know historically about all earlier styles better than any age did before, while we respect and admire the buildings of all earlier times more than they ever were respected and admired before, we have, unlike all earlier times, for practical purposes no architectural style of our own. In other ages men knew more of the art and less of the history. Architecture was to them the practice of a living art, not

the study of a past history. Their own style was to them a living thing; it was the only style which they knew how to work. They therefore freely destroyed, altered, added to, the buildings of former times, and they did it always in the style of their own age without regard to the style of the earlier work. They destroyed and rebuilt, but they destroyed and rebuilt openly and honestly. The new work announced itself as new, and did not pretend to be the old or an imitation of the old. Each building in its successive changes has a history, and the history of many buildings is the history of the art itself in its successive styles. Even the latest and worst changes thus had their historical value. In a modern restoration, on the other hand, having no style of our own, we cannot in the same way add and alter in our own style. What we profess to do is to bring the building back to the state in which it was at some particular point which, either in the general history of the art or in the history of the particular building, is held to have been its highest point. We thus wipe out the history of the building by destroying everything later than the chosen point, and putting in its stead something which is a modern imitation of the style of the chosen point. Furthermore, we often actually destroy work of the chosen period itself, if it is at all decayed, and put modern work in imitation of it in its stead. This is artistically a forgery. It is further unreal, because the real life of the ancient building sprang largely from much in the religion, thought, and manners of past times, which has passed away hopelessly and for ever; it is therefore unreal to restore what directly sprang from those lost feelings, and what, without them, has no life or meaning. We must then never restore; we may only repair. We may prop a falling wall; we may mend a roof so as to keep it weather-tight; but we must do all this as mere physical repair, without any attempt at art, above all, without any attempt of imitating the art of any past time. We must, in the words of the paper itself, determine "to resist all tampering with either the fabric or ornament of the building as it stands; if it has become inconvenient for its present use, to raise another building rather than alter or enlarge the old one; in fine, to treat our ancient buildings as monuments of a bygone art, created by bygone manners, that modern art cannot meddle with without destroying."

This, we think, is a fair statement of the argument of the proposed Society. As we said, the argument is perfect from its own side. If buildings were simply historical monuments of art, if they were simply, like paintings, statues, monuments of art of any other kind, valuable for their beauty and their history, but serving no practical purpose, the argument would be unanswerable. It is what we have often thought and often said with regard to those buildings which are simply pieces of art, pieces of history valuable only for their beauty, their antiquity, the light which they throw on the history of art and on history generally. The argument applies in all its fullness to buildings which are purely monumental, to buildings which serve no practical purpose—that is, in other words, to buildings which, whether strictly ruined or not, are disused and forsaken, and which it is not desirable to take into use again. It applies to ruined castles and to ruined abbeys. Those ought to be dealt with simply as monuments; they should be carefully preserved from further decay, propped it may be when propping is needful, but never restored. They belong wholly to the past; the present has nothing to do with them except to keep them up as monuments of the past; no modern work should be allowed to intrude upon them except such as may be physically needed to keep the ancient work from further decay. Such modern work should proclaim itself as modern work put there for a purely physical end, and should not in any way attempt to reproduce an imitation of the ancient work.

But, as it seems to us, in the case of those buildings which actually are and immemorably have been applied to practical modern uses, other considerations come in, which are wholly forgotten in the appeal of which we have just attempted a summary. The consequence of the argument which we have just gone through would be that, when any ancient building, church, hall, or any other, needed repairs somewhat more extensive than mere propping or roof-mending, it must be forsaken. The paper talks very calmly of "raising another building rather than altering or enlarging the old one," whenever the building has become inconvenient for its present use. By the same argument we must do the same wherever any part of a building needs, as is often the case, to be rebuilt. When the mid tower of Chichester Cathedral fell, according to this argument it ought not to have been rebuilt. If the same accident had happened in any age which had a style of its own, then it would have been lawful to rebuild the tower in that style. As we have no style, and must not imitate any earlier style, we must not rebuild the fallen tower. That is to say, the minister of Chichester ought either to have been forsaken altogether, or possibly to have been turned into two distinct churches east and west of the ruined tower, leaving the ruined tower untouched in the middle. This would seem to be a logical consequence from the arguments before us. Or, if there be any alternative, it would be to build a tower so ugly, and so utterly without any architectural style at all, that it should at once proclaim itself to be a mere nineteenth-century repair. We cannot think that the promoters of the proposed Society would go this length; and yet one or other of these courses would naturally follow from their principles. If the like accident had happened to a ruined and forsaken church, we should of course say, do not rebuild the fallen tower. But the paper says, "When a building has become inconvenient for its present use, forsake it, and build another." Chichester Cathedral

did, by the fall of the tower, become very inconvenient for its present use. Yet we cannot believe that any one would seriously argue, either that the church ought to have been forsaken altogether, or that the tower should have been designedly rebuilt in some hideous fashion, to the spoiling of the general effect of the building, simply lest some one should mistake the new tower for an old one.

The truth is that buildings which are actually in use—churches, houses, halls, or any other—while they are monuments, are something besides monuments. Or rather they are monuments in two ways, one of which is forgotten in the present appeal. Westminster Abbey and Westminster Hall are monuments of ancient art; but they are also monuments in another sense; they are monuments of the continuous history and life of the English nation. According to the argument before us, if Westminster Abbey should need some work greater than mere physical repair, it ought to be forsaken; it should be left cumbering the ground and doing nothing, while a new place should be built for the crowning of our kings. Surely this would be a far greater sin against all historical feeling than to rebuild some part of the building where rebuilding was really necessary. A window is blown in, a pillar will no longer stand the weight upon it. Is the abbey to be forsaken, and something new built instead, rather than make a new window or a new pillar? Or if we are allowed to make a new window or a new pillar, are we bound to make something incongruous of set purpose, lest anybody should mistake it for ancient work? Surely no one will defend either of these courses. When a building is still in use, its continuous use is part of its history; in truth, it is the very first and greatest part of its history. The continuous use of the building is more monumental, more historical, than anything else. Whatever, therefore, is necessary for that continuous use must be fearlessly done. We must keep the building whole and sound by necessary repairs; and surely it is not too much to add that, when those necessary repairs imply the reconstruction of some artistic feature, we should not wantonly disfigure the building by making the new column, window, or doorway ostentatiously ugly, ostentatiously out of harmony with the rest. In short, while a forsaken building belongs wholly to the past, in a building which is still in use the past and the present both have a share and neither must be sacrificed to the other. Or we might put it that the past has a twofold claim, one side of which is forgotten if we are to forsake an ancient building rather than to restore the smallest portion of it.

We say then that the principle of restoration is, within its fitting range, perfectly sound, only, like a great many other things, it needs to be very carefully watched. As a matter of fact, a great deal of destruction has been done under the guise of restoration. To check further destruction of the kind is a good object, and if a Society can do anything to further that object, we shall wish all good luck to such a Society. But it must not go too far. Let it watch all restorations, let it check all needless and destructive restorations; but when we are told that it is better to forsake an ancient building, and we suppose let it fall to ruin, rather than do any restoration at all, then we must draw back; such a rule wounds our historical sentiment even more than the destruction itself.

PERSONAL INTELLIGENCE.

PERHAPS one of the most conspicuous features of American society at the present day is the avidity with which any kind of personal scandal or gossip is sought after and plotted over. In some degree this passion may be inherent in the national temperament, which is prone to sensational excitement and the indulgence of an insatiable appetite for wonders; and it has also been most industriously and unscrupulously cultivated by the American press, which finds it a profitable source of income. The fierce light which is said to beat upon the throne in a monarchical country like our own is only a mild illumination in comparison with that which in the Transatlantic Republic sheds a glare over the most private and sacred recesses of human life. Public men seem to be valued over there not for their talents or usefulness, but merely in proportion to their faculty of providing popular sport; and even the most obscure and insignificant creatures have a chance of distinction if they can only at a dull moment tickle the vulgar curiosity of the multitude. A lenient feeling is shown towards such notoriety as Fisk, Tweed, Beecher, Tilton, and the like, simply in gratitude for the morbid interest which they excite; their conduct and reputations are regarded without reference to the rules of practical morality in real life, just as if they were merely characters in a novel or actors on the stage; and the more intense the thrill which is given by any particularly bold display of criminal callousness or shameless impudence, the more they are appreciated. Any one who studies the American newspapers will see how this way of looking at things pervades the community. It is sometimes said that the press of that country is not to be taken as a fair representation of the inhabitants generally, and it may be true that it has not much actual political influence; but it is evident that such papers could not obtain the large circulation which they enjoy if they did not appeal to the popular taste, and what that taste is it may be worth while to show.

One of the chief attractions of American journals is the column headed "Personal Intelligence," which contains such paragraphs as the following, taken from the *New York Herald*:—

"Logan walks slowly." "Nasby does not always trim his beard."

"Evarts swears at a shirt-button in hexameters." "A son of the late Hon. Henry T. Blow, of St. Louis, has gone looney on Alice Oates, the actress, and follows her around offering her costly presents." "Senator Cameron talks with his under jaw, as if he were trying butter." "Colonel Corbin, the new military Secretary at the White House, is a contrast to his predecessor. He is tall, like a grenadier, with a mustache." "Cronin is hard at work in Oregon, but the size of the nose hangs round him still." "The Princess of Wales recently wore calico, which was very nice of the Princess." "General McClellan got out of a cab at Twenty-third Street, a week ago, meaning to walk down Broadway. He has not started yet, because there are two aides to the street." "Beecher lectures on 'Hard Times' and charges a dollar and a half." "Sunset Cox folds up his wings like a giraffe and lectures in Georgia." "Kilpatrick is little and thin." "Evarts has not a small nose." "Ben Butler is no longer beautiful." "Senator Sharon is at his 7,000,000 dollars hotel in San Francisco."

There is a daily supply of personalities of this kind, and the most private particulars about all sorts of people are hawked about. The detailed accounts of Vanderbilt's death-bed and of the cremation of Baron von Palm will be remembered. All the nasty parts of the Beecher story were also made an article of trade; and the New York papers are just now full of personal details as to the mysterious disappearance of ex-Mayor Oakley Hall. He was last seen by his family on the morning of Friday, 16th March; quitted his office about seven o'clock in the evening; was traced to Boston, and has since kept out of sight, though it is supposed that he has arrived in this country. All sorts of theories have been started to account for this strange incident—that he has gone off in a fit of mental aberration; that he has been murdered; that he ran away with a pretty actress; that he is hiding from his creditors; that he has fled from justice as one of the confederates of the Erie Ring; that he is afraid of being mixed up with Tweed. All his friends come forward with stories of his character and antecedents, some not particularly favourable; and it is noticed as a suggestive circumstance that the name of a lady, which is given in full, has just been published as a client of Mr. Hall, seeking a divorce. "Who this lady is," it is added, "is a profound secret. Neither her name nor her husband's appears in either the Brooklyn or New York Directories." Poor Mrs. Hall is subjected to daily interrogatories from a stream of reporters and other intrusive visitors as to whether she has heard where Mr. Hall is, or can give any idea of the cause of his departure. "The Hall mystery," we are told, "is a mystery still, and the theories to account for the unexplained and prolonged absence of the missing ex-mayor still grow in number and variety," though "the vast majority of intelligent people who were heard discussing the event yesterday in the courts, at hotels and theatres, still cling to the opinion that Mr. Hall had absented himself for some reason or other, and would turn up before many days were over." One man said that Hall was too wide awake to allow himself to be murdered, and another remarked that he was at least too sharp to commit suicide; so they agreed that he must have bolted to Europe. The present inquiry expressed the opinion that, if it had been any man besides Oakley Hall, he should have supposed that he had had foul play; but he was such a practical joker that he would be sure to turn up again. An actor, very intimate with Hall, said he was fond of travel and change, and he might have gone to Europe, and, through a whim, failed to acquaint his family with his departure. A legal friend suggested that he had gone on a journey on behalf of some client. After a few days a report gained credence that the ex-mayor had engaged a passage at Boston in the *Victoria*, a freight ship, for Liverpool; and a telegram dated from Liverpool on March 31 announced that a person with about a fortnight's growth of moustache and side-whiskers, and dressed in dark clothes, and spectacles—Hall usually wore eye-glasses—who went under the name of "Sutcliffe," but had been identified as Hall, had arrived in the above-named vessel. This person, however, indignantly denied that he was Hall; and was tracked to Euston Terminus, and thence to Notting Hill station, where he took a hansom cab and drove to "a small, quiet, private house near by," where "he was evidently expected, as the door opened without ring or knock, and he passed in immediately with his luggage." It may easily be understood how doubtful such information was; and, besides, it was only a conjecture that this was "Sutcliffe" or that "Sutcliffe" was Hall. It will be observed that ex-Mayor Hall, having ceased to be a public officer, is merely a private person who has a perfect right to go where he likes without taking everybody into his confidence. Yet we find all sorts of discreditable stories published in the papers to account for his disappearance. One journal goes so far as to say that it is plain what was his object in getting beyond the reach of the police, and to charge the absent man with having repeatedly affixed his signature to blank warrants, which were filled up afterwards by members of the Ring, his share of the plunder being handed over to him in the form of fees paid to a law firm doing a large business. An odd consequence of Mr. Hall's sudden departure has been, if we may believe the local papers, that "on the heels of the Hall mystery have followed a series of mysterious disappearances until there are more people reported missing now than were probably ever before in the history of New York." This is no doubt a fanciful epidemic invented to keep up the excitement of the Hall question. The Associated Press reporter who had identified Sutcliffe as Hall at Liverpool, and discovered that he had changed his name to "Garbett," saw him with a young lady in Hyde Park. On April 4th, he left a note for Mr. Hall requesting an interview, in an envelope addressed "Mr. Garbett," to which a reply was returned in a woman's handwriting, to the effect that the gentleman whose name was on the envelope "had no concern with the enclosure, and therefore respectfully returned it, that an

evident mistake may be rectified." The woman is thus described:—"She is about thirty-eight, five feet five inches in height; of good figure; has dark brown hair, clear complexion, large eyes, large mouth, and a wart behind the left ear." The London Correspondent of the *New York World* professes to have been more successful in his efforts to see Hall, and telegraphs from London that he had obtained a protracted interview with A. Oakley Hall, who, "under the name of Garbett, now occupies lodgings in the neighbourhood of Notting Hill Gate, a cheap locality, made up of small houses only"; but that Hall "absolutely refused to make any explanations whatever as to his motives in leaving New York, and seemed altogether at sea as to his future plans." The Correspondent adds that "he is evidently much broken in mind and body, and desires only rest and peace." He also suggests that "it is now only charity to say as little more about him as possible," as to which the Correspondent himself, though he seems to overlook it, might very well have set an example.

Another example of the system of "personal intelligence" by which the American public arrives at conclusions quite independently of legal evidence and judicial supervision is given in the case of Tweed. It will be remembered that Tweed escaped from gaol in last December, and was afterwards caught in Spain, and once more lodged in Ludlow Street prison. A recent number of *Harper's Weekly* contained a narrative of Tweed's flight and capture, purporting to be based on a diary and other documents supplied by the prisoner. In this statement, which was immediately copied into all the newspapers, it is represented that at the end of last year Tweed had got tired of battling for years in the courts of law, and had also sacrificed a large part of his means. He had then the prospect of a six-million suit against him, and saw himself drifting to irretrievable ruin; but, as a last hope, he thought that, if he only got out of prison, he might save some fragments of his property. One of his messmates in the prison was Lawrence, the silk smuggler, whose case led to the abrogation of the Extradition Treaty with England; and another was Bliss, a notorious swindler and burglar; and, with the help of these congenial friends, a contract was made for Tweed's evasion. He was, being a privileged prisoner, to find occasion to visit his house in town, of course under the charge of warders; and was then to slip out, and be taken in charge by a well-organized body of men distributed throughout the country. This plan was carried out; the warders were treated to a luxurious feast, and Tweed went out of the room on pretence of washing his hands; but instead he passed into the street, where a waggon was waiting for him, and he was driven to the North River. There he crossed to New Jersey, and was conveyed into the country beyond the river and the Palisades, where he put up at a secluded homestead, and remained till about the first week in March, assuming the name of "John Secor," and having his whiskers shaved off and his hair clipped short, while a wig and pair of gold spectacles completed the disguise. He afterwards made his way to Cuba, and got a steamer to Vigo, where he was arrested and put in prison by the Spanish authorities. The account goes on to show that since his return to incarceration in New York he has lived in perfect seclusion and absolute silence; but he wrote a letter to Charles O'Connor, one of the parties to the pending suit against him, proposing an absolute surrender on his part; that is to say, to give up to justice all he has, and tell all he knows; and throw himself on the clemency and generosity of the authorities. In making this offer, he pleads that he is "an old man, greatly broken in health, cast down in spirit," and unable any longer to bear his burden. At first Tweed's melancholy story created a feeling of sympathy and compassion, and it was reported that he would soon be released. According to the latest news, however, the story is in the main pure fiction, and the law is to take its course. What will strike people out of the States as the most astounding feature of the affair is that the publication of an unauthenticated letter, and a discussion about it in the newspapers, should be allowed to cut the knot of a regular judicial investigation. There are unfortunately some symptoms of a similar taste for personal scandal springing up in this country; but the disgraceful point to which it is carried by American journalists may perhaps be a warning.

JAMAICA PLANTERS.

FEW things can be more depressing than the aspect of a country that has "seen better days"; and perhaps there may be an added touch of melancholy when it shows some fitful signs of recovering itself. In the case of the man who is going fast downhill, in shabby clothes and with a shamefaced demeanour, you have the sense that accelerated decay will soon bring him the relief he must long for. But a country, though overshadowed by a gloomy destiny, may prolong a painful agony indefinitely; and the greater its natural chances and advantages, the more sensibly do we feel for it. We have no idea of entering into those vexed economic questions which have been lately in course of discussion in the *Times* under the heading of "Jamaica Planters." But every controversy of the kind, whether it throw more or less of light or shadow on its subject, can hardly fail to suggest some sad reflections as to the change that has been brought about in half a century in one of the most enchanting spots on the globe. Most of the regions lying anywhere in those seas and latitudes have had hard luck since they made the acquaintance of Europeans. The wars of Sweden and Prussia

invasion passed over the mainland of the neighbouring continent, submerging such arts and civilization as had been possessed by the native races. Brazil has lifted her head again under European rule, thanks partly to the establishment of a European dynasty. But as for Mexico, and those South American Republics which owed their independence to the intrigues of degenerate Spaniards, taking advantage of the embarrassments of a feeble home Government, we know what has been the fate of the New World that Canning boasted of having called into existence. A mongrel race, enfeebled by a relaxing climate, has become the prey of adventurers and the sport of revolutions. Great natural riches have been running to waste, or have been selfishly traded upon by interested adventurers. Credit has been anticipated or exhausted, with such happy exceptions as that of Chili; public works, indifferently constructed, have fallen into disrepair before they had a chance of paying; the old pestilential swamp is soaking through embankments and swallowing systems of drainage; the jungle is rapidly gaining on the ground that had once been reclaimed from it; the wharfs are crumbling away, and the harbours are silting up which were once the seats of flourishing commerce. As for the Pearl of the Antilles, with those seemingly inexhaustible resources which used to go so far towards rectifying Spanish Budgets, it is the scene of a struggle which, should it come to an end, can only leave the island in utter exhaustion. But, to an Englishman at least, the decline of Jamaica comes home far more nearly. We have no intention of moralizing at this time of day for or against the institution of slavery; although we must recall the fact that it was forced upon our West Indian colonists by their local laws, and that no man could acquire a sugar estate without acquiring at the same time the slaves who worked it. We pretend to do no more than take a glance at the island as it was fifty years ago, as contrasted with what it has sunk to at present.

And we do not think we can do much better than take "Tom Oringle" for our text. "Tom Oringle" (Mr. Scott) was a West Indian of course, and he wrote feelingly when he touched on the politics of a subject in which he was vitally interested. He may have painted the planters in rose colour and made the best of their treatment of their slaves. But his imagination, had it prostituted itself to self-interest, could never have made so vivid a picture, and in every chapter of his we are irresistibly impressed by the pervading sense of thorough fidelity. As for the scenery he so admirably describes, about that there can be no question whatever. If ever the lot of man was cast in an earthly Eden, it was in the instance of those well-to-do planters of the "land of streams." It is true that there were snakes to be found in it, both literally and metaphorically. Residence in towns like Kingston was by no means entirely agreeable. In spite of the refreshing breath of the evening sea breeze, a taint of the miasma from the bush and the lagoons hung over such shadeless cities. For there was little shelter in the blazing streets, and you had to go through your mercantile drudgery in the airiest of costumes, occasionally gasping for breath behind your closed blinds. But that was only the misfortune of the exotic aristocracy of the community. What was temporary suffering to the white man was but the breath of life to the blacks. The negro revelled in his glowing atmosphere; and, as with the *lazzaroni* of Naples, the heat only added to his enjoyment of existence, although it may have heightened his aversion to labour and his natural predisposition to indolence. And, if the white merchants had to put up with some discomforts, they had the consolations that come of a successful career and an assured future. They had only to put the energy of their nation into their duties, and money came pouring in by handfuls. The roadsteads and the harbours that seem so deserted now were filled with the English shipping they had chartered; the vessels from the Severn, the Mersey, and the Clyde lay anchored in clusters in the offing, or moored in tiers off the wharfs. There was a constant coming and going to the blocks of great warehouses; and strings of drays and teams of mules from the districts in the interior were perpetually discharging their loads at the vast sheds on the quays. Those West Indian merchants led lives that were all the more jovial for their efforts; for, as was remarked by the immortal Jacob Twigg of the "Dreum," the West Indians held their lives by so precarious a tenure that they had learned to set little store by their purses. They went to their daily work betimes, and had earned the luncheon at which they kept open table for all and sundry. In the afternoon, when they had shut up their lodgers and locked their safes, they drove out to their "pens," or houses in the country, where they dined with doors opening on the verandah, commanding splendid prospects of the sea, and slept in rooms that were ventilated by the breezes. As for their subordinates, who had narrower means for the moment, they were tolerably well paid notwithstanding, and had the world of Jamaica before them, with a moral certainty of making their living in it. The one condition of their rise was steadiness. For when men held a plurality of properties, or were in the occasional habit of absenting themselves for a long holiday in the old country, trustworthy overseers were in constant request.

The life of the planters was even more enviable. The picturesque scenery that facilitated their ruin by offering the emancipated slaves every opportunity to squat gave existence an indescribable charm. Jamaica, with its well-watered mountain ranges, its park-like stretches of timbered guinea-grass, its cliffs and cataracts, its luxuriant woods and natural orchards, where delicious fruits hung in tempting profusion amid grand masses of foliage, presented an infinite variety of eminently eligible building sites. If you preferred

the beautiful to the more practically profitable, you could leave to the charge of the manager the rich flats and the bottoms where the cane-brakes and coffee plantations surrounded the boiling-houses and negro villages, and settle yourself on some romantic grazing property sequestered among the breezy heights. There you might admire to your heart's content the changing atmospheric effects and the play of tropical lights on the grandest scenery decked in the richest colours. Before the shadows of the night came down, you saw everything through a transparency of preternatural clearness, as it kindled in the glow of the gorgeous sunset. Very probably you woke up in a dripping mist, that brought life and freshness to the drooping vegetation; and you might watch the veil lift and drift away under the influence of the sunbeams, while it left the landscape sparkling in showers of dew-drops. Of course you had to run the chances of disease, for it must be admitted that the inexorable figures of the Insurance Offices indicate the insalubrity of West Indian residence. Now and then, and independently of the normal risks of ordinary fever, the "Yellow Jack" made its visitation to take tithe of the community. Everybody had not the luck of Lieutenant Oringle, who gives so telling a description of his seizure and prostration by the *vomito prieto*, although he adds that it was almost worth while to have been struck down that you might taste the ineffable pleasures of convalescence. But familiarity with these formidable scourges bred disregard, if not contempt, among our colonists; and it must be confessed that the guiding maxim of their lives was *dum vivimus vivamus*. Jamaica was the chosen home of hospitality, and they spent their fortunes with princely lavishness. Every respectable stranger was made heartily welcome, and the faintest form of decent introduction passed one freely all over the island. These sumptuous traditions linger still; so that, although the means of the planters have been so terribly crippled, to this day the "taverns" of Jamaica are among the most comfortable inns in the English settlements. The mystery to men bred in the temperate zone is how they managed to sustain their excellent appetites and keep their livers in tolerable order. Probably beneficent nature assisted them by promoting a free flow of transpiration. But it is certain that, before or since, there has seldom been such luxurious housekeeping. The mouth waters as one recalls such banquets as were marked with a white stone in the memory of Mr. Pepperpot Wagtail. There were tropical delicacies of every kind; turtle and terrapin, landerabs and ringtail pigeons; gropers from the sea, and mullet from the mountain streams, stuffed with savoury vegetables or swimming in claret sauce. As for the varieties of their desserts, the whole of the island garden was before them, and we can imagine what a *diner à la Russe* might have been spread with the produce of its magnificent natural orchards. And as for the wines they had to import, they were the best customers of the wine merchants before the days of cheap vintages. It was well worth making the West Indian voyage only to taste the marvellous Madeiras that had repeatedly made the round of the Cape before being deliberately mellowed in the cellars of that sultry climate. As a proof of the tender devotion which its fragrance inspired in its grateful votaries, we revert to our boyish recollections of the English seat of a West Indian millionaire, who had anticipated, by a time y sale of his estates, the emancipation of the negroes and the abolition of the sugar duties. His beautiful grounds were studded with empty Madena pipes, which he had set up in the form of summer-houses for the sake of fond associations.

Nor had the lives of the planters, although it has been the fashion to throw stones at them, only their selfish and self-indulgent side. Many of those Englishmen had carried with them to the tropics the kindly feelings of the English squire; and generally the sense of possession and absolute ownership gave somewhat of a paternal character to their dealings with their woolly-headed dependents. Had there been no better motive, the consciousness of easy prosperity inclined them to be liberal to the people about them. They may have been autocratic and arbitrary, and too frequently licentious; but, generally speaking, it was their pleasure to live among comfortable scenes of material prosperity. The slaves were well fed and well clothed, according to the conditions of the climate. Their wives and daughters were usually on the broad grin, and the sleek and shining picaninies rolled about in picturesque nudity, enjoying the spring-time of their lives in the exuberance of their animal spirits. The people had almost invariably their own provision patches, with a day in the week to cultivate them; the pigs that fattened on the profusion of surplus vegetables made themselves as thoroughly at home in the huts as they do in the Irish cabins; and if he thought his freedom worth the purchasing, an industrious slave could usually buy it. We are far from asserting that there were no abuses; we set out by saying that there were snakes in the paradise. But, with the prevailing tone of opinion in a community of free-hearted English gentlemen, cruel or tyrannical treatment was the exception, and a monster like a Legree was an almost inconceivable phenomenon.

There is unhappily no need to expatiate on what Jamaica has become in our own time. The present conditions of existence with the struggling white settlers are pretty much the reverse of the opulence we have described; just as the bush has been spreading over abandoned cane-fields, and as the shipping in the ports is the spectre of what it once was. But what remains unchanged is the spirit of hospitality, as Kingsley has described it in his *At Last* and Mr. Trollope in his *West Indies*. And it shows itself the more genuine that it has to contend with difficulties and involves self-sacrifice, as one of the planters who had made him heartily welcome

plaintively remarked to Mr. Trollope in a moment of confidence. Bills overdue, hampering mortgages, fierce competition against long odds; anxieties about the labour supply, and troubles with the field hands when the ripening crop is threatening to rot; costly improvements in modern machinery—all these things must weigh like nightmares on the troubled slumbers of the present generation of planters. It is possible that they may have happier times in store; but there can be no question that the golden age is over for them, nor is there any likelihood of its ever returning.

OPERA LIBRETTI.

IN the history of musical literature there is no more deplorable chapter than the story of the opera libretto, or "book of the words." At a first glance what would seem a more harmonious fellowship than that of poet and musician? "Music and Poetry," wrote Purcell, in the dedication of his opera of *Diocletian* to the Duke of Somerset, "have ever been acknowledged sisters, which, walking hand in hand, support each other . . . Both of them may excel apart, but sure they are most excellent when they are joy'd." The poet's share, however, in this union of the arts appears to have been but a shabby one. Instead of union, disunion, small squabbling, and jealousy, or at best a most unequal, ill-assorted companionship, mark the occasions on which the musician and the poet have sought to strive together in the service of the dramatic muse. Your great poet, indeed, has preferred to chant his strains alone, and looked askance upon an art which might but twist the delicate web of his verse into new forms, and throw the careful design out of all significance. So it has come about that poetasters, dwellers on the lowest slopes of Parnassus, nay, mere groundlings of the level mead, have run to the rescue, and sought immortality by uniting their weak babble to the musician's heaven-drawn harmonies.

This disappointing failure, where success would have seemed a reasonable expectation, may be traced to many causes; the artificial nature of the *genre* opera itself, the singular lack of mutual understanding between dramatist and musician, each misapprehending the possibilities and limits of the other's art, and the dependence of both upon those most capricious of all instruments—singers and actors. It must be confessed that in the first stages of the musical drama the poet had little chance. The origin of the so-called opera was the dramatic cantata of the Italian Courts, a performance invented at the close of the sixteenth century for the amusement of a *dilettante* luxurious society, and consisting of airs to be sung by favourite singers, connected by spoken dialogue or recitative and enlivened by ballet. The poet's thankless task in this heterogeneous composition was to take the *dramatis personæ* already fixed for him by the pseudo-classic taste of the day, and supply them with some sort of framework on which the required number of airs and the due amount of dancing could be brought into an intelligible whole. For a real dramatic organism there was here evidently no chance; stereotyped musical forms became fetters for musician and poet alike, and, at the outset of an art which professed to be founded on the Greek stage, the essential dramatic element was left out. Dr. Chrysander has well shown how in Italy, the birthplace of opera, the groove in which the natural dramatic tendencies of the people had run proved both a facility for the creation and a bar to the development of the musical drama. The Italian Theatre, he says, had possessed for centuries a number of ready-made personages beloved by the nation and well understood. The classic gods and heroes retained, truly, but little of their historical identity, but they became gradually moulded into typical characters which signified something real to the people. The Italian drama was like a chest in which the puppets lay packed side by side, and according to the need of the hour the right puppet would be pulled out and dubbed pastoral, mythological, tragic, or comic, touched up with local colour and supplied with speech by the showman. This stereotyped dramatic material gave to the Italian stage its fatal incapacity for improvement from without, and also its individual strength. For the first attempt at opera no especial musical form was ready, but the dramatic form and the established stage were ready; consequently in the first century of opera-making there is no development. On the *Pastor Fido* of Guarini, 1579, more than a hundred operas were composed. Under these circumstances the librettist, otherwise the poet, was a nonentity. Handel's opera of *Agrippina* is entered in the catalogue of the Venetian musical dramas, Anno 1710, *Agrippina*, 441, *Teatro S. Gio. Grisostamo*, 56, *Poesia d'incerto, musica di Giorgio Fed. Hendel*. The wonder is that Handel and his contemporaries of note could be satisfied to compose at all on the wretched literary framework offered to them; but it may be remembered that the classical stories in vogue had a true dramatic core, however husked over and hidden; also that Italian versifiers had ever a rare trick of scribbling words pleasantly adapted for the delivery of musical phrases, and sufficiently true to a prescribed sentiment to allow the composer free scope. As a matter of fact, however, the dramatic power of Handel first found full play when he betook himself to the Bible, where, as Bach before him and Mendelssohn after him, he discovered the forcible imagery, the rich expression, the tragic feeling which the secular poetasters of the day failed to supply. Yet even in the bypaths of sacred history the compilers of Handel's text contrived to lead him a fool's dance, as in the ludicrous philandering of Solomon and the Queen of Sheba, or the pompous patronage of Ahasuerus.

England, accounted the most unmusical of countries, might per-

haps have achieved the production of a national musical drama if Henry Purcell had fallen on better days. But though that undoubted genius drew his text from Shakespeare, Ben Jonson, and Beaumont and Fletcher, understood the true gist of dramatic composition, and wrote with astonishing freshness and vigour, yet the frivolous influence of the Court, given over to French ballet, the want of vocal method among English singers, and his own mistaken impulse towards the Italian stage, were fatal to the development of the new form of art. The spirit with which Dryden defends his text-book to Purcell's *King Arthur* amusingly exemplifies the low level at which writing for the musical stage was set:—

The numbers of poetry and vocal music [he writes] are sometimes so contrary that in many places I have been obliged to cramp my verses and make them rugged to the reader that they may be harmonious to the hearer, of which I have no reason to repent me, because these sorts of entertainments are so principally designed for the ear and eye, and therefore in reason my art on this occasion ought to be subservient to his; and besides, I flatter myself with an imagination that a judicious audience will easily distinguish betwixt the songs wherein I have complied with him and those in which I have followed the rules of poetry in the sound and cadence of the words.

The spectacle of Dryden consoling himself for his damaged metres by trusting to the discrimination of a London audience to throw the blame on the musician raises a smile at his expense. Purcell died in his seven-and-thirtieth year, and the chances of national opera vanished with him in the dust-cloud raised before the advancing troops of foreign singers.

The London theatres witnessed strange scenes when the Italians had assumed possession of the musical stage. The male sopranis and their companions who took the ear of the town could only listen in their native tongue, while the English were equally incapable of mastering a foreign language on short notice; so every one sang "wie ihm der Schnabel gewachsen war," and the text-writer had to string together into a whole the favourite arias, duets, &c., of the foreigners, with additions for the English *personnel* in a jargon worthy of Babel. Little wonder that the tasteless hotchpotch roused the ire of Addison, who had not sufficient musical knowledge to distinguish between the compilations of ignorant scribblers and conceited singers, and the consistent, if narrow, Italian art which they travestied. Addison in a fit of patriotism wrote the text of a musical drama himself—*Rosamunda* by name—but again fate forbade a wholesome union between sense and sound, for the composer selected by Addison was a vulgar nonentity, one Tom Clayton, whose bad music killed the drama off the boards in three nights. After a while the numbers of Italian singers increased to such an extent that one entire "opera"—a name imparted with the foreigners—could be given in Italian. The first work thus rendered was *Hydaspes* by Marcioli, which was brought over by the great actor and singer Nicolini, and produced on the stage in 1710. When Handel arrived in England with his armful of Italian operas in the grand style, the stage was ready for him.

The honour paid to Gluck as a regenerator of the musical stage from a dramatic point has of late reached its highest pitch. He threw off the tyranny of singers, made them merely "spokesmen of his dramatic and musical intentions," and brought music into direct connexion with the poetic sentiment of the words. Herein he found an able and sympathetic coadjutor in Calzabigi, whose libretti are exceptional for real dramatic vigour. It has been said that the successors of Gluck, Cherubini, and his co-disciples "allowed the poet to develop in the exact ratio of their own increase of musical freedom and strength." It is, in fact, notable that the conventional musical forms into which the musical drama had settled down as Italian opera became hindrances to development in a dramatic direction for both musician and poet. Even the genius of Mozart is unable to blind us wholly to the artificiality of the stage stereotyped arrangements, while we have additional cause for lamenting in his case that his splendid dramatic and poetic faculties found no theme more pathetic than the stupidity of *La Clemenza di Tito*, or more noble than the frivolities of *Don Giovanni* and *Figaro*. When Goethe dreamed of a union between music and poetry on a dramatic basis, he gave the idea up in despair over the conventionalities of musical form in the existing operatic stage. Probably the lesser swans of Germany were of his mind, for Weber—whom, by the way, Goethe snubbed shamefully—could find no better help, after the irritable genius quarrelled with him for a share in the popular applause, than crazy old Helmine von Chezy. "These German authors," grumbled Beethoven to Weber, "have no notion how to make an opera book." His own *Fidelio* had passed from its original French into Italian, and out of Italian into German.

The position of Weber as a dramatic composer, and his relations with his "book-makers," give us a clue to the whole unsatisfactory state of the matter before us. Here is a musician essentially dramatic in his bias of thought, able to grasp all the necessities of a sympathetic understanding between audience and stage, alive to the force of emotional effect, open to the power of a consistent spectacle; yet this very man knows so little of dramatic poetry that he scarcely can tell good writing from bad, is incapable of digesting fragmentary material into a consistent whole, cannot estimate the monstrous absurdities of dramatic construction in which the unlucky Von Chezy involves him. Herein lies the rub. It is not only the poet's fault that the operatic stage has proved but a *pons asinorum* between music and the sister art. If the musician calls vainly for a good dramatic "text-book," he must at least know better what he requires before he can expect to get it. The lack of some right standard by which the proper field for musical drama may be

determined must find a remedy in a wider culture of the musician himself which shall enable him to meet the dramatist on his own ground. That notable personage, Herr Wagner, has probably done the cause of musical drama good service in emphatically pointing out this necessity. Herr Wagner's personal recipe—"Every composer his own poet"—can only apply in very exceptional cases. This assumption, moreover, may lead to such astounding struggles with the muse as the libretto of the *Nibelungen Lied*, wherein we behold grotesque Scandinavian myth treated after heroic Greek fashion, and the personages of the child's fairy lore alternating between the naïve conduct of the nursery and the high passion of the dramatic personage of *Æschylus* or *Sophocles*. But, let the eccentricities of the German apostle of a "regenerated and national musical drama" be what they may, he has at any rate demonstrated practically the immense value of an absolute union between the poetic impulse, the musical expression, and the visible appeal of the mimetic art. This unity, by the way, will be sacrificed at the approaching Wagner Festival at the Albert Hall, whereby the advocates of the Wagnerian drama will probably be brought to much undeserved confusion of face.

For want of such a standard of the right subject-matter for musical expression as has been indicated, and in despair at the indifference of poets, we see composers led into the wildest vagaries. Goethe's *Faust* has proved a loadstone mountain for more than one musical shipwreck; and the *Divina Commedia* is not safe from attack. At the present moment we have the supernatural mediæval romances and resuscitated myths of Herr Wagner at one end of the prospect, in the foreground Signor Verdi performing on his Italian tight-rope of passages in the life of Anonyma, or incidents in an Egyptian love story, while Herr Rubinstein in the distance, eager to avenge the cause of the Israelites, is only deterred by his poet Herr Mosenthal from setting all the Books of Moses to music, and barely satisfies his zeal with the history of the Maccabees and the Tower of Babel. From such chaos and unreason of the mind musical we must trust to be delivered by a gradual widening of the basis of musical culture. The musician cannot stand aloof from the progress around him, and if, as we must hope, music is indeed a living art which shall push fresh shoots into the future, our children may live to see a musical drama which will satisfy the ear without offending the intellect.

A VISION OF STEAM TRAMWAYS.

IT has been observed that even people of the most matter-of-fact and business-like character are occasionally subject to an outbreak of poetical and romantic feeling which startles those who are familiar with their ordinary habits. Some such influence seems to have been at work on a Select Committee of the House of Commons which at the beginning of the Session was appointed to "consider how far, and under what regulations, the employment of steam or other mechanical power may be allowed upon tramways and public roads." It was composed of members who, for the most part, are usually sensible and practical enough, such as Mr. Salt, Dr. Lyon Playfair, Mr. Goldney, Mr. Samuelson, Mr. McLagan, Lord Holmesdale, and the like; and they seem to have begun their inquiry in a very rational mood. They state that, "While confining their attention chiefly to the use of mechanical power on tramways, your Committee have endeavoured to give due weight to the interests of all persons concerned. They have mainly considered the safety and the convenience of the public, whether as passengers in the tramway cars or as passers-by along the highways and the streets; but in doing so they have not forgotten to ascertain what may be just to the proprietors of tramways, and have had regard to the position of owners of property and of local authorities." This is, of course, a very fair and proper way of looking at such a question; and as the Committee had to begin with one of its various sides, there is perhaps no reason to complain of their giving the interests of horses the preference. One of the strongest arguments, they say, in favour of the use of mechanical power upon tramways is to be found in the fact that the traction of the ordinary tram-car is a most severe strain upon a horse. The Secretary of the Edinburgh Tramway Company, being asked whether the Company had ever been proceeded against for cruelty to their horses, said, over and over again, "There are very few weeks, certainly not months, in which there are not serious complaints in regard to matters over which we have no control whatever; we get the best horses we can, and provide the best fodder and the best attendance, and yet there is no doubt that on some gradients the horses are very severely tried." The Chairman also said:—"It is very hard work for the horses, and, unless we constantly shifted them from the severer work to the less severe work, they would not last at all." Here the question arises whether this is due to the ordinary working of tramways under proper conditions, or whether it is due to the impracticable nature of the gradients; and any one who knows what they are on such a thoroughfare as Leith Walk will easily understand that they tell very severely on horses which have a heavy tram-car at their back. It would also appear to an ordinary observer that the horses are not particularly sleek and well fed, and that they are very hard-worked. Those who think that tramways ought to be carried everywhere in the interests of commercial speculation may perhaps treat gradients as a mere detail, and would be ready to attempt the ascent even of Arthur's Seat. But common-sense people will probably be disposed to hold that very steep gradients are not exactly suitable for the purposes

of transit, and that a fairly level road ought to be selected. The officials of the London General Omnibus Company also give similar evidence. It is said that horses for this service are usually bought at the age of five years, and the average life of a horse, after that time, is, if drawing an omnibus four and a half years, and if drawing a tram-car four years only; so that tramways are more exhausting to horses than omnibuses.

The Committee think that the evidence tends to show that the use of mechanical power will diminish the cost of traction, but they do not give the data for this opinion. They then proceed to consider the effect of a steam-car upon the ordinary street-car, as to which there is a conflict of evidence. Some witnesses state that horses, even in crowded thoroughfares, are almost wholly indifferent to steam, while others express serious alarm at the prospect of the introduction into the streets of a new motive power. In Paris a steam-car has been running for six or seven months, and, though nobody has yet been killed or maimed, several accidents have occurred, and in one instance an omnibus was overturned. Upon this the Committee remark that "much depends on the nature of the traffic," whilst "a real public advantage may be obtained at little or no risk when the roads are wide and the passing horses are chiefly employed in drawing cabs, omnibuses, or carts"; and that the system of steam-cars is yet in its infancy. This is no doubt partly true; but it may be suggested that it would be prudent to wait till the system has got beyond this crude state before establishing it for regular traffic. It is clear that even in Paris it is not without danger, and in the principal towns of this country streets are not always very wide, nor is the traffic chiefly of a heavy, sleepy kind, but includes light and rapid vehicles and spirited horses.

The appendix to the Report of this Committee is said to contain some interesting information as to Danish tramways, steam-cars in Paris, statistics of accidents in London and Paris, and other matters; but, as this has not yet been published, it is impossible to say how far it is authentic, or what it proves as to the security of passengers through the streets. The Committee have, they tell us, abstained from attempting to decide upon the merits or the demerits of any particular mechanical motive power, whether it be that of steam, air, or springs; but only to ascertain "how far engineers and inventors are able to comply with the regulations that must of necessity be enforced in the interests of the public." Some witnesses have professed their ability to do anything that may be required, while others have been more cautious. The opinion of the Committee is that certain qualifications may be promised, but will with difficulty be obtained; as, for instance, "the precise and accurate action of a speed indicator, of a speed regulator, of a self-acting brake, the emission of no steam whatever, the absence of vapour, smell, or noise." They find consolation, however, in the reflection that to "insist strictly upon all these conditions might lead to results inconvenient both to the promoters and to the public," and that "simplicity in a machine is essential to its efficiency as well as to its safety"; and they therefore come to the conclusion that "some of the regulations proposed by the Board of Trade are not at present desirable, though with most of them we cordially concur." Simplicity of working is all very well in its way; but the question is whether it is right to allow it when it creates a nuisance by "vapour, smell, and noise." The Committee wind up by suggesting the conditions under which they think that the use of mechanical power on tramways should generally be permitted. They are, in substance, as follows:—

- I.—The machinery to be effectually protected and concealed from view.
- II.—The ingress to and the egress from the accommodation in the passenger car to be safe, convenient, clean of the machinery, and free from unpleasant noise, heat, or smell.
- III.—Every engine to be, as far as possible, free from noise of machinery or of blast.
- IV.—The engine to be so constructed and worked as to avoid as far as possible the emission of smoke or noxious or unpleasant vapour.
- V.—Two men to accompany each engine, unless by special dispensation from the Board of Trade.
- VI.—Brake power to be provided sufficient to stop the engine and car in their own length when travelling eight miles an hour.
- VII.—Every engine to carry a fender or some similar protection, and a bell or some sound of warning.
- VIII.—Every engine to carry a number, by which it may be registered at the Board of Trade.
- IX.—Every engine to be inspected twice in each year by a competent engineer, and report to be sent to the Board of Trade.
- X.—Engines not to travel over a public road at a greater speed than at the rate of eight miles an hour in towns, and twelve miles an hour in the country.
- XI.—These regulations to be subject to modification from time to time by the Board of Trade.

Under these circumstances, the Committee recommend that power should be granted to the Board of Trade to license the trial of any particular engine on the tramways to which a Provisional Order or Private Bill refers, for any period not exceeding three months, "anything contained in any Act notwithstanding"; and, further, that, "in order that local authorities or private persons interested in the improvement of mechanical power on tramways may have an opportunity of trying experiments without infringing the law, or incurring the expense of a Provisional Order or an Act of Parliament, the Board of Trade should be authorized to grant permission to try such experiments on any tramway, on the application or with the consent of the local or road authority, for such limited periods and under such regulations as the Board of Trade may impose."

We have quoted very fully from this Report, because it seems to us to be of so extraordinary a character, coming as it does from a Committee composed, it might be supposed, of intelligent and common-sense persons. What it amounts to is simply this, that the

door is to be thrown open for all sorts of wild and dangerous experiments on the chance of their turning out to be not inconsistent with public convenience and safety. It may be admitted that, if the regulations which the Committee suggest were strictly complied with—that is, the machinery to be effectually protected and concealed from view; ingress and egress to be safe and convenient, clear of the machinery, and free from unpleasant heat, smell, or noxious or unpleasant vapours, or noise of machinery or blast; and with brake power sufficient to stop the engine and car in their own length when travelling eight miles an hour—steam-tramways would be less a nuisance than they would otherwise be; but there does not seem to be much chance of the promises of such results being fulfilled. As the evidence on which the Committee have founded their alarming proposal of free-trade in experiments which may be dangerous to life and destructive of public comfort has not yet been published, it is impossible to express any opinion as to how far the machinery actually invented and got into working order complies with these regulations. But the Committee themselves distinctly state that, as far as their inquiries have gone, it will be difficult to comply with the requirements as to the precise and accurate action of speed indicators and regulators, self-acting brakes, the emission of no steam, and the entire absence of unpleasant vapour, smell, or noise. In the course of years perhaps the steam-tramway-car may be brought to perfection: but it is acknowledged that at present it is only in its infancy, and there is no saying what pranks it might play if turned loose in the streets. The railways are specially enclosed lines, with signals, shunting arrangements, and a multitudinous staff of attendants to keep the lines clear; moreover, the traffic is under the control of the managers, and can be foreseen and regulated beforehand. Nevertheless even under all these precautions, how many accidents happen. Yet, in the face of this, it is seriously—but can it be really serious?—proposed that all the thoroughfares of any large and busy town should be invaded by a rush of steam-engines. It must be remembered that tramway lines are not like railway lines—private property—and that if one set of steam-engines is allowed to run, other vehicles of a similar kind will have also a right, in fairness, to go about as they please, just as cabs and omnibuses do. There is also an important point on which, oddly enough, the Committee do not touch; and that is the destruction of roads by tramways, and the ruinous straining and shaking of other vehicles which cross the lines, evils which must almost necessarily be intensified by the use of steam. Then add the smoke, the vapour, and the snorting, screeching noises, and it is easy to imagine what a Pandemonium the streets would be turned into. The fact is that, as it is, the horse tramways are in many cases a great nuisance already, and ought to be more strictly regulated. The steam tramway will be a new terror added to life in large towns.

POPULATION AND WEALTH IN FRANCE.

IT was inevitable that the Franco-German War should arouse attention in France to the stationariness of the population. Whatever differences of opinion may exist on other points, there can be no doubt that, in part at least, the victory of Germany was due to the superior number of men she brought into the field at the beginning of the struggle. This was so clear that, amidst all the disputes waged on other topics, no one has ventured to contest it; and France showed her recognition of the fact by proceeding as soon as she was free to do so to copy the military organization of Prussia. But just when the necessity for enormous armies was demonstrated by a terrible experience, the first Census taken after the war revealed to her that, independently altogether of the loss of Alsace-Lorraine, her population had decreased in six years nearly four hundred thousand. And the more recent Census, though it has shown an increase instead of a decrease, has still proved that increase to be excessively slow. It is hard, as an eminent French writer has remarked, for a people who for twelve centuries have been in the front rank of civilized nations to see themselves sinking gradually to an inferior rank; and naturally, therefore, the information thus brought to light has made a profound and a painful impression upon the public mind in France, and has called forth a multitude of books, pamphlets, and articles of very varying degrees of merit. Among these one of the most original and remarkable has recently been contributed to the *Revue Scientifique* by a well known statistician, M. Bertillon. M. Bertillon begins by stating the facts of his case. At the present time for every thousand inhabitants there are in France between twenty-six and twenty-seven births, whereas in England the ratio is thirty-five, and in Germany from thirty-eight to forty. That is to say, there are twelve or thirteen more births in Germany than in France for every thousand people living; or, to put the matter in a still clearer way, in equal populations there are very nearly three children born in Germany for two in France. This has not always been so. On the contrary, the birth-rate has steadily decreased since the beginning of the century. From thirty-three per thousand, a rate not greatly less than the present English rate, it has fallen by successive steps to 26.3 per thousand. It will be admitted that these facts are sufficiently grave to inspire Frenchmen with anxiety. If matters go on in this way, in another half-century Germany will have nearly sixty-five millions of people, while France will have no more than forty-two millions. If that happens, it will evidently

be in vain for France to pretend to political equality with her rival beyond the Rhine.

And now what is the cause of this slackening of growth of the French population? It is not, as M. Bertillon clearly shows, the scarcity of married women of the child-bearing age. In every thousand inhabitants, in fact, there are in France 140 married women between the ages of fifteen and fifty, while there are only 133 in this country, and no more than 128 in Prussia. Clearly, therefore, the birth-rate ought to be highest in France. A little consideration, however, will show that these figures really only repeat in another form the story we have been telling above. We have shown the small number of births; here we are giving proof of the infecundity of marriages. It is evident that, where families are the smallest, the proportion borne by married women to the whole population will be the highest. Again, it is not to the scarcity of means of subsistence that the slow growth of population is due. Germany is a far poorer country than France, yet the excess of births over deaths is very much greater in Germany than in France. Moreover, as we have just seen, the birth-rate in France itself has actually decreased as the prosperity of the country has increased. Wealth has enormously grown in France during the present century, yet the birth-rate is much lower now than it was seventy-six years ago. This fact seems at first sight to conflict with the commonly received economic theory; but not when the theory is correctly understood. The use of the word "subsistence" is misleading, and ought to be discontinued. Except among barbarous or semi-civilized peoples, it is not the bare necessities of life—the amount of food, clothing, and house accommodation, which, for example, would satisfy a slave—that determine the rate of growth, but the popular standard, for the time being, of what is requisite to make life endurable. If that standard rises faster than wealth grows, the increase of population will be slow; if it rises less rapidly, the increase will be quick. It is hardly necessary to dwell upon this point, for it is a truism to say that when people have once come to regard certain comforts as necessities they will not willingly descend to a more wretched existence. This is the real secret of the stationariness of the French population. M. Bertillon cites many other causes, as, for example, the immigration of Germans, Swiss, and Belgians. But this immigration clearly is possible only because Frenchmen have a higher standard of living than their neighbours. Indirectly, no doubt, immigration checks the growth of population by keeping down wages. But it is itself the effect of the scarcity of French labourers. Partly because of the general diffusion of well-being consequent on the Revolution, the facility with which landed property can be acquired, and the universal desire to obtain it, partly because of the strong hold which the idea of equality has upon Frenchmen, and their unwillingness to see their children descend in the social scale, and partly because of their attachment to their native soil, and the repugnance they feel to emigration, French parents have a high standard of living, and they refuse to risk their own or their children's future by encumbering themselves with large families. Curious and very striking proof of the correctness of this view is afforded by the statistics which M. Bertillon has collected of the influence of peasant proprietorship on the birth-rate. In the thirty departments having the largest numbers of proprietors, he finds that for every thousand inhabitants there are 285 proprietors, 24.7 births, 23.2 deaths, and 25.3 marriages; in thirty-one departments, with a medium number of proprietors, there are 240 proprietors, 25.7 births, 23.1 deaths, and 25.6 marriages; and in twenty-one departments, having the least number of proprietors, there are 177 proprietors, 28.1 births, 23.2 deaths, and 25.9 marriages. It will be here noted how sensibly the ratio of births rises as the ratio of proprietors falls, while the ratio of deaths and marriages varies only by small fractions.

But the really curious and original part of M. Bertillon's paper is that in which he attempts to ascertain the economic results of a slow and a rapid growth of population. Germany, he says, has forty millions of people, and its birth-rate is forty per thousand inhabitants—that is to say, it has 1,600,000 births every year. If Germany had the French birth-rate of twenty-six per thousand, the births would be only 1,040,000. Therefore Germany has an excess of 560,000 births every year over the French proportion; and these, according to the tables of mortality, give 350,000 adults of twenty years of age. Now a man during the earlier years of his life has to be supported at the expense of others—to be fed, clothed, and taught; and these 350,000 young people have to be maintained by their parents—that is, by the generation which precedes them. M. Bertillon estimates that the maintenance of each of them costs four thousand francs, or 160*l.* sterling. Consequently, Germany has to expend 560,000,000*l.* every year on the increase of her population beyond what she would have to lay out were her birth-rate the same as the French. On the other hand, with the German birth-rate, France would have half a million more births than now, and in consequence would have to spend on her children 49,600,000*l.*, which she now saves. Thus M. Bertillon arrives at the conclusion that the greater part of the excess of production over consumption is in Germany devoted to the augmentation of the population, whereas in France it is saved, and goes to swell the disposable capital of the country. In other words, wealth increases largely every year in France, while population remains almost stationary; in Germany, on the other hand, it is population that grows rapidly, and wealth that remains almost stationary. The argument is extremely ingenious, and

beyond all question contains a large ingredient of truth. But it appears to us to have many flaws in it. We are by no means convinced, to begin with, that the growth of wealth in Germany is so slow as is here assumed. Of course, France is out of all comparison the richer country. But that is not the point. The development of German industry and German commerce appears to us the very reverse of slow. In merchant shipping, and especially in steam shipping, the progress of Germany has been far more rapid than that of France. The advance in mining, in the iron and steel trade, in cotton manufacture, has also been very great. Farther, M. Bertillon appears to us greatly to overestimate the cost of bringing up children. It is unquestionable that the modern tendency is to increase that cost. All the necessities of life are dearer than they were, and the prevalence of more humane and enlightened views—the universality of instruction in Germany, for example, and the law restricting the employment of children in manufactories—has the effect of prolonging the unproductive period of childhood. But certainly in no country in the world are young people in general kept idle till they are twenty years of age. The children of the wealthy, no doubt, are; but the children of the lower middle classes begin to work at fifteen or sixteen, and the children of the working classes at twelve or thirteen. At first, we grant, they do not earn their own maintenance, but only contribute towards it. But long before twenty the majority bring in more than they cost. The 160*l.* of M. Bertillon's estimate must, therefore, be greatly reduced. Probably 100*l.* would be nearer the mark. And, if so, the excess in the expenditure of Germany on this item would be 35,000,000*l.* instead of 56,000,000*l.* Again, M. Bertillon assumes that the expenditure on a small family is not proportionately greater than the expenditure on a large family. But surely this assumption is not in accordance with experience. The spoiling of only children has been proverbial in all ages, and, indeed, it is human nature to set a higher value on what is scarce. When parents have but one or two little ones they are more ready to indulge and pamper them than when they have half-a-dozen. It by no means follows, therefore, that the scale of expenditure on the small families in France is no higher proportionately than that on the larger families in Germany. Lastly, M. Bertillon takes no account of the spur applied to the members of large families by the feeling that they have their own way to make in the world. The French peasant is uneducated, unaccustomed to reading, unfamiliar with other countries; he therefore never contemplates the possibility of his son emigrating. Thus Algeria remains unoccupied, and French commerce has few representatives in distant quarters of the globe. The German, on the contrary, knows that the world is wide, and that its good things are to be won by the enterprising and the intelligent. Germans consequently are to be found pushing their way to France, establishing themselves in the counting-houses of London and Lancashire, supplanting Englishmen in China, Japan, and the islands of the Pacific, and helping to build up new States in the Far West of the American Union. This emigration relieves the home-labour market, but it still leaves such an abundance of labour as fully meets the requirements of the country, and stimulates by the keenness of the competition the dexterity and the inventive faculty of the people. Although, then, there is much truth in M. Bertillon's theory, it must not be pushed too far. The cost of a rapidly increasing population is much less than he represents it, and it is partly recouped by the greater productive power of the larger population. There can of course be no question that at certain times and in some countries population has grown too rapidly. It did so notoriously in Ireland during the sixty or seventy years that preceded the potato famine. Apparently it is doing so at the present time in India, where the introduction of English capital alone prevents universal pauperism. And it seems long since to have done so in China. But we see no proof that in Germany the expenditure on large families is seriously encroaching on the saving powers of parents, or that in France thrift would sensibly suffer if the birth-rate were considerably increased. M. Bertillon does not sufficiently allow for the fact that in countries which have once accumulated large capitals the growth of labour is as necessary as the growth of capital. In France, for example, the stationariness of the native population does not cause a very great rise of wages; it simply stimulates a German, Swiss, and Belgian immigration.

THE THEATRES.

FROM a production called "*The Firefly*, Evening Paper and Programme," which is sold in the Criterion Theatre, and would have some distant affinity to the *Extra* or *Orchestre* of Paris but that it contains advertisements of only two out of the many London theatres, we learn strange things concerning Mr. Albery's adaptation of *Les Dominos Roses*. It is, according to this authority, "the best farcical comedy that has been produced in London within the recollection of the present generation of playgoers." The ingenious writer of the notice goes on to say that the construction of the piece, which he does not observe is the work of MM. Delacour and Hennequin, is a "marvel of ingenuity," while the brilliant dialogue "reflects the highest credit on the adapter, Mr. James Albery. . . . The comedy is wholly free from any immoral or improper construction, save by those whose imagination has been allowed to run riot. . . . Some of the press have made most uncalled-for attacks upon the *Pink Dominos*, but, as a matter of fact there is not a line or a situation

in the piece that the most fastidious can take an exception to." People who have expressed any disapproval of the morality of the piece must, we are told, have been full of memories of the original *Dominos Roses*, and have thus "visited the sins of the author upon the adapter," and been "guilty of a serious injustice to the management of the Criterion Theatre," and a reflection upon the highly respectable audiences who pay their money to witness and enjoy the performance." All this is mighty fine, and reminds one pleasantly of a certain scene in the *Legend of Montrose*, where the supposed Murdoch, visiting Dalgetty in his dungeon, answers his questions about the Marquis of Argyle in a manner which leads Dalgetty to exclaim, "I never heard so much good of him before; you must know the Marquis well, or rather you must be the Marquis himself!"

To the brilliant piece of writing quoted above is appended a letter written by Mr. Albery to the *Daily Telegraph*, in which he says:—"The licenser has the power to strike out any passage from a play. I wish he had the power to strike out from the audience those few obscene purists who set silly folk looking for innuendoes that the author never intended." This is ungrateful of Mr. Albery; the mistaken people for whom he has found so graceful and appropriate a name have been the means of exciting curiosity concerning the *Pink Dominos*, and securing for it an amount of attention which "the author," as Mr. Albery chooses to call himself, might otherwise have failed to catch. That attention should be so directed to a play is not very creditable to the audiences who go to see it; but it is comforting to reflect that those who are attracted to the *Pink Dominos* by the hope of seeing or hearing something dreadfully improper are likely to be rather disappointed. It is no doubt possible to put an unpleasantly suggestive meaning upon some passages in the play; but a sufficient exercise of ingenuity might avail to do this in the case of many plays of higher calibre than the *Pink Dominos*. The moral tone of the piece is no better than that of certain other more pretentious plays taken from the French, as an instance of which *Peril* may be named; but the representation of society given in a wild farce is hardly to be taken seriously, while in what is now termed comedy-drama the events and motives put before the audience must be supposed to have some foundation of fact. The moral theory indicated by a wife who lives contentedly with her husband, and says to a woman younger in experience of married life than herself, "A good husband is one who is gentleman enough to be a hypocrite," is distasteful enough no doubt; but neither Mr. Albery nor MM. Delacour and Hennequin are authors of such weight that even the most foolish audiences are likely to incur any moral danger from listening to their cynical frivolities. We have no wish to suggest that the tone of the *Pink Dominos* is desirable, or that plays of its class can ever be acceptable to people who have any true care for the interests of the stage. But the outcry which has been raised against it as a detestably immoral production seems to be unwarranted. The general morality of the characters in the play is at least as high as it is in the *School for Scandal*; but possibly people who are not shocked by the representation of the wickedness of a bygone time may feel their moral sense outraged when it is suggested that men of the present day are not insensible to the charms of bachelor suppers, and will tell their wives lying excuses in order to enjoy them. For the rest, Mr. Albery, who once gave promise of originality and dexterity as a playwright, has paid himself no compliment in giving in to the current fashion of borrowing from the French; and, if he was determined to borrow, he might have found some better employment for his skill as a translator than reducing to a propriety which some people have questioned a piece which is as completely French in its low aim as in its neatly interwoven construction. The English writer in his dialogue attains some smartness by making people talk to each other as they can only talk in the regions of farce; and he has made one gross blunder by retaining a character which, when its original nature is taken away—a thing which on the English stage is fortunately necessary—becomes utterly incomprehensible and foolish. The actors concerned in the *Pink Dominos* have no very difficult task to perform, and perform it tolerably well. Mr. Wyndham in one of the principal characters displays the boisterousness which with many people passes for humour; while the undoubted talents of Miss Fanny Josephs and the very promising performance of Miss Eastlake seem thrown away upon what they have to do. The acting by Mr. Ashley of an innocent old gentleman who is constantly longing to burst into juvenile extravagance is admirably comic.

Le Village is not one of M. Octave Feuillet's happiest dramatic productions, and its adaptation for the Prince of Wales's under the name of *The Vicarage*, by Mr. Saville Rowe, is about as dull and deplorable a piece of work as can be imagined. The outline of the piece is that an old couple who have lived long together in a retired country vicarage, happy in a circle of narrow interests, are visited by an old friend who is a great traveller, and by his talk excites the Rev. Noel Haygarth into the intention of spending with him three or four weeks on the Continent. From the storm which the expression of this intention raises one is led to suspect that Mrs. Haygarth has private information of some deep and dark design which is hid beneath the seemingly innocent project of the vicar and his friend. With trembling voice and tearful eyes she says that she only lives to make her husband happy, and, if it will make him happy to take this holiday, why, let him go. At the same time it is to be observed that she uses every effort to detain him, and finally succeeds in persuading both him and his friend George Clarke that to vegetate in the vicarage is much better than to roam about the world. The motif

of the piece is one that could only be managed successfully with the lightest and most dexterous touch, and Mr. Saville Rowe's hand is far too heavy for the task. Nothing, for instance, short of Mrs. Bancroft's skill could prevent an utterly ludicrous impression being produced by Mrs. Haygarth begging her husband with pathetic appeal to let her look over his things for him, as then he may perhaps think sometimes of her when he is far away, within two days and a half of London. There are certain peculiarities about the state of manners represented in *The Vicarage* which are in their way no less striking than those exhibited in Mr. Albery's version of a French play. The experienced and presumably cultivated traveller "George Clarke C.B." opens a lively and amiable conversation with his host and hostess by complaining of the spongy toast and stewy tea which they set before him, and ringing the bell for some lemon to put in his teacup. He explains this demand by saying that in Russia people never dream of putting milk into tea, and that the lemon which they substitute is infinitely better. The furniture of the very quiet and old-fashioned vicarage in which this terrible drama is enacted is not its least remarkable point; the house is decorated after the newest æsthetic fashion, which no doubt gives point to the pathetic remark of Mrs. Haygarth that "there is not a thing in this house which is not a landmark in our lives." The acting of *The Vicarage* by Mrs. Bancroft, Mr. Arthur Cecil, and Mr. Kendal is excellently careful and finished, but cannot make the piece seem anything else than a solemn and doleful absurdity. It serves a purpose in making the empty froth and incongruous nonsense of *London Assurance*, which follows it, seem at first at least gay and natural by comparison. But *London Assurance* is in truth a piece which fully deserved the bitter caricature of it sketched by Thackeray in "A Night's Pleasure," and is utterly unworthy of the good acting devoted to it at the Prince of Wales's. In some respects, indeed, the acting is too good; the play is so completely and hopelessly artificial that the naturalness skilfully imparted to almost all the characters breaks rather than helps the illusion; it is as though the scenes of a pantomime should be gone through with the utmost gravity and decorum by a well-trained comedy troop. That Mr. Kendal should be good as Charles Courtly is perhaps less surprising than the excellence of Mr. Bancroft in Dazzle, a part which one would not have thought was much in his line. Mr. Tresdale and Mr. Kemble are, if anything, too quiet in Squire Markway and Dolly Spanker; but that is a fault on the right side. Mr. Arthur Cecil needlessly exaggerates the unnatural part of Sir Harcourt Courtly until the last act, throughout which his playing is extremely skilful and delicate. Mr. Sugden as Cool, the impossible valet, is as good as possible. So much praise cannot be given to Mr. Honey's Mark Meddle; but Mr. Honey has to deal with a character in which there is really no humour, and in playing which actors generally resort to certain stage tricks which Mr. Honey, much to his credit, avoids. Mrs. Kendal's Lady Gay Spanker is one of the best performances which this clever actress has given us, and in it she displays a vivacity and brightness which in some other parts she has shown too little. Mrs. Bancroft sets an excellent example by giving a charm to the small part of Pert. The play is much overloaded with elaborate scenery, which is perhaps the reason why the intervals between the acts are far too long.

The revival of *A New Way to Pay Old Debts* at the St. James's shows how much the art of dramatic construction and characterization has improved since Massinger's time. One hardly realizes, in merely reading the play, how weak for stage purposes it is until the last scene is reached. The character of Sir Giles Overreach is no doubt what has kept the play on the stage by dint of the opportunities it gives to an actor powerful to express the extravagance of passion. This is hardly what Mr. Hermann Vezin excels in; everything he does is artistic and scholarly, and these very qualities interfere somewhat with his successfully rendering a part for which is needed a brutality which Mr. Vezin seems unable to assume. His Sir Giles is in all the earlier acts too much of a gentleman; his fawning upon Lord Lovell, contrasted with his harsh speeches aside to his daughter, is from one point of view admirably conceived and executed, but it is the fawning of a polished courtier, not of the cunning and ferocious Sir Giles. In the last scene, however, Mr. Vezin displays a great intensity of passion, which is marred only by an indistinctness of utterance, which is a new and unwelcome fault in the actor, whose articulation has generally been excellent. Mr. Flockton, as Marrall, gives a fresh proof that he is an actor of singularly versatile power who can think out a part and give successful expression to his thought. Mr. Clayton gives a pleasant and well-marked rendering of Well-born. Before this play is performed a comedietta, by Miss Kate Field, called *Extremes Meet*, in which Miss Field herself plays the principal part, and shows that in a less feeble and ill-written piece she might possibly be an actress of value.

REVIEWS.

THE SICILIAN ANARCHY.*

THE complaints of personal outrage suffered by English residents in Sicily, and the consequent debates in the Italian

* *La Sicilia nel 1876. Libro Primo: Condizioni Politiche e Amministrative, per Leopoldo Franchetti. Libro secondo: I Contadini in Sicilia, per Sidney Sonnino.* Firenze: Barbera. 1877.

Parliament, have gained a wide hearing for this full exposition of a very painful topic. Those among the early friends of Italian independence who were never carried away by enthusiasm for the transcendental heroics of Mazzini and Garibaldi have not been surprised at the failure of the new government in the southern provinces. It is notorious that Cavour and his Piedmontese colleagues in 1861, while forced to accept the conquest of "the Two Sicilies" in the year before, as well as to compass that of the Roman Marches and Umbria for the security of Victor Emmanuel's kingdom, did not look hopefully on this extension of their administrative task. Upper Italy, comprising Lombardy, with Parma and Modena, the Legations of Ferrara and Bologna, commonly called the Romagna, and the late Grand Duchy of Tuscany, was to have been the chosen field of constructive and regenerative statesmanship. Its ablest and most influential men, such as Minghetti and Ricasoli, were already prepared to continue the work of Cavour, with the active support, at least in every town of Lombardy and the Romagna, and likewise in Florence, of many respectable citizens, and of some of the rural nobility or gentry. The social condition of these northern provinces, with a thriving middle class of small proprietors or farmers on the metayer system, and with their accustomed docility to the guidance of superiors in rank and education, was favourable to their harmonious political settlement. Their population was thoroughly imbued with the traditional urbanity of old Italian manners, and with respect for legal and official authorities. But in the Two Sicilies, as the joint continental and insular dominions which Garibaldi wrested from the Bourbon dynasty of Naples had been previously styled, there was a totally different state of affairs. It was not without great reluctance, and only to prevent a wild democratic and republican triumph inviting a French intervention, that Cavour agreed to the incorporation of the Neapolitans and Sicilians with the naturally loyal subjects of the new Italian kingdom.

The process of political digestion and assimilation in this case, but especially with regard to the island of Sicily, has, in fact, proved desperately hard. These two volumes, by Signors Franchetti and Sonnino, on the social and administrative condition of Sicily, present a deplorable picture. After fifteen years of connexion with the Italian constitutional monarchy, that unhappy portion of the national territory, inhabited by a singular mixture of races owing to the alternation of conquests in the middle ages, is a prey to lawless violence which its rulers are confessedly impotent to restrain. The testimony of Signor Franchetti, whose comprehensive analytical study of the workings of the civil administration fills one volume, is an unqualified condemnation, not of any particular political party, nor of the policy of annexing Sicily, but of the attempt to give it equal self-government with the mainland of Italy. Its lamentable unfitness at present for the salutary exercise of local public authority by any class of its own citizens is here exposed to view in no unfriendly spirit. Signor Franchetti does not shrink from declaring that, "in order to save Sicily, the State must govern it without the co-operation of the Sicilians." Yet he repudiates the notion that they are by nature incapable of self-government, or debared by some mysterious fatality from partaking, in due course, of European civilization. Their social and moral progress has been obstructed primarily, it appears, by pernicious economic causes which have prevented the growth of the habits and opinions essential to a law-abiding people. We have in our own history witnessed a similar kind of hitch, so to speak, in the process of bringing Scotland and Ireland, after their respective unions with England, up to the ordinary and indispensable social requirements of peaceful British citizenship. Patient and tolerant consideration of the morbid state of a foreign community under these circumstances, with a candid recognition of the difficulties in its government, is claimed more especially from our own countrymen. To judge fairly of the merits of a new rule in the southern provinces, highlands, and islands of Italy, we should compare its results with those shown in North Britain under the early Hanoverian reigns, or in Ireland not a hundred years ago.

This preface should rather serve to mitigate the shock with which a stranger in Sicily, after his first brief enjoyment of the delicious aspect of Palermo, enters a country that is delivered up to murder and rapine. He is daily alarmed or grieved by fresh tales of what, in any other part of Europe, would be called the most barbarous and savage crimes, but at which the natives are not at all scandalized. It seems little, as in Ireland, to those who are accustomed to hear of it, that a landowner has been shot dead from behind a wall, simply for having let his field or garden, or given employment on his estate, to a person forbidden him by the local gang of "prepotenti," or usurpers of power in everybody's private affairs. There are many precedents also in other lands of extensive upland pasture for "the good old rule, the simple plan," exemplified in Rob Roy's cattle-stealing depredations; and the configuration of Sicilian mountains and valleys is suitable for that pursuit. The stolen flocks and herds taken from the northern districts of the island are sequestered in some recess of the interior highlands, till they can be driven quietly down to the south coast, and there shipped off for sale at Tunis. The brigands of Greece, too, and of the Southern Apennines, have brought to equal perfection the system of kidnapping rich proprietors and extorting large ransoms from their distressed families or friends. But in the complex organization of crime in Sicily there are peculiar methods, attesting the connivance at least, if not the active complicity, of members of the respectable classes. A recognized dictatorial terrorism, exercised by the "capo-

mafia," or elective chieftain of a band of homicides, robbers, and wasters of property, is allowed to interfere in all manner of legitimate business. The hire of workmen and servants, the terms of a lease or sale, the biddings at a public auction, are controlled by this notorious conspiracy against the law of the realm and individual freedom of action. Its influence is frequently lent, for a consideration, to serve the purposes of influential men holding good positions in society. Municipal offices, the administration of charitable trust funds, of the "opere pie," and the like, are disposed of in subjection to the dread of confederate vengeance for any opposition to the local tyrants. It may seem incredible that an opulent and ancient aristocracy should endure such ignominious dependence on the vilest rabble. The motive, however, is not cowardice, but an hereditary inclination to use the services of these venal banditti—as the ancestor of a Sicilian noble used to employ mercenary troops or "bravi"—in their own private quarrels. In Sicily, as in other Mediterranean islands where the prevailing social morality has a wild Saracenic or North African flavour, the "vendetta" is worshipped more devoutly than the Madonna and the Saints. One standing feud between two rival houses or clans is computed to have cost thirty-five men's lives within a twelvemonth. In the streets of Palermo, as in some towns of the Southern and Western States of America, four or five gentlemen on each side will exchange shots from their revolvers, as the Montagues and Capulets of Verona exchanged the rapier cuts and thrusts of that romantic age.

All this is pretty much what might be expected in a detached fragment of Southern Europe which has remained, in spite of revolutions and constitutions, little affected by modern reform, except in the mere outer framework of government. The authority of the State has never yet been regarded there with attachment, confidence, or respect. It was so much abused by the late Bourbon dynasty as to implant a sentiment of profound detestation in the popular mind. The Italian national monarchy has not yet found the way to conciliate affection or to command obedience among its new imperial subjects. There is no middle class whose industrial and trading interests might be consulted by the establishment of an orderly civil rule, assimilating their province to the rest of Italy. The representatives of the old Barons, whose feudal prerogatives were suddenly abolished in 1812, having recovered their power, without legal sanctions, through the corruption and feebleness of the royal Government, have since then contrived to keep it by the criminality of the lower class.

This is a frightful indictment against a whole people; but it is the net result of Signor Franchetti's statements with regard to the social condition of Sicily down to the period of his commission of inquiry last year. His two colleagues, Signors Sonnino and Enea Cavalieri, were occupied more especially with researches as to the material resources and agricultural economy of the island. Sonnino's treatise on the state of the rural population, the industries and products of different districts, the customs of land tenure, rent and wages, and their effects on the life of the peasantry, contains a store of detailed information mixed up with theories of agrarian policy having but an indirect bearing on the subject under our notice. Cavalieri's portion of the joint work has not been completed in a proper form for publication, but the materials here collected are sufficient for certain general conclusions. Many particulars are confirmed by the report, published last September, but dated in July, of a Parliamentary commission of inquiry upon the condition of Sicily, which has been cited in recent debates. We refrain from attempting to decide any question suggested by these Italian publicists with reference to the land laws, the remuneration of labour, and other economic causes of an unsettled social state. Signor Franchetti's volume alone supplies abundance of proof of the most serious allegations of failure on the part of the Italian Government. It cannot be worse, indeed, than that of the Bourbons before 1860; but it does not appear in Sicily to be any better. Its vices, of course, are not inherent in the monarchy or the central authority, but are of local origin; nevertheless they are an intolerable disgrace and mischief to the whole of Italy, and it would be treason to Italian patriotism were any party to attempt their palliation.

The Italian Government, in one word, finds itself isolated amidst Sicilian society; and this, not because it is Italian and represents the national unity, but only because it is a regular government, with some pretensions to enforce public order and law. It finds itself, says Signor Franchetti, "encamped in Sicily" as in a land and people utterly hostile to its administrative aims and views. That province would seem to be a piece of the world of the turbulent middle ages, which had never dreamt of the modern Code and police. Most Sicilians of the upper class, we are told, cannot as yet form an idea of the public welfare, in the abstract, but only of personal or private interests. They regard the force of a Government as the mere ally of one set of persons against another. Whenever it would take an independent and impartial course it becomes the object of general aversion. Its procedure is thwarted by a tacit universal conspiracy of reluctance, concealment, and deception. It is deprived of those various local agencies which are the hands, the eyes, and ears of a ruling civil power. To carry on the figure, our author says that "the public authority, blindfold and deafened, is still groping about in search of the assassins and other malefactors who are known to everybody else." The characters and habitual misdeeds of such persons may indeed be known to the superior administrative officials as well as to the judges and public prosecutors in the criminal courts. But to set in motion the

machinery of police arrests and judicial procedure requires information, repeated formal depositions, the examination of witnesses successively by an officer of public safety, an inspector, the judge of instruction, who must commit the prisoner for trial, and finally by the judges in the assize courts; in some cases also the verdict of a jury is needed. The impudent and crafty mendacity of a people whose glory and delight is to baffle the law contrives to fritter away the substantial evidence of crime before any definitive sentence can be pronounced. When the accused, as commonly happens, is under the protection of the "Mafia," nobody will dare to appear twice against him with a plain statement of fact; but every witness will equivocate, retract, alter, and confuse the previous evidence, so that the magistrate has no choice but to discharge the prisoner. The inferior servants of the police establishment, of the prisons, and of the magistracy are mostly in league with the enemies of the law. It often happens that arrests which were to have been secretly prepared and suddenly effected are prevented by notice being given beforehand to the culprit, who has ample leisure to change his residence after this timely warning from his friends in the police. We are told how the popular brigand chief of a mountain district, knowing that a warrant is out against him, boldly comes to town and reveals a few days at his favourite tavern, while the carabinieri, guided by his trusty accomplice, perform long marches around his highland home. This attitude of cool defiance and conscious security in the habitual perpetration of violent and lawless acts seems to be greatly adumored by popular opinion. The lives of celebrated banditti have a romantic charm for Sicilian youth, some of whom, the sons of good families, have joined the brigands, it is said, from pure love of adventure.

How to set this Sicilian anarchy to rights is a problem which must be left for the Italian Legislature to solve. The case is beyond the reach of the ablest Executive with the existing laws and institutions. Fifteen or sixteen prefects have succeeded one another at Palermo in as many years. Some have tried and done their best; yet all have failed to enforce the law, to break the lawless power of criminal combinations, to protect the honest and innocent citizen, if such there be in Sicily, from personal outrage and oppression. An almost ludicrous description is given of the perplexing situation of a zealous functionary newly arrived in the island, perhaps coming from loyal and orderly Piedmont. He is received by the wily Sicilians with the most flattering courtesies. He had expected to find their community a sort of Inferno, where so many of his predecessors had gone through a brief term of shameful torment, and retired amidst the mocking derision of their triumphant foes. Instead of this, he is invited to join a happy family of unsophisticated natives, who almost persuade him that their local relations are a pattern of harmony. It is not long, however, before he hears complaints of the state of the roads, the frequency of robberies and murders, and above all the weight of taxation, and when he begins to look into the details of administration, he finds that beneath a perfect regularity of external forms, they are entangled in a vast web of mystification to which no clue is readily obtained. If he applies to persons of reputed character and local experience, they give him the most different counsels, each faction or clique prescribing an exclusive attention to its own interests, and telling him to be wary of the others. He resolves to be impartial, to strike out an independent course of energetic action; then there rises round about him the hydra-headed monster of popular calumny, and its hundred mouths assail his character with a pelting storm of unjust accusations. The whole provincial society declares war against the agent of the royal Government, and attacks him with implacable fury; it prompts the Sicilian deputies and senators at Rome to urge the case in the Italian Parliament against the Ministry of the day. The end is that the unhappy prefect or sub-prefect is either removed from his post, or surrenders his pretensions to strict official integrity, and becomes the tool of some local faction, compromising his own authority by illegal and violent measures. The same demoralizing influence besets the minor agents of the State in the fiscal and the judicial branches of administration. These officials, but especially the "pretori," who are charged with the supervision of a multitude of suspected persons, as well as with the detection of crimes and the identification of criminals, are seldom trustworthy; and such is the difficulty of proceeding by regular course of law to the apprehension and conviction of notorious offenders, that the earnest or exasperated magistrate is often tempted to make an excessive use of arbitrary and extra-legal powers which should be reserved for an exceptional crisis. It is confessed that there has been frequent abuse of the preventive methods of dealing with persons put under the ban of police admonition, and those who are sometimes compelled by Government order to reside in a specified place. The total number of "ammonti" in the three judiciary districts of Palermo, Messina, and Catania was in 1874 about three thousand, and nearly a thousand persons were placed under restraint in the matter of their domicile. But these were mostly petty delinquents, guilty of some larceny or theft in fields and gardens, not the bold brigands who attack houses and villages in broad daylight, or who rob travellers and mails on the King's highway. To catch any of these really formidable public enemies is a feat rarely accomplished; and it can only be done by resorting to devices little befitting the agents of the law. Instances could be mentioned, says our author, in which a leader of bandits has been destroyed by a process more like an assassination than an execution. The Italian soldiery, and the "carabinieri" or

gendarmes, seem to be all the instruments upon whose obedience the State can rely in that unhappy island, since the mounted patrol of the country, the "militia a cavallo," are usually in league with the brigands. Altogether this is a hideous picture of anarchy in a province of that new kingdom in whose freedom we have rejoiced. The malady has been laid bare to view, and its seat has been probed by Signor Franchetti with an unsparing hand. But to prescribe and effect the cure is a task of more consummate surgery than has yet been shown by the surviving Italian statesmen of the national revolution.

SHUTE'S DISCOURSE ON TRUTH.*

THE valiant endeavours of Mr. Green and Mr. Grose to call back the youth of Oxford from wasting their time on a barren insular philosophy to learn from Hegel how self-consciousness constitutes reality seem to be thus far not wholly successful. The fascinating bane of Hume has, in at least one instance, been too much for the antidote of Mr. Green's most ingenious Introduction; and we see here the work of an unruly spirit which has not only drunk deep of Hume, but insists on carrying out Hume's inquiries to lengths even beyond Hume's results, unmoved by the charming of Mr. Green and his colleagues. Mr. Shute has answered the call of the Hegelians by following with absolute devotion—not the slavish copying of the letter, but the true service of a kindred mind—in the footsteps of Locke and Hume. Quite in their spirit, and not without a certain fresh quaintness of manner that reminds one of their language, he has taken up fundamental questions from the beginning, and worked them out with as little reference as possible to the accepted notions of the schools; and he has performed his task not only with an acuteness which makes his work brilliant as an exercise of dialectics, but with a thoroughness and solidity which make it a really formidable addition to the armoury of empirical philosophy.

The first chapter is concerned with the definition of truth, and this, we confess, is the chapter we care least for. *Truth* is a word of extensive use, and in no way peculiar to philosophy, and we do not see that philosophers are bound to compete with philologists and dictionary-writers in defining it. Mr. Shute's own definition, when he arrives at it, is after all a vague one, and also does some violence to the common usage of the word. Nor do we see that it afterwards comes into play to any important extent. The topic next taken up is that of definition. This soon leads us to the consideration of class-names, and the reader is plunged unawares—for Mr. Shute makes a point of speaking throughout as one not addressing experts—into the venerable controversy about Universals. Mr. Shute, as an Englishman and the disciple of Englishmen, is an uncompromising Nominalist, and holds that the so-called universal is only a cluster of more or less confused remembrances of particulars. This he expresses by the following happy illustration:—

A general idea is like a wide-stretching landscape, whereof portions stand out clear in the sunlight, while the remoter regions fade away in the distance. What, then, are the clearly marked, and what the misty and doubtful features of this complex whole? The fixed and vivid portion will consist of those qualities which have been common to all our experiences of the individual members of the class. The vague and shadowy background will consist of qualities which have varied in different members of the class with whom we have met. Other things being equal, each individual experience will count as a single unit towards the forming of the general idea. The chief exceptions to this rule are that instances nearer in time will have more effect than those more remote, and that those in which we have taken an interest, or in which our attention has been excited by the conjunction of our experience with some violent emotion, whether pleasurable or painful, will counterbalance a very large number of mere ordinary neutralized experiences.

So far he is with one set of logicians against another. When he comes to discuss the nature of propositions, Mr. Shute breaks loose from the logicians altogether. He takes the line of denying that there is any real universal knowledge; a proceeding which may surprise many, though it does not surprise us, who have already found no difficulty in conceding to Mr. Green that this is the only tenable position for a consistently empirical thinker. But, more than this, Mr. Shute carries the war into the enemy's country by denying that there are even any real universal propositions, which he makes out as follows:—In the statement "All A is B" the form only is universal, the term "all" being really doubtful. Putting aside the disputed cases of so-called necessary truths, we constantly make statements in the universal form about things of which we cannot have universal knowledge, so-called contingent truths of which we can speak only from limited experience. In such statements the real significance of "all" is not positive but negative; it is a compendious sign of uncontradicted experience. "All A is B" means that many A's have been found to be B's, and that no A has been found to be not B. The value of the statement as a guide to conduct obviously depends on the nature of the case, and the extent, character, and circumstances of the experience. The proposition tells us vaguely that the evidence known to the speaker, or to those from whom his information is derived, gives a result of a certain kind. The specific worth of the result can be arrived at only by examining the evidence. Treating in like manner the "particular" form of proposition, Mr. Shute finds that in "some A is B," the word "some" is the symbol of con-

tradicted experience. It tells us that there have occurred cases in which A's were B, and cases in which other A's were not B; as to the proportion of the two classes of cases it tells us nothing. By this line of consideration the reader is led to what is really the fundamental idea of the chapter, if not of the book—namely, that such an expression as "absolute certainty" is absolutely unmeaning.

This may seem sufficiently daring; but the chapter "On Cause and the Law of Universal Causation" goes, if possible, further. Mr. Shute maintains without reserve that the relation of cause and effect is something purely subjective. "The connexion between the phenomena is the work of the mind and the mind only. A cause is merely that which the mind selects as a sign of the coming of that other phenomenon which it calls an effect. An effect is merely that which the mind chooses as a sign of the past existence of a cause." As regards the current notion of cause and effect as antecedent and consequent this seems to us perfectly right. We could wish that Mr. Shute had found room to consider Mr. G. H. Lewes's proposal to give a new scientific meaning to cause and effect by considering them, not as antecedent and consequent at all, but as a twofold aspect of the same thing; this, however, would not be strictly relevant to his purpose, which is to deal with the conception as it is found in common use. He goes on to say that the relation of cause and effect is very similar in character to that of thing and attribute, and to some extent interchangeable with it. The difference is a difference established in thought by ourselves and for our convenience, and is this; an *effect* may be thought of as persisting after the *cause* is gone, while an *attribute* cannot be thought of as persisting after the *thing* is gone. All this must be an abomination to transcendentalists; but what follows will be hardly less displeasing to many followers of the English "inductive" school. Mr. Shute treats the canons of induction, and the law of the uniformity of nature, on which all the canons of induction are said to rest, with very moderate respect. He says, and rightly says, that the canons of induction are at best approximate in practice, because we can never observe all the phenomena. This is true; but we should add that a vast number of them are irrelevant, and the art of skilled observation—which is a thing quite beside the formulae of inductive logic—consists in selecting those which are relevant ones in a given subject-matter and for a given purpose. As for the uniformity of nature, Mr. Shute boldly says it "is only not untrue because it is absolutely unmeaning." Here we think he has been tempted into a paradox. In so far as he holds with Professor Bain against Mr. G. H. Lewes and others (we doubt, though Mr. Shute apparently does not, whether it is really against J. S. Mill) that the uniformity of nature is not capable of logical proof, we are at one with him. But the uniformity of nature is nevertheless quite intelligible as a practical assumption. It is in one sense unmeaning to say that the same conditions always give the same results, because the conditions are, in truth, never exactly the same. But it is not unmeaning to say that like results always give like conditions; that, so far as the conditions in any two cases are similar, just so far will the results be similar. This is an assumption which everybody makes in a rough way for his own dealings with the external world. The assumption has to receive a wider and wider extension in proportion to the increase of knowledge; and when we come to see that we must extend it without limit, we express it in a general form, and call it the law of uniformity. It is quite true that we have no logical "right to assert," "that such a uniformity will always continue, or that it will continue beyond to-day." We make the assertion because we cannot get on without it, and Nature, being in fact uniform, is justified of her children. At all events, we know not by what right Mr. Shute asserts, in any sense relevant to this question, that at certain times Nature "takes great leaps." He goes on to say (in effect) that the supposed axiom, "The Future resembles the Past," is only a statement in objective terms of the subjective fact that our expectations at any time are framed on our experience down to that time. To this we have no objection, and we could almost take for granted the ingenious discussion with which he fortifies this position, and in which he maintains that the idea of a future event is nothing else than the conjunction of certain ideas already given in experience with a confused notion of duration; whereas in the idea of a past event there is a distinct notion of duration, and in a general proposition duration is eliminated altogether.

Mr. Shute next treats separately of the manner in which we come to form the conception of cause and effect. He criticizes Hume's reduction of the process to mere habit, and, having found it unsatisfactory, adopts the *animistic* theory, which Hume, not having before him what we now know about primitive beliefs, did not sufficiently consider. The modern philosopher's law of causation is a legacy from the mysterious, capricious, and spirit-haunted universe of the savage:—

When this belief in the existence of spirits in each individual thing was universal, every change was definitely and directly attributed to the action of some will or spirit, either within the thing changed, or external to it. Now man being only directly conscious of the action of his own will over his limbs, and knowing that in every case of such action there intervened between the will and the motion a causation of effort, naturally assumed an exact similarity in the mode of action of the "spirits" of other things, which were in fact mere reflected images of his own, and thus blended the notion of conscious effort with those of will and change to form his whole complex notion of cause, that is (as he represented it to himself) of the action of Spirit in the Universe productive of Change.

These beliefs are, dead or dying, but the habits of thought and

* *A Discourse on Truth.* By Richard Shute, M.A., Senior Student and Tutor of Christ Church, Oxford. London: Henry S. King & Co. 1877.

language engendered by them survive. "Our whole notion of Causation is now one vast metaphor."

An extremely ingenious chapter deals with the principles of induction. The argument will hardly bear condensing, but one of the leading ideas is that what we call the discovery of remoter causes by induction is really a process by which we assign some certain thing as a link to bind together in thought several different things that are causes (in the popular sense) of the same phenomenon. The thing so assigned is then called (in an artificial sense) the cause of the phenomenon from which we started. The practical warrant for the general assumption of uniformity (which we missed in the foregoing chapter) comes in here as a passing remark, and the conclusion is, as any one who has followed Mr. Shute so far will now expect, that induction cannot give absolutely certain knowledge. Deduction, on the other hand, and even the much-vexed syllogism, are rather handsomely treated; J. S. Mill's doctrine that a syllogism contains no real inference is disputed, and it is maintained that, although deduction in the syllogistic form can seldom, if ever, increase our general stock of knowledge, it may often practically increase the knowledge of the person who uses it. It is all very well to say that the conclusion is "potentially" in the major premiss, but "potential knowledge is actual ignorance." As to the universal form of the major premiss, it no doubt involves—not, as some say, the actual conclusion, but—"the intention of expecting like results in similar cases." This is the really universal element which the mind adds to particulars to make inference possible. And, as a matter of fact, we do reason through universals, being unable to remember the multitude of particulars.

Under the head of "the Matter of Thought" we find an essay on the process of thinking in articulate words, which is remarkable both for its reasoning and for its imagination. It is an obvious fact that a waking man—a civilized man at least—is almost always thinking more or less, and with rare exceptions, thinking in words. Philosophers have said that thinking and reasoning in words is dangerous, and that we ought to think in the mental images represented by the words. Mr. Shute maintains, on the contrary, that "this substitution of ideas of words for other mental images as the material of thought is part of the great process of the advance of civilization and the fitting of man for his circumstances." The argument is, in brief, that the gain in speed far outweighs the loss in certainty. We conduct reasoning with words as we conduct an algebraical calculation with symbols, and do not stop to translate the symbols until we have worked out the result. This imposes on us a duty of care in choosing and handling our symbols which is unknown to people in a ruder state, who work, as one may say, with palpable ideas. But this is simply the law of all civilized life. All complex instruments have their dangers. A counterfeit sovereign may be put off on us, but hardly a counterfeit ox; yet nobody doubts that coins are better on the whole than cattle as a medium of exchange. Or, as Mr. Shute himself says, we choose to travel by the railway rather than by canal, notwithstanding the greater chance of accidents on the railway. Mr. Shute indicates some of the results of this line of thought, which is still almost unworked. The man of imaginative temper who thinks in concrete images, and is thus able to communicate vivid impressions to others, is by that very faculty "inapt for severe reasoning, and still more for rapid argument"; hence it is not surprising that men of artistic or poetic genius should often appear to be wanting in the sterner qualities of intellectual energy. Finally it is suggested that the acceleration of thought may be still further developed. Our descendants may arrive at a kind of mental shorthand by thinking in terms of *visible written words*, instead of thinking as we now do in terms of *articulate spoken words*—a practice for which the habit of much and quick reading is preparing the way. One thing strikes us as unpleasant in this Utopian vision; if readers were to give up the habit of mentally translating the visible words of the book into audible words, style would come to an end and poetry be impossible. Or what if, between developed symbolical thought and some kind of vastly improved portable type-writer, mankind were to abandon articulate speech altogether?

We have no space left for any account of the last chapter, which deals with "Necessary Truths," and herein of the idea of number, and is in no way inferior to its predecessors. But the reader may gather from what we have already said a sufficient notion of Mr. Shute's general method and manner. The friends of the English school of philosophy will not be slow to welcome him, and its enemies will not be wise if they neglect him.

THE RAJA OF SARAWAK.*

THAT all Englishmen who set a value upon the energy and enterprise of their countrymen should possess a permanent record of Raja Brooke is quite right and proper, and the author of these two volumes has had ample materials, in the shape of letters and journals, to enable her to discharge fully a task which was originally undertaken by Mr. Templer, an intimate friend of the Raja, but which devolved on her at Mr. Templer's death. We learn from the preface that Miss Jacob has recast nearly the whole of the life as originally written by Mr. Templer. We cannot honestly say that the result is very happy. The two volumes

might have been compressed into one. There is a vast amount of reiteration, and now and then a rush of twaddle. Several outbursts of vehemence ought to have been suppressed, and there are whole passages which the Raja, unless we do him injustice, would himself have cancelled on sober reflection. It will no doubt be urged that this memoir purports to represent Brooke faithfully as he thought and wrote, planned and acted, bartered the Foreign Office, and sank piratical crews. But this could have been done by compression, method, and analysis, and with some regard to proportion. The book is accurate, and shows marks of conscientiousness and care. But, though there is a tolerable index, there is neither heading to chapters nor table of contents, and we have had unnecessary trouble in extracting from seven hundred pages the following summary of the Raja's career.

The father of James Brooke was Mr. Thomas Brooke, a Bengal civilian, who went to India in 1779, and who was second Judge of the Court of Appeal at Benares—though Miss Jacob does not tell us this—where his famous son was born in 1803. The father must not be confounded with a certain Augustus Brooke of the same service, about whom and his odd ways, at this very station Benares, and his connexion with a native lady to whom he was always faithful, there are stories current in Anglo-Indian society to this day. Young Brooke was kept in India unusually long, and when sent home at the age of twelve, he was placed at Mr. Valpy's school at Norwich, from which he eventually ran away, with some vague idea, it appears, of going to sea. However, at the age of sixteen he received a commission in the Bengal Infantry, and saw some service in the first Burmese war on the frontiers of Assam. Indeed he got a nasty wound from a slug, which sent him home on sick leave. Here he remained for nearly five years, during which the bullet was extracted, not without difficulty, and his health was finally restored. But there was a stringent military rule, equally applicable to all the East Indian services, that no man could remain absent from India more than five years without forfeiting his commission. The ship in which Brooke was returning made, even for those times, an unusually long passage; and, though it seems to us tolerably clear that, under the peculiar circumstances, the Court of Directors, who had been applied to by the father, would not have rigorously enforced the rule in question, Brooke, with characteristic impetuosity, resigned the service then and there and went straight back to England. This was the turning point in his life. This abrupt termination of an Indian career suggests the thought that Brooke, had he stuck to his profession, would probably have left his mark on India. There was ample room for a man of his talents, either as a dashing commander of irregular horse, or as a diplomatist in the Afghan troubles, or as a Resident at some native Court, and the effect of discipline and subordination on his impulsive temperament would have been both bracing and wholesome. We should have lost, of course, Sarawak; and that episode, which is unique in the nineteenth century, takes us back to Raleigh and Drake.

For the next five years Brooke seems to have led a restless, speculative sort of life. In fact he was always at boiling point, and never happy unless writing essays and forming plans. At one time he wrote a pamphlet, as an enemy to Radicals, answering one on Reform. Then he had thoughts of getting into Parliament; but this fancy was exchanged for an idea that he should like to turn farmer in New Holland, and explore an unknown country. Both then, and in later days, when fully occupied with governing his strange subjects and defying his adversaries, he employed himself at odd times in writing against the Pope, in cutting up the famous No. 90 of the *Oxford Tracts for the Times*, or in pouring out his grievances to some friend. At length his doubts and his difficulties, his cruises in the Mediterranean, his hazy notions of trading in a brig of his own to China, or of getting employed as an attaché abroad or in some Government office, were all ended by his father's death, which event gave him command of 30,000*l.* Old Mr. Brooke, by the way, had saved money, as civilians could do in those happy days; and he seems to have been an acute and not unjudicious father from what little we see of him; for when his son was in the habit of abusing the East India Company—why, it is not very easy to see—and of asking his father for money wherewith to combine discovery and speculation, the old man checked him sarcastically with an intimation that the military service of the Court of Directors, had he stuck to it, was better than trade, and might have led him to distinction. But the die was cast. Master of a good round sum of money, and free to follow his own fancies, he bought a yacht named the *Royalist*, and, at the close of 1838 started for Borneo with the fixed idea of counteracting the policy of the Dutch in the Eastern Archipelago, civilizing the wild tribes of the island, extending British influence, and gaining such a footing as would be attended with commercial and political advantages of no ordinary kind. It is fair to state that this plan seems to have been well thought out, to be less impracticable than others, and to reflect the better parts of his character—earnestness, vigour, resolution, and some adaptation of ends to means. Possibly without knowing it, Brooke had taken a leaf out of the book of his old masters, the much-abused Directors; for he saw that without some territory, and a strong Government to back it, such commercial enterprises would never succeed.

In August 1839 he landed at Kuching, the capital of Sarawak, and was very well received by Muda Hassim, the ruler. At this part of the memoir, Brooke's letters and journals, his impressions of men and manners, his descriptions of unknown rivers and

* *The Raja of Sarawak. An Account of Sir James Brooke, K.C.B., &c., given chiefly through Letters and Journals.* By Gertrude L. Jacob. 2 vols. London: Macmillan & Co.

unexplored jungles, his tact in overcoming difficulties, and the influence he gradually obtained over the minds of nobles and people—carry one on without any feeling of tedium. We gather too that, whether from consciousness of inability to govern, or from the charm of Brooke's manner, or from fear of the Dyaks, Muda Hassim himself was really content to make over the government and the trade of the country to the white-faced adventurer. There were rebels to be put down and pirates to be taught a severe lesson, and Brooke was just the man for this crisis. So, after a good deal of desultory fighting and diplomatic discussion, Muda Hassim formally made over his kingdom of Sarawak to its new master, and eventually procured the assent of his suzerain, the Sultan, to the transfer. Muda Hassim seems by no means to have been immaculate. The Government is described as tyrannical and oppressive, and he seems at one time to have half repented of his agreement, though this hardly warrants the charges of perfidy and ingratitude which Brooke vents against him in his journal. The plain truth is that he coveted the country, though his main object was not selfish aggrandizement, but the suppression of robbery, murder, and slavery. A native nobleman, named Makota, termed in the journal "a mild and gentlemanly rascal," who had been at the head of the army, gave considerable trouble; but, by September 1841, the Englishman had triumphed and the new reign began. From this point the memoir is taken up with Brooke's attempts to collect the revenue, to administer a simple code of laws, to teach the natives the rudiments of civilization, and to put down the atrocities of two tribes of Dyaks, known as those of Sarebus and Sakarran. All this is very animating and instructive, especially when we are told that Brooke trusted entirely to native agency, and had only four Europeans to help him. The effect of the narrative is occasionally spoiled by extravagance of thought and expression, and by Brooke's almost childish anxiety to be knighted; and we think he was wholly mistaken in supposing that any such title would carry weight with the native mind. However, the details of his private and public life, his revenue of 6,000*l.* a year, his farmyard and his five pets, his palace and his country seats, his letters home showing that domestic affections had not lost their hold on him, his expeditions against the strongholds of pirates, in company with Captain, now Sir, H. Keppel, in the *Indo*; the confirmation of his chiefship at the hands of the Sultan of Brunei, or Borneo, in August 1842; his dinners in public and his At-Homes to natives, his regatta on New Year's Day—all these are characteristic, and prove that he led a happy, useful, and in some points an ennobling, life. In the year 1846 a sad calamity befell. Muda Hassim and his brother Badaruddin, a brave and faithful adherent of Brooke's, were massacred by the orders of the Sultan; and this event seems to have inspired the Raja with additional desire to obtain a formal recognition at the hands of the English Government. The summary punishment of the Sultan and his followers ensued, and then came the occupation of the island of Labuan, a measure which was approved of by Lord Palmerston, at that time Foreign Secretary. The Dutch Government here interposed, and endeavoured to show that Brooke's proceedings were inconsistent with the treaty of 1824, but they were most properly met by Lord Aberdeen; and, in the summer of 1847, Brooke, now in the full tide of prosperity, visited England, and found himself the object of universal admiration and honour. He was received at Windsor. He was made a K.C.B. His old schoolfellows formed at Norwich a club of which he was made President. He spoke at dinners and meetings; he was admitted to clubs and literary institutions; he received the freedom of the city; and, in short, just thirty years ago, he was pounced upon as a lion by all classes of society.

In the beginning of 1848 Brooke, surfeited with applause and flattery, which, to do him justice, does not appear to have vitiated his character, returned to the East, holding the double office of Governor of Labuan and Consul-General of Borneo. Previously he had only been acknowledged as Commissioner to the Native States. He took with him his sister's son, who assumed the name of Brooke besides his own of Johnson, and his return was followed by a grand attack on a fleet of pirates, in which vessels of war of H.M.'s navy, aided by a steamer of the Indian Government and by the war-boats of friendly *Datus* made havoc of these sea-robbers. But now came a turn in the tide of success. Brooke had an agent, a Mr. Henry Wise, with whom he quarrelled about some mines of antimony. Wise wrote to the Prime Minister, then Lord John Russell, expressing abhorrence of the treatment of pirates. It was just the kind of letter that might have been written last autumn; other men took up the matter, and on this an attack was made on Brooke by Hume and Cobden in the House of Commons. This part of the memoir, we must confess, becomes extremely wearisome and makes very large demands on our toleration. There was room here for a skilfully condensed account of the main charges against Brooke, of the spirit in which they were met, and of the course taken by the Government of the day. Instead of this, we have official letters, snatches of debates, legal opinions, violent explosions from Brooke himself, a semi-medical narrative of his attack of small-pox and of medicines administered while it lasted, lists of witnesses, letters to friends. The whole is neither well digested nor well arranged. To cut the matter short, the Foreign Office addressed the Board of Control, and Sir Charles Wood, then its President, wrote to the Governor-General, whereupon Lord Dalhousie appointed two Commissioners of Inquiry, the late Charles Prinsep, then Advocate-General of Hongkong and the Hon. H. B. Devereux of the Federal Civil Service.

The proceedings of the Commissioners, who did their duty with impartiality, may very soon be told. A terrible petition, full of charges against Brooke, his cruelty, his selfishness, and so forth, numerous signed, had been forwarded from Singapore; and it was very naturally thought that many persons would be found to come forward and substantiate their accusations before a Commission sitting on the spot. Nothing of the kind occurred, and a local editor, one of Brooke's chief antagonists, had the coolness to propose that the Commissioners themselves should frame charges and hunt up evidence. Of course after this the thing collapsed. Some people who had signed the petition backed out of it, or said that they merely wished an inquiry to be held in order to clear character and get at the truth; evidence as to the misdeeds of the pirates was overwhelming, showing that greater miscreants never hoisted the black flag; and the practical issue of the Commission was to scatter Brooke's opponents, and to confirm the opinion of his proceedings from which well-informed and capable judges, in the Straits and elsewhere, had really never wavered. But the Commission brought out an anomaly in the Raja's position which he himself could not be got to recognize. Brooke had acquired Sarawak as a private person, and had then received, in virtue of that acquisition, an appointment from the Crown. He appears to have thought himself ill used because he could not combine complete independence with power to call to his aid the whole resources and authority of the English Government. In short, from his language, he wanted to be a benevolent autocrat, backed by all the moral and material forces of England whenever he might be hard pressed. It is somewhat amusing to find the Raja, after pages of wholesale and impetuous denunciation of the Government, beginning to suspect that after all his position was not quite so clear as he had thought it, and asking for some works on constitutional history. It requires very little knowledge of international law to see that all kinds of complications might easily arise from any tacit concession of the Raja's claim to independence, and that it would be a most serious thing for the Government of the country to find itself committed to action every time a splendid adventurer succeeded in getting a jungly island or a large slice of territory from some incompetent native chief. The cession of the Fiji Islands to the Imperial Government is one thing. The transfer of Sarawak from Muda Hassim to Muda Brooke is quite another, and involves all sorts of contradictions and anomalies.

We must not forget that this memoir gives prominence to the opinion of the legal member of the Commission, that Brooke, in lending himself to actions against undoubted pirates, had not been wholly able to prevent certain atrocities on the part of his own allies. But the general verdict of the community endorsed the real result of the Commission, and honourably acquitted Brooke. The Foreign Office, with Lord Clarendon at its head, expressed a guarded approval, and the opportunity was taken to relieve the Raja of his appointment as Consul-General and Commissioner. Brooke seems to have been very sore on this point, but by the loss of these appointments he really stood on less equivocal ground. His letters to "Dear Jack" about this time are full of petulance and wild declamation, and are neither becoming nor dignified, after every allowance is made for the feelings of a brave and honourable man snarling under what he deemed unmerited insult. But worse was in store for him than the attacks of local editors or the speeches of philanthropic members of Parliament. A Chinese colony of gold-workers, instigated possibly by the proceedings of Commissioner Yeh, rose in rebellion, massacred several Englishmen, burnt the palace, and drove Brooke to the jungles. However, order was soon restored, and the Chinese were severely punished; but Brooke's work was done. In 1858 he went home to find that the tide had again turned in his favour. Subscriptions were got up to reimburse him for his losses; friends rallied round him, and the press bore testimony to the soundness of his measures and the good effect of his rule. The rest of his career is rather sad. He was struck with paralysis in October 1858, and though he partly rallied from the attack and was enabled to visit the East again, the old fires were extinguished. Finally he settled in Devonshire, where he enjoyed beautiful scenery and the friendship and esteem of friends, till he quietly passed away in June 1868.

Readers of these volumes will have little difficulty in drawing that "general summary of his character," and in estimating the "importance of his work," which the editor expressly declines to attempt. That Brooke was a man of noble impulses, generous feelings, and chivalrous self-denial; that he possessed exactly those qualities which hold fierce savages in awe, or win them over to better ways; that his chief motive in life was not aggrandizement or love of money; and that in all his writings and actions there was nothing cruel, sordid, or mean, will, we think, be conceded by all the readers of this biography. He made many friends, though he did not always retain them, and no one can wonder at the high place assigned to him in his regard by Charles Kingsley. But, to speak plainly, Brooke was intolerant of opposition, and little disposed to make any allowance for others; and there are occasional flashes in his temperament which show that he must have been difficult to deal with, unless he had entirely his own way. But, though hot and impatient, he was never rancorous or vindictive, and our notice of these blemishes in his character must not prevent us from paying a cordial tribute to the purity of his motives, and from acknowledging the lustre shed by his unassisted efforts on the national character and the British name.

ARNOLD'S LAST ESSAYS ON CHURCH AND RELIGION.*

IF Bishop Butler had written an *opus magnum* when he was fifty-four years of age, it would have been, if not "entirely satisfactory" to Mr. Matthew Arnold, at least more nearly so, and therefore more nearly within the field of vision permitted to modern culture, than either the *Analogy*, which was written at forty-four, or the *Sermons at the Rolls*, which were published ten years earlier still, and which were preached during the eight years when University tutors and lecturers are for the most part supposed, as the chronology-books have it, to "flourish"—"between the twenty-sixth year of his life and the thirty-fourth"; an age at which "the man is hardly ripe for" "attempting a highly systematic, intricate theory of human nature and morals," "and, if he does attempt it, it cannot well be satisfactory." At thirty-four "the man" is not mellow; he is only about half-ripe, but just in the condition when young people, fearless for teeth and digestion alike, pluck and taste him eagerly; exactly ripe enough, in fact, to become a Professor of Poetry, but not matured sufficiently for *Last Essays on Church and Religion*. To attempt a "systematic theory" on high subjects such as these, a man must be, as we gather from Mr. Arnold himself, exactly fifty-four; although whether the "attempt" made at this "more mature age" would have been "entirely satisfactory" to Bishop Butler we should hesitate to affirm. Nor is there any necessity to form an opinion on the point; for, in the first place, Bishop Butler has been dead a very long time, and, as a second and far more melancholy thought, the *Zeit-Geist* has got hold of him, and has been making terrible work with his remains. Our own earlier days received reiterated assurances from the University pulpit that these remains were "immortal"; but then the "Doctors, Proctors, and all Heads and Governors of Colleges and Halls" had been too short-sighted to mark the advancing form of the *Zeit-Geist*, who was drawing near all the while, like the monster in the *Shepherd of Hermas*, hidden in a cloud of dust, but with a rush *εὐρεθὺν αὐτὸ πάλιν λυμάναι* before which even Oxford must go down. With the help of Hermas and of the "Dragon of Wantley" it may be possible to form some faint conception of this appalling German visitant. He reaches Oxford. He sees the *Analogy* somewhere in the Schools; he "breathes upon it, and we rub our eyes"—or Mr. Arnold rubs them for us—the *Analogy* "has the spell and power no longer"; it "is a failure, it does not serve." Fortunately, however, the Time-Spirit has not quite scorched it up, and there is still a good deal left both of *Analogy* and *Sermons* for the essayist to quote and to expound.

Although Mr. Arnold's modesty has prevented him from describing his literary attempt as an *opus magnum*, he does offer it to our notice as an *opus supremum*; and in this we must frankly say—even at the risk of the *Zeit-Geist* being let loose and set upon us—he is just a little irritating. "For the last time," the author anxiously impresses on the world, he is speaking on the questions of which here he treats. These are "Last Essays"; "the present volume closes the series." If the world will hear him at all, it must be now or never. "What I wished to say has been said." This is very solemn and impressive, no doubt; but yet one is not impressed. Last words have their times and seasons, when they may be fitly spoken and when they are heard with respect. They are an acknowledged privilege of the very old. Even at earlier periods of life occasion may have rendered a last speech conventional or customary; as when life was to be yielded, in ancient time on the altar of patriotism, in modern experience to the claims of justice. Special or local circumstances, too, may call for a special or local farewell; but this sounding valediction by a middle-aged essayist, what is it all about? A course of lectures may come to an end because the subject is exhausted; the history of a special art brought down to the present time, or the available materials for a biography all set in order. But *Last Essays on Church and Religion*, as a title, is apt to suggest the question, Who is this Seraphic Doctor, that he should solemnly shut the doors of the Divinity School in our sight, and put the key in his pocket? We do not justify this dissatisfied and resentful frame of mind. On the contrary, we are disposed to apply, and to carry to its legitimate conclusion, the axiom of Butler, of which the author more than once reminds us—"Things are what they are." These "Last Essays" "are what they are"; and, being so, we are glad to hear that they are the last, and we hope that they will so prove. They are four in number, and the last of them, in which the writer does "really take leave of the question of Church and Dissent, as I promised," leaves the reader as he turns its closing pages in much perplexity of mind. Even on so dismal a subject as the Burials Bill one looks for some sweetness and light, and for an atmosphere of "grace and peace," from the matured apostle of culture. Mr. Arnold does not appreciate Dissenters very much, and does not find even the Bishops and clergy "entirely satisfactory." Indeed at times he may almost seem to have gained Lord Byron's eminence of social impartiality, and to "hate most people and dislike the rest"; but his "sweet reasonableness" must surely accompany him even to this point of view. He will not hear of the Dissenters having their way about burials; they have no right to ask for it, and there is an end of the matter. The clergy are not to have their way either; the "un-baptized" rubric must go, because St. Paul was "not sent to baptize" as a matter of fact, whatever may have been the reason which

the Apostle alleges in explanation, to which it is apparently needless to refer. This is all natural enough; but some of Mr. Arnold's Dissenters get harder measure at his hands than they could fairly expect. We shall not be suspected of any undue admiration for the type of political Dissenter which flourishes at Birmingham. In an article some time since we took occasion to disclaim the allegiance which the hardware metropolis demands as its due from all the realm of human thought; but though we cannot allow that the sanctities of Delphi or the grandeur of Rome find their renewal in that electro-plated shrine, its political priesthood are our fellow-creatures still. "Mr. Dale" may be "really a pugilist, a brilliant pugilist," and may have "his arena down at Birmingham, where he does his practice with Mr. Chamberlain, and Mr. Jesse Collings, and the rest of his band." But "Mr. John Morley" is neither a Birmingham man nor a pugilist. He "is a lover of culture, and of elevation," and of we know not how many graces and cardinal virtues besides. "Scio, rex Agrippa, quia credis," cries the modern St. Paul, with affectionate energy; but, alas! with an afterthought of pain—"He is keeping company with his Festus Chamberlain and his Drusilla Collings, and cannot openly avow the truth; but in his heart he consents to it." This is very eloquent, yet the reader is perplexed. Has the *Zeit-Geist* been breathing on the Acts of the Apostles? Or is Mr. Arnold quoting from some Unauthorized Version known at present only to himself? In either case Mr. Jesse Collings is a hardly-used man. Drusilla was certainly a model of female beauty, but history does not say as much for her reputation; and what in the world she has to do either with poor Mr. Collings or with Festus we have not the remotest idea. Perhaps Mr. Arnold's historical intuition has discovered that "when Festus came into Felix' room" the lady chose to worship the rising sun; but as in that event she must have deserted two husbands instead of one, the hardship on Mr. Collings is greater than ever. He may, however, derive some consolation from the reflection that Mr. Arnold's historical parallels, thrown off by the way, are not likely to be more clear to the popular intelligence than the "Psychological Parallel" to which he has devoted so large a portion of his "Last Essays."

Under this title we have the first and most important of the four Essays, which proposes for its immediate aim the rehabilitation of St. Paul. As yet the *Zeit-Geist* does not seem to have fastened on "the great Apostle of the Gentiles," possibly from a prudent remembrance of the fate of another "beast" which did; but there is no knowing what may happen, and St. Paul is suspiciously mixed up with that "traditional religion" which is "obsolete already," and will not, in fact, hold out long. Mr. Arnold means to save St. Paul if he can. He was a good deal "mistaken" on various points, "undeniably"; but really he was not "an imbecile and credulous enthusiast, and an unprofitable guide," if we will only make reasonable allowances for him. "The miracles of our traditional religion, like other miracles, did not happen." St. Paul "entertained the belief" that they, or at least some of them, did happen; but that is very easily explained by the help of a "psychological parallel," and we do not quite wish to part company with St. Paul. "His writings are in every one's hands. I have myself discussed his doctrine at length." St. Paul might perhaps prove somewhat hard to get rid of, even in the Church of England as by Mr. Arnold established, and proclaimed by anticipation to the London clergy in the Hall of St. John College. And it is but common justice to the author to acknowledge his evident and deep reverence for St. Paul, as shown throughout the long "discussion of his doctrine" in *St. Paul and Protestantism*. If the "Psychological Parallel," as it stands, be something beside the mark, at least it provides a line of defence which may be urged in behalf of its draftsman. He is, let us suppose, "undeniably mistaken"; but a charitable hypothesis will readily excuse the mistakes. What the "parallel" of the Essay really is after the closest examination we have failed to discover. There may be two parallels; or there may be none at all; the "psychological" problem is too deep. But it appears that Sir Matthew Hale condemned two old women to death for witchcraft; and that one John Smith, a Fellow of Queen's College, Cambridge, who died at the "hardly ripe" age of thirty-four, "was required," in obedience to a custom of his College, "to preach, on one Lady-day about 1649, 'at Huntingdon, a sermon against witchcraft and diabolical contracts.'" Sir Matthew Hale believed in witchcraft; of the existence of witches "he made no doubt at all." The Fellow of Queen's, if he shared the belief of the Judge, so far contrived to qualify its expression, that he receives great praise from Mr. Arnold for "confuting" it. "O fortunate Huntingdon Church, which admitted for even one day such a counterblast to doctrines then sounding from every pulpit, and still enjoined by Sir Robert Phillimore!" As Sir Robert Phillimore does not, so far as we know, enjoin the doctrine of witchcraft, the "parallel," if there be one, would appear to be somewhat as follows:—Because Sir Matthew Hale believed in the existence of witches, and because a Fellow of Queen's did not believe something which Sir Robert Phillimore now enjoins, therefore St. Paul cannot be characterized as an imbecile and credulous enthusiast for "believing in the miracle of the Resurrection, both of" that which Kater commemorates "and of mankind at large." At this point we pause; for our criticism does not enter within the boundaries thus reached.

The Church of the future, not neglecting the study of the *Beehive*, will be allowed, and even recommended, to read the Bible. The *Beehive* was, indeed, to a large extent, "poetry"; there is also

* *Last Essays on Church and Religion*. By Matthew Arnold, formerly Fellow of Balliol College, in the University of Oxford, and Fellow of Oriel.

a considerable deposit of, let us say, "tradition"; but it enshrines a good deal of "natural truth" as well; and "finely-touched souls have a presentiment of a thing's natural truth, even though it be questioned," and be as yet only "expecting the testimony from experience to its intrinsic truth and weight," as just now happens to be the case with one of "the two great Christian virtues, chastity." "As a mere commandment this virtue cannot have the authority which it once had"; still, provisionally and for the present, the Seventh Commandment may supply the want of "proof by experience." One book, however, "is full of interest, and every one should read it." It is one of the quarries from which much of the material of the New Testament was hewn, and belongs to "the later decades" of the same second century B.C. in whose "earlier decades" "the Book of Daniel was written." This is the Book of Enoch; and, as every one ought to read it, Mr. Arnold has kindly acted as our guide to the fulfilment of so plain a duty. "The Hebrew original and the Greek version, as is well known, are lost"; but "an Æthiopic manuscript was brought to this country by Bruce," and "there is an excellent German version." Archbishop Laurence translated it into English, but his "English version cannot be trusted," and therefore of course ought not to be read. Every one knows how the Curator of the Museum containing Balaam's sword disposed of the captious objection that Balaam had no sword, but only wished for one; "this is the very sword he wished for." In like manner, the version of the Book of Enoch which "every one should read" is "the book correctly in English," which, Mr. Arnold writes, "I wish that the Bishop of Gloucester and Bristol, who is, I believe, an Æthiopic scholar, would give us." It would enable us to understand the "employment"—not by St. Paul—of "contemporaries' ready-made notions of hell and judgment, as sanctions of the doctrine declared."

We are told by scientific English corn-growers, who are also consumers, that they get better bread by purchasing flour from their millers than by having their own wheat ground. The miller knows how to mix judiciously grain from the four quarters of the globe. Mr. Arnold, in like manner, has a method of rendering the material of the Evangelists more wholesome than it can be in its ordinary form, and provides us—as a specimen, we suppose—with three pages and a half of mixed Gospels, by which we may "enable ourselves" to understand the original meaning of teachings which the "disciples came with ease to mistake." To these we are, of course, unable more particularly to refer; but the preface with which the compiler introduces "the series" is deserving of study. "For fear," he writes, "this essay should seem to want due balance, let me end with what a man who writes it down for himself, and meditates on it, and entitles it Christ's religion, will not, perhaps, go far wrong." The old Eton Grammar taught us, "Aliquando oratio est verbo nominativus," and the illustrating example must have been quite to Mr. Arnold's heart. He is a little given himself to illustrate the rule in his own writings, and occasionally uses an "oratio" where less cultured folk are content with a traditional monosyllable; but the rule, however valuable, scarcely supersedes all the remaining canons of customary syntax. In one respect the mixed Evangelistic food which the writer thus commends to us suggests an encouraging hope. If the prophets of the new light go on as they are promising to do, we shall have a very orthodox joint-stock *summa theologiae* in time. To one recent and well-known work of this school "traditional Christianity" is indebted for an elaborate and convincing proof of the apostolic authorship of the Apocalypse of St. John, which has been much questioned of late. But to no one point does "tradition" more closely cling, and in no one respect are her "notions" more usually set aside as "obsolete" by her new teachers, than where she rests on the genuineness and authority of what it is now the fashion to describe as "the fourth Gospel"—a sort of "religious drama," we have been told, very excellent as poetry, but of unknown date, and embodying the devout imagination of a later theology in phrases which must have been foreign to the thought of an unlettered Galilean fisherman. Mr. Arnold's series of "well-known sayings" held by him to be unquestionably genuine consists, as to more than half of the entire collection, of extracts from the Gospel of St. John. He has told us that one of his foreign critics "objects to his picking and choosing among the records" of the Gospel; and to such "picking and choosing" as this the Continental liberalism which he describes as profoundly hostile to Christianity may very naturally object. At fifty-four a man of matured mind and ordinary health has a good prospect of life before him; and in that time Mr. Arnold will probably learn that mistakes in popular religion may easily be accounted for without charging them upon the Evangelical and Apostolic records, while he will only become more assuredly convinced of the truth, both natural and traditional, of the principle on which he insists, "Christianity will find the ways for its own future. What is certain is that it will not disappear."

THE HOLBEIN SOCIETY.*

THE object of this Society is to reproduce in exact form and style early printed books which engaged in their illustration the skill of distinguished engravers. Some of these works,

such as *The Dance of Death*, are identified with the genius of Holbein, a representative artist who not inappropriately gives his name to the Society. But Mr. Wornum, in his *Life of the painter of Basel*, does his utmost to shake the commonly accredited connexion between Holbein and *The Dance of Death*. As to the celebrated wall-paintings illustrative of the weird dance, they are now by pretty general consent assigned to other hands. And as for the no less remarkable series of woodcuts, of which an all but complete set is in the British Museum, doubts are entertained as to who was the engraver; but as to the original designs, even Mr. Wornum "cannot but believe" that they are by Holbein; "they bear," he says, "in their vigour and dignity an internal evidence of the master's hand." Mr. Wornum dedicates the *Life of Holbein* "to my friend John Ruskin," who in his lectures as Slade Professor maintains that the old wood-engravers were so much of artists and so completely masters of "the general system of intelligent manipulation," "that it is impossible to say of any standard old woodcut whether the draughtsman engraved it himself or not. I should imagine," continues Mr. Ruskin, "from the character and subtlety of the touch, that every line of the 'Dance of Death' had been engraved by Holbein; we know it was not, and that there can be no certainty given by even the finest pieces of wood execution of anything more than perfect harmony between the designer and workman." The polemics on these moot points cover a considerable surface, and the authorities are so divided that the Society may be allowed to indulge in the opinion "that Holbein, from his early youth in 1511, when he was only thirteen years of age, was famed for the excellence of his engravings on wood; and though as a painter, especially during his residence in England, which began in 1526, he gained a far higher renown, increasing until his death in 1554, his name may very appropriately be assumed by a Society that aims at reproducing, in exact form and style, some of his more beautiful works." In fixing on a name for this well-meaning Association, the choice must have lain between Holbein and Dürer. The claims of Holbein rest on a "sum total of about three hundred and fifteen pieces and perhaps twenty alphabets." In the comparison almost inevitably provoked between the two leading artists of Southern Germany, Woltmann pronounces the verdict that "the only man in German art who has reached true perfection of form is Holbein, and Holbein alone." This opinion, which cannot, however, be received as dogmatically infallible, may be satisfactory to "the Holbein Society."

The scheme of the Society is not ill conceived. The idea was to issue at a reasonable cost to members and the outside public a series of photo-lithographic reprints, accompanied by explanatory notes, of rare volumes in which literature and art are combined. The Council considered themselves fortunate in obtaining for several of their facsimile reproductions the assistance, as literary editor, of the Rev. Henry Green, who conducted the facsimile reprint of Whitney's "Emblems." Objection has with reason been taken to the blurred lines, to the faint, and sometimes black, printing of the illustrations published by the Holbein Society. These defects, however, seem in some degree inevitable; and it is urged in the preface to *The Mirror of Maiestie; or the Badges of Honour Concretedly Emblazoned*, that "the Photolith Plates annexed for illustration supply good examples of the proper office of the Photographer, as an artist, in facsimile reprinting. The Arms and Emblems of this work, as well as the letterpress, were, when first published in 1618, of defective execution, without finish in the woodcuts, and without sharpness or shapeliness in the type. Such faults might be urged as reasons for not reproducing the volume; but then its extreme rarity, and the nature of its contents, plead in behalf of making the possession of a copy attainable at a moderate price." The value of the boon conferred upon students may be inferred from the fact that the original copy from which these facsimile reproductions were taken realized on sale by auction the high price of 36*l*. The practice of the Council has been, first, to search out the best extant exemplars of any work, and then to set the photographer to exercise his utmost skill in honestly making a truthful reproduction. It might have been easy by the hands of skilled engravers to improve on the original woodcut, and by the general appliances of modern art to elaborate a finished picture; but the Holbein Society, unlike the Arundel Society, held that in a facsimile copy absolute fidelity to the original is the first thing to be thought of. The utmost license allowed has been to restore lines and borders, where evidently broken, to their first estate; and for the purpose of filling in such blank spaces several exemplars are collated so that the defects of one may be supplied by the excellences of others. With these replica originals the photo-lithographic transcripts are closely compared, and unless the workmanship be found up to the mark "other proofs are taken before the editors give forth the imprimatur." We are asked then to accept shortcomings and comparative failures, which seldom, however, materially interfere with the intelligibility of the subjects, as evidence of honesty. Mr. Alfred Aspland, the present literary editor of the Society, has been engaged on the *Golden Legend*; he proposed to reproduce the plates from the fine German edition, and to give a chapter or two as an appendix from Caxton's book. A recent announcement indicates some change in the first intention. The reproduction, it appears, will come out as "*Carion Golden Legend*," printed by Caxton in 1483, with a selection of the illustrations from the Antwerp Edition of 1505. It is stated that, as a specimen of Caxton's printing and the style of engraving on wood in his time, the work cannot fail of interest. The wood-

* *The Holbein Society's Facsimile Reprints.—The Fall of Man*, by Albrecht Altdorfer. Edited by Alfred Aspland, F.R.H.S. With an Introduction by William Bell Scott. Published for the Holbein Society, by A. Brothers, Manchester, and Triibner & Co., London. 1876.

cuts, it is hoped, can with care be fairly well reproduced by the heliographic process already employed by the Council.

The most recent publication of this persistent Society is *The Fall of Man* by Albrecht Altdorfer. The facsimile reproductions from forty designs, beginning with "Adam and Eve eating the Forbidden Fruit," and ending with "The Madonna Glorified," will scarcely escape the charge of painful indistinctness for which the process has been frequently made responsible. It may be scarcely fair to institute a comparison between this praiseworthy but not wholly successful attempt, and a small volume entitled *The Humiliation and Exaltation of our Redeemer in Thirty-two Prints, representing the Original Wood-Blocks of Albert Dürer*. The editor of these priceless materials, the Rev. John Allen, Archdeacon of Salop, and lately one of the Inspectors of Schools, issued the little book with an interesting statement. He pointed to the fact that thirty-five of the original woodcuts of Albert Dürer's "Smaller Passion" are in the Print Room of the British Museum. "From these blocks casts were taken, and type metal copies, so that, allowance being made for the dressing necessary on account of the worm-holes, the prints may be fairly said to represent the original wood blocks." "I hope," continues Mr. Allen, "that an impression of the following thirty-two prints, at the cost of a shilling, may bring thousands under the influence of one of the greatest men of his time—the friend of Erasmus and of Melancthon—speaking to us across three centuries through the universal language of his art." This preface is dated as far back as 1856, and though the twenty years intervening between that date and the present day have been singularly abundant in methods of reproduction and permanent processes of printing from photographic impressions, we know of no better results than these prints from casts taken from the original wood blocks. The misfortune, however, is that the old blocks either seldom exist or are rarely accessible for reproduction. Still we would throw out to the Holbein Society these transcripts from Dürer's "Passion" as an example worth following whenever a practicable opportunity may occur. We also recall other methods of reproduction—those, for example, employed in the sumptuous albums to M. Labarte's *Histoire des Arts Industriels au Moyen-âge et à l'Époque de la Renaissance*. A photo-litho process applied with signal success to the facsimile representation of an ivory of the ninth century is described as follows:—"L'ivoire a été photographié dans sa grandeur par M. Berthier, et le cliché photographique transporté sur une pierre qui n'a pas été retouchée." We regret to add that this plate, prepared and printed in Paris, has considerably faded during the twelve years it has been on our bookshelves. On the other hand it must be admitted that the prints published by the Holbein Society bear the signs of permanence.

Mr. W. B. Scott, who writes the introduction to *The Fall of Man* and to the works of the artist Albrecht Altdorfer, speaks with authority on Dürer as well as on "the Little Masters." Albrecht Altdorfer has been called by some French writers "the little Albert," because most of his works, which are somewhat in Dürer's manner, are small in scale. He was painter, engraver on copper, and designer on wood; and that he actually cut the blocks with his own hands has been admitted by good authorities; altogether Altdorfer is regarded as one of the most eminent artists that Bavaria had produced up to the beginning of the sixteenth century. His woodcuts are less than one hundred in number, his copper engravings are rather above one hundred, his drawings are rare—two, however, are in the British Museum—his pictures also are scarce; one is in the Louvre, two are in Munich, and none in England. The artist died in 1538 in Ratisbon, at the comparatively early age of fifty; unlike many of his brethren, he remained a Roman Catholic to the last.

Altdorfer belonged to the company of seven artists who went by the name of "the Little Masters of Nuremberg," an appellation suggested by the miniature proportions of their productions, which, however, within a small compass concentrated noble qualities of invention and high powers of design. This constellation of talent is supposed to have been drawn together by Dürer, who, in contradistinction to "little," may be designated the great master of Nuremberg. These artists in little, if not actually working as pupils in the studio of the master-mind, were inspired by his presence and guided by the study of his works—such as "The Melancholia," and "The Knight, Death, and the Devil." It is probable that they all came in personal contact with Dürer, "that they associated together when young men, emulating each other, and doing their earlier works in the light of friendship." In the treatment of subjects they possessed a common character different from that of Marc' Antonio and his Italian companions. Mr. Scott, in his *Life of Dürer*, reviewed in our columns, contends that the Italian engravers were exclusively copyists, while the Germans were inventors, and therefore artists in a much higher sense. In the great period in Germany engravers worked out their ideas as painters do. Again, in the illustration of the Old and the New Testaments, how great is the contrast between Germany and Italy! In Germany, where the seeds of the Reformation had taken root in many an artist mind, sacred characters assume the garb and the manners common to Nuremberg, while in Italy Biblical themes are kept at a distance from everyday life by generalized and ideal forms and semi-classic draperies. The sympathies of Mr. Scott certainly do not lie with the Italians:—

Sooner or later [he writes], I have no doubt, some solid and tangible proof will be produced of the German or Flemish origin of printing from

engraved copper-plates which will show that the vulgar story of the Florentine scribe-worker was only a piece of private gossip, and that the spirit of the age was impelling him to invent again what was already practised on the further side of the Alps. Block-books, type-printing, wood-engraving, *chiaroscuro* prints, i.e. prints produced by repeated application of separate stamps, and etching, are all now resigned to German claimants; and already in engraving proper on copper-plates for printing, the diligence of northern critics has carried us further back than Vasari's date of 1452.

The Holbein Society has worked a rich mine; sometimes the art may strike the eye as archaic, but the multitude, the worth, and the boldness of the ideas feed and stimulate the mind. Holbein's "Dance of Death" and Burgkmair's "Triumph of Maximilian," though well known, still lie rather beyond the beaten track; and as for invention, curious design, conceits of composition, and out-of-the-way thought, remote from modern modes of poetic conception and artistic form, exceptional interest attaches to "The Mirror of Maiestie," "The Four Fountains of the Emblems of Alciat," and "Alciat's Emblems in their Full Stream." Having thus begun their labours with the Fatherland, the Society propose to make a descent upon the fertile plains of Italy, and to render familiar to the English reader engravings in which are found the unfettered expression of the genius of Pollajuolo, Mantegna, Botticelli, and Titian. The territory already overrun, or yet to be occupied, in Germany and Italy is wide and diversified; artists disdaining finical finish often expressed their thoughts through the graver with the freedom, fluency, and fertility of ballad rhymesters or extempore speakers. The ideas, especially in the "Emblems," though not always complete in their beginning, middle, or rounding off, are usually suggestive of further ideas. These pictorial Emblems recall the quaint address with which Francis Quarles introduces his poetic Emblems to the reader. An "Emblem," he urges, is "but a silent parable. And why not as well presented to the eye as to the ear? Before the knowledge of letters, God was known by hieroglyphics. And indeed what are the heavens, the earth, nay, every creature, but Hieroglyphics and Emblems of His glory. Reader, farowell!"

LUARD'S RELATIONS BETWEEN ENGLAND AND ROME.*

THIS small publication of Mr. Luard's—we can hardly call it a pamphlet—is of a kind more common in Germany than in England. It is a kind of *Regesta* of the Papal correspondence with England for sixteen years. We can hardly call it a calendar, because it is put together from a great number of distinct sources, and it is furnished with a commentary at the beginning and the ending and wherever else Mr. Luard thinks good. No one has a better right than Mr. Luard, the editor of Matthew Paris and of so many of the monastic annals, to deal with any aspect of the period of English history which he has here taken in hand. It may be defined as the dull part of the reign of Henry the Third, the time before Simon. Dr. Shirley said long ago that it supplied but small material for a "drum and trumpet historian." Mr. Luard is assuredly not a drum and trumpet historian; but he is, as Dr. Shirley was, fully alive to the importance of the time. It is not a stirring time; the great constitutional struggle of the reign has hardly begun; but things were in a manner making themselves ready for the constitutional struggle. Mr. Luard, however, has a special and not a general object in view. His business is not with the general history of the English nation or of the English Church during these years, but with their special relations to the see of Rome. It must be remembered that this is the time in our whole history when that relation was closest. John had only just before commended his kingdom to the Pope, and the Popes Honorius the Third and Gregory the Ninth were not inclined to let the commendation be a dead letter. The King of the French deemed himself the overlord of the Duke of the Normans; the King of the English deemed himself the overlord of the King of Scots. But it is quite certain that no French or English King ever took upon himself, as a matter of ordinary government and not of warlike intervention, to interfere with the internal affairs of either Normandy or Scotland in the way in which these pontiffs constantly interfered with the internal affairs of England. The Pope as overlord had great advantages over any temporal lord. His claims in virtue of the commendation of John could be mixed up with the general Papal claims as understood by Innocent the Third so as to give the Pope a decent excuse for meddling with almost anything of any kind, great or small, which went on in the kingdom of England. At that particular moment, too, the minority of Henry gave the Popes a further advantage. The lord might give himself out as the legal guardian of his youthful vassal; the chief bishop of Christendom might give himself out as the natural protector of the weak and helpless everywhere. This state of things should be carefully borne in mind. Careless readers are apt to look on the submission of John as a momentary national disgrace, and as nothing but a momentary national disgrace. A national disgrace it undoubtedly was, though not at all one of the depth and blackness which it is apt to seem to us now. There was nothing degrading in the relation of vassalage; if John became the man of the Pope, Richard had before him become the

* On the Relations between England and Rome during the Earlier Portion of the Reign of Henry III. By Henry Richards Luard, B.D. Cambridge: Deighton & Co. London: Bell. 1877.

man of the Empire. And, in any event, the submission was not. For the Pope understood the matter, the commendation was meant to be a very real thing indeed; and a very real thing they made of it during the years which Mr. Luard has here taken in hand.

Mr. Luard takes things very calmly; he is no violent partisan of any side, but he certainly is inclined to be more favourable to the Pope and his power than most Englishmen will like, or than is at all in accordance with the general spirit of recent English historians. He tells us that the theory of national Churches, "however suited to a time like our own, was utterly alien from the mind of Europe in the middle ages." He adds:—

Nations themselves were not so clearly marked as they became afterwards. The large continental possessions of the English kings would prevent anything like the idea of England being separated from or having little interest in the rest of Europe. The theory of the Roman empire would tend to bind all the nations of the continent of Europe together. And this tended to keep away the sense of isolation from the Church of England. A John of Salisbury is made Bishop of Chartres without there being any thought of unfitness in one who had spent his life in England being put over the diocese of a foreign country. A William of Coutances, after being Bishop of Lincoln, goes back to Normandy, and dies as Archbishop of Rouen.

Is not Mr. Luard here extending over the whole of the middle ages a state of things which was simply the result of the political circumstances of England during a few generations, especially during the first two or three generations of the Angevin dynasty? Under the Norman and Angevin Kings, when England was under the same sovereign with a greater or smaller territory on the Continent, there was nothing at all wonderful in bishops passing to and fro between the insular and the continental parts of the common sovereign's dominions. It was no more than sending English bishops to Ireland in modern times. And when once it had become possible for a native of the continent to become a bishop in England, and for a native of England to become a bishop on the continent, it is not wonderful if the interchange sometimes overstepped the bounds of the King of England's continental dominions. Henry the Second brought St. Hugh from the royal Burgundy to England. John of Salisbury, as Mr. Luard remarks, became Bishop of Chartres. We do not know that there is any evidence to show whether John of Salisbury was of English or Norman descent. It is eminently characteristic of his time that there should be no such evidence. But, on the one hand, if he was of Norman descent, he was English by birth and thoroughly English in feeling; on the other hand, if he was of English descent, he must have been as well able to speak French as any Norman. No one would have thought him unfit for a bishopric in Normandy; and, if fit for a bishopric in Normandy, he was equally fit for one in France. On the other hand, for political reasons, he was much more likely to get a bishopric in France than either in England or in Normandy. But this interchange between England and the continent is simply the result of the political circumstances of England for a time of about two hundred years. It begins with Edward the Confessor; it ends with Henry the Third. After the Church of England was able to walk alone, we had no foreign archbishop before Robert of Jumieges; we had none after Boniface of Savoy. Foreign bishops are common enough from the middle of the eleventh century to the middle of the thirteenth. We seldom or never hear of them before the former of those dates; after the latter, when we find them, they are commonly Italians thrust in by the Pope. It is quite true, as Mr. Luard says, that nations were not then so distinctly marked as they were afterwards. But the English nation was surely marked clearly enough; and surely too Matthew Paris and others of his day had a clear notion enough of a national Church.

Mr. Luard, without being at all a Papal partisan, is clearly willing to make out as good a case for the Papal power as fairness will let him. Thus he quotes Mr. Finlay to show that the nations which admitted the Pope's authority were progressive during the time when the Pope's authority was at its height, while the nations of the East which did not admit it were not progressive. This is perfectly true; but it hardly follows that the difference between progress and no progress was owing to the acceptance or non-acceptance of the supremacy of the Pope. The question is rather between a civilization far higher in itself but traditional, conservative without hope of further improvement, therefore with every chance of decay—the civilization, in short, of an old power which had lived on by a kind of miracle through the magic of a name and the strength of a city—and a civilization far lower than itself, but with every hope of further improvement—the civilization, in short, of young nations with their historical future before them. Mr. Luard might have founded a better argument on the difference between the historical position of Catholic Hungary and Orthodox Serbia. The difference doubtless was owing to the fact that one was Catholic and the other Orthodox. But it does not therefore follow that submission or non-submission to the Pope had anything directly to do with it. Hungary, being Catholic, was drawn within the circle of the progressive West; Serbia, being Orthodox, was drawn within the circle of the non-progressive East. If we carried out the comparison between the historical position of Hungary and Serbia more in detail, the gap between the two would be found to be less wide than it seems at first sight. Still it is wide enough to make the general contrast a fair one; but it does not at all follow that the question of Pope or no Pope is the one key to the contrast. The difference between the Eastern and the Western Empires in themselves, quite irrespective of Popes, will surely account for a good deal.

Mr. Luard brings out strongly that the succession of Henry the Third to the crown was mainly due to the Cardinal Walo, or Guala, or however we are to spell him. Mr. Luard stands up for his general character against Dr. Shirley, but he cannot deny that Walo feathered his own nest pretty comfortably. Yet we can half forgive him for the sake of St. Andrew's church at Vercelli. But he adds that "it would be a great error to suppose either that the object of the Roman Court in fixing the young Plantagenet on the throne of England was to deliver England from a foreign yoke, or that the Barons were not true to their country when they invited Louis over." Of the former part of this position there can be no doubt. And we are not at all inclined harshly to blame the barons for what they did in a fit of despair. They are not likely to have been greatly swayed by the long legal and genealogical pleadings on behalf of Lewis. They sent for Lewis because there was nobody better to be had. We might wish that they had sent for Saxon Otto rather than for French Lewis, but Otto was the cherished nephew of the King whom they were striving against, and his star was just then grievously sinking. We cannot wholly follow Mr. Luard when he says, "That there was any feeling in England against Louis as a foreigner is very improbable." Personally it may well be that the Frenchman was no more foreign to either Normans or Englishmen than the Angevin was. But it is quite certain that, by the time of the battle of Lincoln, English national feeling was strongly stirred up. Men went forth to war with the foreigner as to a crusade.

Mr. Luard ends his *Regesta* in 1235. And he adds a few words on behalf of the Legate Otto who came to England in 1237. But he has to give him up on the point which always came most nearly home to our forefathers, his endless exactions of money. On this score Mr. Luard has to give up the Pope and all their belongings. It is perfectly true that Innocent the Third gave us Stephen Langton; it is equally true that Stephen Langton won his chief glory in withstanding the power which gave him to us. And no doubt Innocent the Third or any other Pope might, when there was nothing to tempt them to do otherwise, make a good appointment rather than a bad one. But Mr. Luard does not hide the fact that

In 1240 the Pope [Gregory the Ninth] sent to the Archbishop and the Bishops of Lincoln and Salisbury, requiring them to provide for three hundred Romans in the first vacant benefices, and suspending them from giving away any benefices till that number was provided for.

It is really hard to see how any form of extortion or simony, or any other branch of right and law, could go beyond this. Mr. Luard himself brings together a large number of Papal exactions of the same kind, some of which he himself brands as "monstrous." It is not wonderful that our forefathers loathed the name of the Pope and all that belonged to him, and thought he was called *Papa* because he was always saying "pay, pay."

We need not say that all the part which we call the *Regesta* is most carefully put together. A list of the Papal letters in this shape shows how fast they came on one another, and the endless range of the subjects with which they deal. We light on one which is at all events harmless. On March 19, 1217, that is before the Fair of Lincoln, "Guala is directed to inquire into the petition of the Dean and Chapter of the Church of Salisbury, that the apostolic see would provide for the unhealthiness of the cathedral close, which is dangerous for the canons and clerks." We thus get a little hint as to the pleasures of keeping residence at Old Sarum, about which William of Malmesbury has more to tell us. It was not many years before the Dardanië of the Wilscastas was exchanged for their holy Ilios in the plain.

MIGNON.*

WRITERS of fiction have two kinds of improbability to avoid—the one of fact, the other of character; but few know where the pitfalls lie, and the majority fall headlong into them. Mrs. Forrester has fallen into a rather deep pitfall in *Mignon*, where she has massed together an amount of psychological improbability which gives a curiously unreal air to the story. There are three heroines, or "first walking ladies," in this novel, with their three first walking gentlemen to correspond, as well as the inevitable pair of subordinates, kept well in shadow and of no vital use in the narrative. And of these six more prominent personages one is as unlikely as another, men and women equally failing to convince us of their possible existence outside the covers of Mrs. Forrester's book. Take *Mignon*, as the heroine *par excellence*, seeing that she gives her name to the story and is also of more importance than the rest. Her character and individuality may be summed up in a word—she is beautiful. But, after all, here is only that *beauté du diable* which depends on the rounded lines and brilliant colouring of youth. When she first appears she is "sitting on the topmost rail of a five-barred gate," with a young boy of eighteen or nineteen kneeling at her feet, and another, her twin-brother, leaning against the tree. "Her hat has fallen off, and her golden hair is all smitten through with the broad sunbeams that glim between the sparsely-covered branches of an ancient oak." She has what is sometimes called a "rippling laugh," but which, when more fully described, seems as if it must have been rather more than a ripple; for when a girl "throws herself back and laughs à gorge

* *Mignon*. By Mrs. Forrester, Author of "Diana Carow," "My Hero," &c. 3 vols. London: Hurst & Blackett. 1877.

déployée—when “her lovely mouth uncurls as wide as it could, which was not very wide,” and “you could count all her lovely pearls of teeth,” it is a little tax on one’s imagination to believe that “the sound of her mirth was like water rippling over little stones.” We have heard women laugh before now à *gorge déployée*, and with all their lovely pearls of teeth shown so that they could be counted; but the result was by no means a ripple, and could scarcely be called musical. We will give the second sitting, when Sir Tristram Bergholt is converted from a man of sense to a dotting idiot, and from a man of honour to a coward and a craven:—

Mignon trips from tree to tree robbing each with ruthless hand of its fairest children; crimson, blush and golden, snow white and rosy pink are pressed together in the firm grasp of her small lithe fingers, and Sir Tristram follows, watching her every movement and drinking in her perfections in charmed silence. Nature was in a happy mood he thinks when she dowered this god child with so lavish a hand. As she stands on tiptoe to reach a crimson blossom, Sir Tristram instead of gallantly bringing his superior height to the rescue is taking the opportunity to look at her feet.

There is a certain noble lord (with whom in this matter my ideas are perfectly *d'accord*) who refuses to pronounce a woman beautiful until he has seen her eat. Sir Tristram never gives his verdict upon one until he has seen her feet. The momentary glance afforded him, satisfies his critical eye. Mignon’s feet are encased, it is true, in shabby slippers, but they are small and well formed. And upwards to her shapely hands, her creamy throat, her dimpled mouth, the exquisite upper lip and dainty nose, the long lashed eyes and white brow whence springs an aureole of ruddy golden hair, there is not one point the ravished beholder would wish more perfect. A strange desire seizes him to add to all that nature has done, the graces of art; he is not a believer in “beauty unadorned:” he would like it to be his task to put dainty slippers on the little feet, rare stuffs and samites on the shapely form, to crown the golden locks with pearls and diamonds.

When this has been said of Mignon all has been said by way of commendation. Beyond her beauty she has not the faintest shadow of charm. She is greedy, “mild,” ungrateful, selfish; a “cold” but audacious and dishonourable flirt, without one principle of action save self-interest; insolent, ill-tempered, rude, and atrociously vulgar. Yet she can make not only a good pure-minded boy, like Oswald Carey, madly in love with her, for all that he has known her ever since they were children, and has been the perpetual butt of her ridicule and victim of her ill temper; but she can also keep the passionate devotion of an honest gentleman like Sir Tristram, whom as her husband she has insulted and gone near to dishonour; and can keep at arm’s length a professed seducer like Raymond L’Estrange. She tells her husband on the day of her marriage that she hates him, that she has married him only for the sake of her twin brother, and that she can never like him, because he is “more than old enough to be her father” (she is seventeen and he is forty-six); she treats him with vulgar insolence and abuse, flirts before his face and in the eyes of the world till she is almost cut in the county, and shows herself thoroughly bad and heartless all through; but with all this Sir Tristram, who is meant to be a manly, noble kind of person, is so besotted by her hair and her eyes, her youth and her beauty, that he condones and allows anything rather than run the risk of offending her by rebuke or angering her by restraint. She is a child and he is a man of the world; but she rules him and herself to their joint disaster, and in a way which no worthy man who understood his duty could possibly allow. When she is disgraced for life, even then he loves her with all or more than all his former passion; but the reader asks in wonder why? It is a love akin to a miracle—something made out of nothing. Love must be founded on something lovable; and when the beauty which has been Sir Tristram’s lure has gone, nothing remains but a heartless and worthless woman with one side of her face smashed in and the other left as before. Again, her conversion after her disgracement is also of the nature of a miracle. She has hitherto given no sign of any quality whereby a noble woman could be evolved out of an unprincipled one. She loves her twin brother Gerald, and he is the only being in the world whom she does love; but in all other respects she is thoroughly ill-tempered and selfish. Where, then, are the elements out of which a good, affectionate, patient, and resigned woman could be made? The loss of beauty does not create a nobility of nature which did not exist before; though it may, by destroying the occasion of vanity, allow what did exist and was hidden to come to the surface. Yet the author has made Mignon suddenly jump into goodness out of villainess, simply because she has lost her beauty and one side of her face is scarred and hideous.

Kitty Fox, again, is a character that does not ring true. Her introduction is in this wise:—

“Not Kitty—not Miss Fox!” ejaculates Sir Tristram.

“Yes, Kitty Fox.”

“By Jove!” he cries with a glance of mingled admiration and affection at the gold-framed, cherub face upturned to him.

It only wants one glance to see that this is the most arch, mischievous, impertinent little sprite in the world.

“And last time I saw you,” continues Sir Tristram, “I rescued you and yards of torn frock from an apple tree whilst your poor governess stood bathed in tears at the foot.”

“Yes, by Jove, it’s me!” she retorts with glee, “and I’m out. I’m seventeen and three quarters; I was presented this season and I’m going to get married before it’s over. I don’t mean to remain a drag in the market. I can tell you.”

“Pray,” asked Sir Tristram laughing, “is it any use my putting in a claim? But I suppose you think I’m old enough to be your grandfather?”

“Oh no, I won’t have you,” she says, her eyes dancing with fun, “you are too nice and I mean to bully my husband. It’s so vulgar to be fond of each other now-a-days. And I’m not going to marry Raymond, though you did find us in such suspicious proximity just now,—he has the most awful temper, and we should lead a cat-and-dog life.”

“How should I suit you, Miss Kitty?” inquires Sir Conyngham.

“Very well indeed as far as not caring for you goes,” retorts the impatient minx, “but you haven’t enough money.”

Out of this rather unpromising material we find developed at hot speed the model wife of a middle-aged, lumbering, uninteresting kind of man, the devoted mother of a couple of “cherubs,” and the most proper little matron in the world, for all that she is fond of peaching herself on the table and saying saucy things to her husband. But, just as it is impossible for an artist to paint a rainbow, so is it impossible for a novelist to give such a character as Kitty Fox with anything like verisimilitude or refinement. We get no other impression of what of a pert chambermaid or one of her two modern antitypes—a barmaid at a railway station or a girl in a cigar shop.

Olga Stratheden is no more real than the rest. She is twenty-nine years of age, and a widow, who had married a dying man out of compassion; but she pretends to act like a woman of fifty, and to give herself quasi-maternal airs to men of three-and-twenty, which are utterly incompatible with the theory of her sincerity. When the young fellow whom she had nursed in an illness falls in love with her, and tells her so, she calls herself an “old woman,” and refuses to marry him because of the six years that stand between them; notwithstanding she loved him passionately, and finds her life wrecked without him. Things, however, come right after Leo Vyner, the young lover in question, goes abroad and grows a beard; but such a woman as Mrs. Stratheden would either not have made the delay and opposed the obstacle that she did, or, having done so in the beginning, would have stood by her decision to the end. The character reads like a bit of patchwork all through, the qualities of forty or forty-five being given to the comparative youthfulness of twenty-nine, and the result a strange mass of inharmoniousness and pretence.

Of Sir Tristram we have already spoken, and of Mr. Raymond L’Estrange—the one an honourable gentleman reduced by love to dishonour and willing shame, the other a selfish and systematic Don Juan who allows himself to be played with and defeated by a woman for whom he has only the grossest kind of passion. Whether it was worth while to go so very near the edge for the pleasure of the perilous balance is a matter for the author and the reading public to settle between them. For ourselves we do not believe in the possibility of the situation, nor, we imagine, does the author herself. If *Mignon* is scarcely satisfactory in its drawing, it is not more so in its style. All the men quote poetry—as ordinary English gentlemen never do—and the women use expletives, and say “By Jove.” Mignon “does not take a palmy (*sic*) view of her marriage”; “this time last year she was a little rustic in a cotton gown and straw hat, lying on the daisied grass under a big tree, ambitioning (*sic*) nothing more than the undivided possession of her neighbour’s strawberries”; “it is quite right for youth and beauty to arrogate (*sic*) itself”; “now she is by way of flinging his money out of window with both hands”; “Fred’s defalcation,” is the equivalent for Fred’s non-appearance; and “it depends on whom the smoker is”—these are phrases which pass with the writer for good English, such as cultivated people habitually use. For the rest we have the superiority of men to dogs sarcastically queried; Mr. Swinburne in one page is quoted with the following *che peccato*:—“So sings our grandest poet of to-day. What a pity that with his transcendent genius, his divine gift, he has used it so that, if one quotes his exquisite lines, one hesitates to name their author!” But eight pages off he is mentioned without this reservation, openly and not behind the fan; and there is the mixing up of religious texts and moral twaddle with suggestions and scenes where the world, the flesh, and the devil reign supreme. On the whole, *Mignon* is a book for which we can express neither esteem nor admiration. What there is in it of ability is misapplied in direction, and in spite of its redeeming texts the tone of it is bad.

RUSSELL’S DIARY IN INDIA.*

ALTHOUGH there was at one time perhaps rather a tendency to exaggeration in regard to the character and effects of the Prince’s visit to India, there can be no doubt that it was, in its way, an important and interesting event, and worthy of being chronicled in a permanent form. A great deal has, of course, already been written on the subject, and Dr. Russell comes rather late into the field; but it should be taken into account that his attendance on the Prince as private secretary provided him with opportunities of close observation and of obtaining accurate information which give a special value to his narrative. On the other hand, however, the author seems to have been exposed to some difficulties and disadvantages arising from the conditions of his task. In the first place, his connexion with the suite imparts a certain official appearance to his work; and although, as he states in a prefatory note, he has recorded only his own impressions and opinions, and is therefore alone responsible for the views expressed on questions of policy, government, or other matters, it would appear that the atmosphere around him has led him to write rather as a courtier in waiting, bound to be always beaming with admiration and delight,

* *The Prince of Wales’s Tour: a Diary in India.* By William Howard Russell. With illustrations by Sydney P. Hall. London: Sampson Low & Co.

than as an independent and critical observer. Another plea is that the Prince of Wales is "the central figure around which all the things, persons, and events mentioned in the Diary revolve," "so that, if his name and title occur repeatedly in the same page, it is necessary, from the nature of the work, that they should do so"; but it may be thought that this aspect of the subject is rather overdone, and there is certainly something wearisome, after the first, in the iteration of the monotonous incidents of formal receptions and stereotyped ceremonies. These were of course an essential element in the Prince's round of duties; but the book would certainly have been more readable if it had dealt rather with the instructive lessons of the journey than with its trivial and tiresome adjuncts. The writer also occupies a great deal of space with an introduction in which he enters into a laborious argument to show that the expedition was justified by substantial reasons, a point on which no sensible person ever had any doubt.

It is unnecessary to recapitulate in detail the circumstances of such a well-known story, and it will be enough to give a general glance at particular incidents. Dr. Russell is able, from the position he held in the Prince's suite, to give some glimpses of the inner life of the party on board the *Serapis* and elsewhere. The pomp and state which attended the movements of the Prince were of course peculiar to his rank; but, apart from this, the members of the party appear to have travelled in much the same way, and gone through much the same experiences, as other travellers with ample means. On the *Serapis* there was deck tennis, varied by pistol-firing at marks hung up at the yard-arms. A theatre had also been set up, in which plays and nigger serenades were performed by the bandmen, sailors, and marines. One ditty called "Optional Cocoa," composed and sung by a big handsome sailor named Sly, about his experience on board a ship of the Channel Squadron, where, by the admiral's orders, it was "optional" for the crew to have a cup of cocoa or something more stimulating, was always received with great enthusiasm. Captain Glynn acted as Lord Chamberlain's reader of plays and dramatic censor; but the melodious captain of the fore-castle just mentioned sometimes, under cover of an encore, slipped in an impromptu which caused immense delight to the pit and gallery. The entertainments also included clog dances, hornpipes, sentimental ditties, and "regular fore-bitters." Among other means of passing the time pleasantly were books, including light and heavy literature; chess and backgammon boards, which, however, were seldom used; pistol practice, quoits, and ball; inspection of the horses and animals; visits to the bridge and ward-rooms; and "last, not least, the never-failing solace of a siesta in one's cabin." Then there were, even in the hottest times, gymnastic performances about tubbing time, in which "Dr. Fayer, armed with two mugsdals or Indian clubs, whirled them round his head with an air of entire resignation and devotion, and Canon Duckworth gave demonstration that he was no bad representative of the school of muscular Christians." Sometimes the Prince took a "cruise" between decks before breakfast, and visited the cabins to see how his friends were getting on. For the sake of a sensation the stokehole was visited by the Prince, the Duke of Sutherland leading the way, and the party of course returning in a dripping state. All the time Dr., now Sir Joseph, Fayer kept a sharp watch on the health of the party, giving orders, on the eve of entering the Suez Canal, that the too generous energy of the French chef should be restrained, and the number of hot dishes at breakfast reduced to two; that attendance at lunch should be left to personal discretion, and that three courses at least should be struck off the dinner menu. Later on in the voyage he had hard work in attending to various cases of "heat exhaustion," for which he prescribed ice and brandy-and-water, apparently without provoking any protest from the patients.

One of the principal excitements of the voyage seems to have been the freaks of the *Serapis*, a vessel specially selected by the Admiralty for the service of the Heir-Apparent. From the first she primed badly, and she also suffered every now and then from hot bearings. At Athens the chain cables of the starboard and larboard anchors snapped in succession; and, as the steam had been blown off the boilers, there was an imminent risk either that the *Serapis* would "destroy the whole Greek fleet at one blow," and run aground, or "would be impaled on the spur of one of our own ironclads." Happily, such a disaster was prevented by the efforts of neighbouring vessels. Again, after leaving Aden the ship suddenly stopped, and it was found that a condensing pipe was out of order on account of its soft metal stuffing having melted, so that the water was going into the stokeholes. Next day there was another stoppage of the engine, on account of the cover of the bilge-pump of the main engine having become disorganized. On November 5 we are told that the steaming had been found too much for the engines, and "a thorough overhaul is needed, and will be executed at Bombay."

Before the Prince was visited by the Viceroy of Bombay there had been a notion that the meeting might be attended by difficulties as to relative position and precedence, not indeed in rank, but in State ceremonial before the world; but fortunately such anticipations were not fulfilled, for the Prince and Lord Northbrook perfectly understood what was due to themselves and each other. There was also a question between the authorities by sea and land as to the salutes to be given when the *Serapis* and consorts arrived, the naval commander-in-chief at Bombay having declared that, in order to show how far below the Prince of Wales everybody else was, he could not salute the Viceroy or Governor when once the Royal Standard was flying in the harbour; happily this

difficulty, too, was amicably adjusted, and everybody had their rights in the way of blank fire. It was further a serious problem how the Prince should make his first appearance before the Queen's subjects in India. By some of the authorities it was held that he must ride on a gorgeously caparisoned elephant, and the animals were all got ready; but it was finally resolved not to employ them. As alternatives, there was a choice between horseback and a carriage; and the former would have been very picturesque and effective, but it was overruled on account of the dangers of a ride of six or seven miles or more through a line of illuminations, and the decision was in favour of carriages. When the Prince went on shore, "the anxiety of the chiefs to see him," we are told, "was almost painful; for once they were much agitated, and the proudest departed from the cover of their habitual reserve." Those who saw the Prince as he landed thought he looked "serious, and even sad of aspect," but there was a difference of opinion as to how far this was due to the heat or to emotion.

It was at first announced that the Prince could not hold "Durbars," but there was really very little difference between these and the private visits, except that the chiefs were introduced separately and had separate audiences, and thus certain grave questions connected with precedence were evaded. The essential carpet, however, was there—a crimson cloth with gold-lace borders, and the emblazonment of the royal arms and motto in full—the place allotted on the edge of which was the measure of the degree of consideration and honour assigned to the visitors. The Rajah of Kolhapoor, a child of twelve years old, was the first of the native dignitaries received by the Prince, who met him at the appointed distance, and took his hand with a pleasant smile, while the Political Agent conducted him to a chair on the Prince's right. Then came the Sirders, salamaning low, who presented to the Prince a kerchief containing gold mohurs. This the Prince touched with his right hand and handed back. Next all rose, and the Prince, being supplied with a gold and jewelled scent-bottle, shook a few drops from it on the Rajah's handkerchief, and then from another rich casket took out the betel-nut, wrapped in fresh green leaf covered with gold-foil, and placed it in the Rajah's hand. The other durbars were received in a similar manner at different distances from the throne. The principal chiefs were escorted by the Royal suite from the threshold of the audience-chamber; but those of lower rank were not accorded this favour. At the levees some of the native gentlemen appeared so utterly astonished and unhinged as to lose all power of locomotion; so that it was necessary to seduce them gently away from the Royal presence, or occasionally, indeed, to direct their uncertain steps with more vigour than politeness. As for the poor Prince, he had to stand for more than an hour in a boiling temperature, and make at least two thousand bows. On the whole, it would seem that the intercourse between the Prince and the chiefs was pleasantly conducted, and the jealous irritation which, it was feared, might break out on the part of those who thought they were not treated with sufficient distinction was kept within bounds.

The sporting experiences of the Royal party necessarily occupy a large space, and are rather monotonous, though they include some striking incidents. The hunters were sorely punished by flies, leeches, rats, and other vermin, and did not escape without some perilous encounters and broken bones. A tiger sprang on the elephant of the Rev. Julian Robinson, placing one paw on his rifle, so that he could not fire, and tearing the mahout's leg. The elephant swung round, the tiger fell off, but sprang at the elephant again, and clawed it cruelly. It then leaped on the mahout of the elephant carrying Colonel Ellis, and was tearing him down, when the Colonel fired at it and brought it down, but not till it had lacerated the elephant's ear and the man's knee and leg. The Prince was also furiously pursued by a wild elephant which kept within not many yards of him for a second or two, and forced him to put his Arab horse to the utmost gallop. There were some disappointments in regard to some of the sports, as, for instance, with the cheetahs and elephants; but the Prince seems to have had plenty of tiger-killing. On one occasion seven tigers fell, of which six were shot by him. Pig-sticking occupies a high place in the roll of casualty-causing sports, as the following list shows:—Lord Carrington, a broken collar-bone; Lord C. Rossford, teeth broken; Lord Sulfield, injured by his own spear; not to speak of falls. The elephants, too, were rather frisky, and even such an experienced rider as Dr. Fayer was thrown off, while another elephant on which the Prince was riding gave him a liberal donche-bath from its trunk. A tiger also once sprang on the Prince's elephant, and tore the cloth, but was driven off.

On the whole, it may be said that Dr. Russell's Diary, although too limited and personal in its scope, is a handsome memorial, which is very suitable for a drawing-room table, and may be dipped into for the sake of occasional graphics and amusing descriptions. Some of the illustrations are very good, but they would have been better for weeding.

GERMAN LITERATURE.

THE great edition of Schiller's works*, under the direction of Karl Goedeke, is at length completed by the publication of a

* Schiller's *Sämmtliche Schriften. Historisch-kritische Ausgabe.* Herausgegeben von Karl Goedeke. Th. 15. Stuttgart: Cotta. London: Siegle.

fifteenth volume in two parts, comprising the fragments of the author, his revisions of Goethe's *Egmont*, Lessing's *Nathan*, and the first and fifth acts of *Othello* for the stage, and his voluminous studies for his unfinished tragedy of *Demetrius*. The first part contains the dramatic fragments and outlines of projected plays, all or most of which had already been published by Madame von Gleichen-Russwurm, together with such curiosities as Schiller's Chinese tale and his juvenile medical thesis "de discrimine febrium inflammatoriarum et putridarum." The adaptations of standard dramas for the stage in the second volume exhibit few additions from Schiller's own hand, but extensive retrenchments. Half of this volume is occupied by *Demetrius*, the preliminary studies for it, and the plans and notes for its continuation. These are of the highest interest as showing Schiller's method of work and his extraordinary industry, and justifying the belief that *Demetrius*, had it been completed, would have ranked second to none among his tragedies.

L. Herwarth von Bittenfeld *, a relative, we may assume, of the distinguished officer of the name, publishes some lively and not uninteresting reminiscences of his personal experiences during the late war. They relate to the siege of Strasburg, the investment of Paris, the campaign on the Loire, and the ultimate occupation of the French metropolis. They have more to do with the relations of the invaders and the conquered people than with actual operations in the field, and are in general characterized by a becoming spirit and exemplary generosity of feeling. The author speaks highly of Gambetta, and fully recognizes the great moral effect of his gigantic, though ineffectual, exertions for the relief of Paris.

Dr. Schenkel † may be accepted on the whole as the representative of liberal Protestantism, and his manual of Christian doctrine affords a fair measure of the degree in which Rationalism has been modified by the severe criticism it has undergone at once from the reactionary and the freethinking schools of religious opinion. The effect may be discerned, on the one hand, in a more fervid and genial style of thought and expression; on the other, in the abandonment of the old forced explanations. Something of the former spirit remains, as when Dr. Schenkel, having given up the miraculous in every practical or intelligible sense, gravely observes that, after all, the really vital and edifying part of the doctrine is the admission that the ultimate ground of things is incomprehensible.

The recent additions to the excellent series of pamphlets on the questions of the day, edited by Franz von Holtzendorff ‡, comprise several discussions of topics of pressing interest. Among these may be named Dr. Georg Kauffmann's account of the contest between French and German education in Alsace-Lorraine, Dr. Kirchner's tract on the reform of the national system of religious instruction in Prussia, and Professor Cohn's on the still more important question of the general rise in prices. More generally interesting still, perhaps, are a series of letters from Turkey signed "Obaricles." To the companion series of popular lectures, edited by Holtzendorff and Virchow, have been added discourses on Goethe's relations with his native city of Frankfurt, on his establishment in Weimar, on Lessing's *Nathan der Weise*, the condition of women according to ancient German law, the aborigines of Celebes, and many other interesting themes.

It is not very easy to promulgate a new ethical system at this time of day; nor is there anything very novel, or, except perhaps for people so innately reasonable as not to require ethical systems at all, anything particularly satisfactory in Herr Landau's § discovery that virtue consists in the regulation of the appetites and affections by means of reason. The novelty, if any, must lie in the practical operation of this principle, which is to be developed in a succeeding part.

There is more originality in a parallel between Adam Smith and Kant by Dr. August Oncken ||, designed to show that the founder of political economy has been misunderstood owing to the comparative neglect of his *Theory of Moral Sentiments*, a work intimately connected in design with the *Wealth of Nations*. According to Dr. Oncken, Kant and Smith in a manner complete each other, Kant contributing the scientific proof of the principles which Smith applied empirically, and Smith exemplifying the practical application of Kant's philosophy in the departments of politics and economics. He insists that Smith has been greatly misconceived when regarded as the apostle of absolute *laissez faire*, and shows that he accorded ample scope to State regulation and control in various matters.

The memory of J. H. Campe ¶ survives as that of a pioneer in educational reform, and a successful writer for the young of his

own and more than one succeeding generation. In both capacities he is entitled to a biography; and it is instructive to contrast him in the former with the types of practical pedagogy in our own day. If, in comparison with the representatives of our more lax and genial discipline, this apostle of German *Aufklärung* appears somewhat dry and unimaginative, and too exclusively rational and utilitarian, it is, on the other hand, impossible to refuse admiration to his manly independence and good sense, his faith in human nature, and his disinterested benevolence. In philanthropy, if in nothing else, Campe was an enthusiast; and the merits and defects of an era ardent in the cause of prose are fairly personified in him. Much of his success, no doubt, sprang from his personal influence, which his animated and intelligent physiognomy helps to explain. As a writer for the young, he belongs to the category of the English Aikins and Barbauds, but scarcely stands so high. His most successful work is his "Robinson the Younger," which, in the biographer's opinion, compares favourably with Defoe. It need hardly be said that *Robinson Crusoe* was not designed as a book for boys; even from this restricted point of view, however, the imitation appears deficient in narrative skill, vivacity, and imaginative truth, while it is most inartistically interrupted by conversational interpolations of the "Tutor, George, and Harry" pattern. Campe corresponded with Lessing, Wieland, and others among the eminent men of his period; but their letters, here collected in an appendix, are in general too occasional and inconsecutive to be highly interesting. The most continuous are from Wilhelm von Humboldt, whose tutor in infancy Campe had been.

Franz Deák * was a patriot after the English model, the beau ideal of the type of statesmanship represented by those who, from the times of Simon de Montfort downwards, have based popular liberties on historical precedent rather than on abstract right. This type, indeed, is hardly possible except in the few countries like England and Hungary where freedom has never been entirely subverted, and historical continuity never wholly interrupted. This circumstance, no less than the brilliant success of his policy, renders him a personage of especial interest to Englishmen; it is only to be regretted that the peculiarities of Hungarian politics interpose a hindrance to the full appreciation of his character, which M. Csengery contributes little to remove. This is no discredit to the author, whose work, a political narrative, almost wholly destitute of the element of personal portraiture, was originally intended for his own countrymen, and who justifiably takes for granted an intimate acquaintance with the national politics. Fuller details and more complete explanations are required for the guidance of the foreign reader, who will carry away little except that general impression of Deák's magnanimity, disinterestedness, moderation, and political tact which he probably had already formed.

All will admit that the lives of great musicians ought to be written, but all will acknowledge the difficulty, and in general the unsatisfactory issue, of the undertaking. Few among the composers whose importance absolutely entitles them to a record have undergone the romantic vicissitudes of a Weber, or bequeathed the delightful correspondence of a Mendelssohn. Both of these might have been anticipated in the case of Chopin †, the very impersonation of the infelicity of over-sensitive genius. Scarcely a vestige, unfortunately, remains of the most interesting part of his career—his residence in France. An extensive correspondence, it appears, was extant until 1863, when, with the other effects of Chopin's family, it perished in a bonfire kindled by Russian soldiers. The composer's biographer depicts this as an ineffable loss; as regards his undertaking this is no doubt the case, but we must say that the high character he bestows on the correspondence which he has printed rather impairs our confidence in his judgment. The letters, principally addressed to an intimate friend, and terminating with the year 1831, deserve no such commendation. They treat almost exclusively of personal or musical matters, and, beyond attesting a certain sensitiveness and mobility of temperament, vouchsafe us few glimpses of the writer's inmost soul. It is true that they were written in Polish, and doubtless suffer greatly from the awkwardness of the German version. The same defect operates to the detriment of the entire work. M. Karasowski writes German grammatically, but with a constraint which renders him more bald and disjointed than he otherwise might have been. He labours throughout under the disadvantage of insufficient material; his actual information is beaten out very thin; and for the most interesting episode of Chopin's life, his *liaison* with George Sand, he has nothing to rely upon but the merest secondhand gossip. He renders Chopin's memory a service, however, by showing that he did not, as has been stated, forsake his betrothed for the brilliant authoress, but was forsaken by the former. It may be added that M. Karasowski writes throughout in an excellent spirit; that he has filled up a gap in biographical literature as well as his resources allowed; that, if his memoir had no other merit, he would deserve well of letters for thoroughly extinguishing the worthless rhapsody in the guise of biography which discredits the name of Liszt, and that the technical portion of his book seems calculated to be very useful. A full catalogue of Chopin's works is appended to his

second volume. With all the inevitable shortcomings of his work, it is one indispensable to the student of musical history.

Custom cannot stale Ludwig Nohl's infinite variety upon the theme of Beethoven.* His last contribution to it contains no original matter beyond an almost fulsome dedication to Herr Wagner, but consists of a series of forty-five personal notices of Beethoven from the pens of various contemporaries, with introductions explaining the circumstances under which they were written. They are of course of the most dissimilar degrees of value; all, or nearly all, however, merit preservation; and, taken altogether, they form an interesting and attractive book. One, an account of the composer's last moments by his friend Anselm Hüttenbrenner, seems to have hitherto only appeared in an Austrian newspaper.

The second part of Groddeck and Henne Am Rhyn's work on the internal laws and regulations of Freemasonry † is wholly from the pen of the latter writer, except for an historical introduction by Dr. Merzdorf. The latter possesses considerable interest even for general readers. Brother Henne Am Rhyn's share of the volume consists of a digest of the institutes of the Masonic body all over the world, ample, yet condensed, and apparently calculated to be of much utility to its members.

Dr. Kussmaul's ‡ work on the pathology of the organs of articulation treats both of the phenomena of aphasia, illustrated by a selection from the strange and suggestive cases which medical records furnish in such abundance, and of the more ordinary afflictions of deafness and dumbness, with an inquiry into the comparative merits of the French and German systems for the education of deaf mutes.

Dr. Hostinsky's § essay on the æsthetics of music is in the main a criticism of the theories of Hanslick and Wagner, both of which are rejected.

Two new novels by writers of reputation, Felix Dahn || and Karl Gutzkow ¶ are remarkable, in a literary point of view, for an obvious effort to relieve the proverbial heaviness of the German novel and to copy the animation and movement of the French. Herr Dahn seeks to attain this end by rapid dialogue and short sentences, Herr Gutzkow mainly by a liberal employment of notes of exclamation. The former is the more excellent way, and Herr Dahn is also fortunate in his subject, a delineation of the conflict of the Byzantines and Goths for the possession of Italy after the downfall of the Western Empire. This enables him to crowd his book with picturesque figures and stirring incidents. Herr Gutzkow, on the other hand, depicts ordinary society in the ordinary style of the novelists whose aim is a compromise between romance and matter of fact.

"Lost and Won" ** is a pretty and lively story, by a writer who appears exceedingly well acquainted both with English manners and customs, and with the topography of London. It begins in the British Museum, and ends near the Albert Memorial, which presents itself to the writer's mind in perhaps the most satisfactory light in which it is capable of being considered—a token of good feeling between England and Germany.

A catechism of dramaturgy, by R. Pröls ††, is fortunately not drawn up in the form of a catechism. More than half of it is devoted to a condensed historical sketch of the drama of all nations, very fairly executed; and the didactic portion seems calculated to be useful to dramatic aspirants of all descriptions.

The mediæval Latin poems collected by Herr Hagen ‡‡ from sundry Swiss libraries constitute a singular medley, comprising Leonine verses in the most barbarous style along with others which, as the editor remarks, rather savour of expiring classicism than of the spirit of the middle age. The subjects of the poems are generally theological, and their intrinsic value very small. The most interesting is a highly ingenious poem on chess, from which we learn that in the middle ages the queen had only the same power as the bishop now, and that the bishop's move was restricted to two squares.

The "vanished and forgotten one" whose verses are professedly edited by Georg von Oertzen §§ is not inapt either at the sentimental or the sententious strains of which his ample volume principally consists; it is nevertheless improbable that its publication will lead to any general demand for his restoration to society.

The April number of the *Rundschau** has an article on the Prince Consort's life by F. H. Geffcken, couched, like so many English essays on the same theme, in the strain of monotonous eulogy which inevitably reminds the English reader of Guinevere's criticism on the faultless Arthur. Zeller's paper on the light in which Christianity appeared to the Greeks and Romans is very elegantly written, but inevitably devoid of novelty. Elegance, too, is the leading characteristic of Emanuel Geibel's graceful little dramatic proverb. Some chapters from General Braudt's memoirs, relating to Prussian politics in the anarchical year 1848, convey graphic portraits of the forgotten celebrities of an epoch which no Prussian of any political party finds pleasure in remembering. Perhaps the most interesting contribution, however, is a dissertation by Virchow on the rudimentary stages of cookery, in which he shows how completely pottery, without which refinement in cookery is impossible, is a feminine art among savages, and how nicely the progress of barbarous man in the culinary art is adjusted to the condition of his womankind. An utterly degraded condition of woman is incompatible with pottery; lack of pottery means lack of cookery; and, wanting cookery, man wants the first step of the ladder that lifts him out of barbarism.

The *Russian Review*† is chiefly filled with economics and statistics, but contains one most edifying and entertaining paper on the wolf question in Russia. The lupine population of the Empire, it seems, is estimated at two hundred thousand, maintained at an annual expense to the public of fifteen million rubles at the least. The author of a book on the subject advocates a grand national effort to poison them off at the rate of ten rubles a head, and combats at length sundry objections to his proposal, one being the British one of the impossibility of laying poison for wolves without jeopardy to foxes. This public-spirited projector is an apothecary.

THE SATURDAY REVIEW

POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 1,121, APRIL 21, 1877:

The Salford Election. The Coming War.
The Budget. Russia and the United Greeks.
France and Religion. The Railway Commission.
How to Waste Public Time. Factory and Workshop Legislation.
Mr. Cross and the Titchborne Deputation.

The Victorious City.
Plague of Circulars. The Next Conclave.
The Society for the Protection of Ancient Buildings. Personal Intelligence.
Jamaica Planters. Opera Libretti. A Vision of Steam Tramways.
Population and Wealth in France. The Theatres.

The Sicilian Anarchy.
Shute's Discourse on Truth. The Raja of Sarawak.
Arnold's Last Essays on Church and Religion. The Holbein Society.
Luard's Relations between England and Rome. Mignon. Russell's Diary in India.
German Literature.

CONTENTS OF No. 1,120, APRIL 14, 1877:

The Crisis—The Budget—Prince Bismarck—The Irish Obstructives—French Tariffs and English Trade—America—The Election at Bordeaux—Gas and Water Legislation—What the Navy is Coming to.
The Confessions of Mr. Ruskin—The Lakes in Spring—The Archbishop on his Defence—The French Army—Religious Theatricals—A Lively Wednesday—A Cardinal on Roman History—The Government and the Cattle Plague—Paris at Easter—The Depression in the Iron Trade.
Gulliver's World—Comets—Diana, Lady Lytle—Africa and the Brussels Conference—Be Dine Dege—Roeve's Journal of a Residence at Vienna and Berlin—Religious Societies of the Commonwealth—My Year in an Indian Fort—Half-Hours among some English Antiquities—Minor Notices.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

MUSICAL UNION.—Tuesday, May 1.—Programme: Quartets, Mozart and Beethoven; Trio, B. H. Rubinstein; with Papini, Lassero, and Breitter (Pupil of Rubinstein), last time this season. Tickets, 7s. 6d.; to be had of Lucas & Co., Olivier, Bond Street; and Austin. Members can pay at the entrance in Regent Street.—Director, Professor ELLA, Victoria Square.

THE WAR.

A DOUBT which had already become fainter and fainter has at length been finally dispelled. The Manifesto addressed by the Emperor ALEXANDER to the people and the army, and the Circular to foreign Powers, have been promptly followed by a declaration of war. It would not be worth while to examine in detail the arguments or statements of any of these documents. The language which Governments use on such occasions is purely conventional; and the authors of a long-prepared war can scarcely be accused of an intent to deceive when they formally profess to have been forced by the conduct of the enemy into an unwelcome struggle. The omission from the Circular of any professions of abstinence from conquest has been generally remarked as significant. It was perhaps as well to avoid a new attempt to deceive the world by declarations which, if they had been made, would probably have been falsified. The retention or abandonment of any province which may be occupied by the Russian armies will depend on the policy of other Powers, and more especially of Austria. The pretexts for war are probably selected for the purpose of conciliating support or tolerance in England. The protection of Turkish Christians from oppression may be regarded as a laudable object; and in this respect the Circular follows the precedent established by the Emperor NICHOLAS in 1853. Prince GORTCHAKOFF might perhaps have devised a more plausible excuse for immediate action than the refusal of the Turks to accept the Protocol. None of the Governments which acquiesced in the Protocol as a compromise intended to require the signature of the Porte. As soon as the illusory negotiations in London were completed, the Russian Government ceased to affect any peaceable intentions. The menacing language which was addressed to the Porte evidently indicated a determination to force a rupture; and there is no reason to suppose that any conduct which could have been adopted by the Porte, short of absolute submission, would have averted or postponed the conflict. It was perhaps impolitic to end a long series of professions of moderation by proceedings which have given just and general offence; but, when a great war is about to commence, the forms and ceremonies with which it may be announced have no real importance. It had for some months been difficult to believe either that the army had been set in motion except for the purpose of attacking Turkey, or that Russian diplomacy was exerting all its ingenuity to prepare a pretext for an appointment and an affront to Europe. The Emperor's conversation with Lord A. LORTUS, which was published by the English Government at the express request of Count SCHOUVALOFF, was eagerly welcomed by the anti-Turkish party in England as a conclusive proof of Russian moderation. Lord DEBY implied a certain scepticism in assuring the Russian AMBASSADOR that the Emperor's declarations were the more acceptable because the armaments of Russia had produced anxiety and suspicion. It is now certain that the Moscow speech, and not the conversation at Livadia, expressed the real intentions of the Russian Government.

In stating to the House of Lords that the Porte had acted on the conviction that war was inevitable, Lord DEBY probably implied his own agreement with the Turkish conclusions. It might indeed have been worth while to delay the invasion if the English Government could have been coaxed into hostile measures against Turkey. The opponents of the Government assert that its backwardness in supporting the oppressed

Christians has encouraged the aggressive policy of Russia. Measures of coercion would probably have been forcibly resisted; and when Turkey had been weakened by the attacks of a Power which would have been only half in earnest, Russia would have undertaken the completion of a task which would perhaps not have been perfectly accomplished. Recriminations between English parties are now probably at an end. The progress of the war will be watched with a solicitude in which sympathy for Russia will have little share. It is still said to be uncertain whether the Russian army will at once attempt the passage of the Danube, or halt on the Northern bank of the river in the hope of exhausting by delay the spirit and resources of the enemy; but a pause in the operations would be scarcely less burdensome to Russia than to Turkey, and hesitation might in popular judgment be attributed to fear. The declaration of war may be regarded as preparatory to an active campaign. When the Emperor NICHOLAS crossed the Pruth, he professed not to be engaged in actual hostilities; and the declaration of war was, after a delay of two or three months, published, not by the Russians, but by the Turks.

The Roumanian army, though it is not likely to take an active part in the struggle, has been raised to the highest attainable strength; and, according to one rumour, Prince CHARLES intends to proclaim his independence as soon as the conflict actually begins. It is more probable that he will wait for the general rearrangement of treaties which is likely to be a result of the war. Prince MILAN's assumption of the kingly title was never recognized by a European Power; and on the conclusion of peace with Turkey the pretension was tacitly abandoned. The condition of Roumania would not be practically affected by the abolition of a relation of dependence which has from the first been almost a fiction; but it is probable that nominal as well as real sovereignty would be acceptable to the population. The local Government is not to be blamed for allying itself with a Power which is, either as a friend or an enemy, about to occupy its territory with an irresistible force. Politicians who have recommended the establishment of a belt of petty States as a barrier between Russia and Turkey may learn a practical lesson from the present attitude of Roumania. In Serbia also, notwithstanding the peace which was concluded with the express sanction of Russia a few weeks ago, a warlike agitation has already recommenced. General FADAEFF is at Belgrade, assuredly not without the permission of his Government; and there can be little doubt that his immediate business is to secure the means of a diversion on the side of Serbia if it should be found useful in the conduct of the campaign. It scarcely seems prudent to employ in the neighbourhood of Austrian Croatia an agent who must be especially obnoxious to the Governments of Pesth and Vienna. The time has not yet come for the official adoption of the theory that conquests in Turkey imply the previous destruction of Austria.

If the summons of General RODICH to Vienna implies his dismissal from the government of Dalmatia, the appointment of a successor of different opinions would throw some light on Austrian policy. Although it may be doubted whether the Turkish Government would formally assent to a foreign occupation of Bosnia, no resistance would probably be offered to the entry of Austrian troops into the province. Such a measure would in truth relieve the Porte from many difficulties. An Austrian army of occupation would hold Montenegro in check, and it would set at liberty

the forces which are now employed in watching Bosnian malcontents. Servia also would be effectually checked on the western frontier, and Austria might perhaps think it prudent to enforce on Prince MILAN absolute neutrality. It is understood that the Russian Government would officially approve a movement which it could have no means of preventing. It would be easy to represent an Austrian occupation of Bosnia as an act of co-operation which might furnish an additional proof of the vitality of the Triple Alliance. It is nevertheless nearly certain that the Austrian Government has declined to promise either active aid or eventual neutrality. There is no risk of a collision as long as the Russian army is advancing to the Balkan; and operations which may be undertaken in Asiatic Turkey are beyond Austrian control. Recent transactions tend to confirm the proposition that the value of astute diplomacy is liable to be overrated by its practitioners. The long negotiations in which Russia has exhibited versatile ingenuity have ended as they began, by leaving the two principals in the dispute face to face. The assurance that England would not in present circumstances interfere in defence of Turkey might have been obtained without the use of any elaborate machinery of Conferences and Protocols. The Continental Powers from the first openly proclaimed their purpose of neutrality; and not one of the number has been persuaded to affect a direct approval of the long-meditated invasion of Turkey. The Protocol itself might as well have been expressed in unambiguous language, since it has ceased to be binding on England.

COUNT MOLTKE'S SPEECH.

EUROPE is now in such a state of feverish agitation that a speech from Count MOLTKE, made at the very moment when the troops of the CZAR were crossing the Pruth, was sure to create alarm. The excitement was naturally greatest at Paris; but, when it had become known what he had really said, the French had the good sense to recognize that they had no cause of complaint or suspicion. The German Parliament had been asked to sanction an increase of the military estimates sufficient for the pay of 122 more officers; and, as some opposition was made to the proposal, Count MOLTKE came forward to explain how it happened that these new officers were wanted in time of peace. In one way his task was very simple, as it was obvious that, if these officers were wanted for war, they must be trained during peace; and he was making a very safe appeal when he asked his hearers whether they were not perfectly aware that no German officer would ever be allowed, whether war or peace was reigning, to pass a single idle hour. But, having to say thus much, he went further, and offered some general comments on the relative military positions of France and Germany. The German army costs less than the French, and its system of organization is, he thinks, better; but, while Frenchmen of all parties are eager to grant everything which the military authorities ask for, Germans grumble over every additional mark spent on their army. This vexes the soul of the great captain, and he thinks his countrymen show some ingratitude and much want of foresight. The respective views of the French and the Germans seem, however, very rational in the different circumstances in which the two nations are placed. The French have to invent a military machinery which will restore them to their natural place among the Great Powers. The invention of such a machinery is expensive, and it is not surprising that the French, while engaged in the process, should spend six millions a year more than Germany spends in keeping in good working order a machinery which she has perfected with all the resources of military science. It must also be remembered that France is a richer country than Germany, and the richer the country the more its army will cost, as soldiers and officers expect more to be done for them; and the extra expenses entailed by the possession of Algeria must also be taken into account. In the same way, when Count MOLTKE criticizes the French system of keeping up numerous weak battalions, and assigns a superiority to the German system of keeping up fewer battalions at their full strength, it may be replied that in Germany a national army has been formed, while in France it is only being formed, and that, while the object of a nation is to have men taught to be soldiers, numerous battalions,

though weak, multiply centres of instruction. The French, too, naturally take great interest in their army, for they see in it the means of regaining their self-respect, and a great work that is being accomplished always awakens more sympathy than a great work that has been accomplished. Germany, on the other hand, has to concentrate its attention on not letting its army fall off in efficiency, and this is a process which awakens little enthusiasm; for ordinary people feel that what is needful is being done for them, and that they have no part in it, while the perpetual burden of the expense of the army is being always brought home to them by the pressure of heavy taxation.

Count MOLTKE spoke, as the Duke of WELLINGTON used often to speak, with that horror and detestation of war which comes from long experience of what war means, and which an acknowledged master of the art of war can afford to own. No advantage, no increase of prestige, no addition of territory is, he said with great earnestness, worth purchasing at the cost of a human life. The policy of Germany must be a strictly defensive one. France had so often fallen on divided Germany that she not unnaturally expected that united Germany would fall on her. For his part he entirely repudiated anything like the folly of going to war with France in order to gratify wanton purposes of ambition. It is true, he pointed out, that Germany is united; but even in united Germany there are alien and discordant elements. There are the Poles on the east and the Lorrainers on the west, who are only Germans in name, and these incongruous populations give far too much trouble for Germany to wish to have any more of them. It is often said that Germany hungers after Holland, after Denmark, and after the German provinces of Austria. At any rate Count MOLTKE does not hunger after them. He only wants Germany to be so strong that it will be left alone. It is true that he is more responsible than any one else for the exaction of the cession of Metz. But, whether he was right or wrong, he always declared that he insisted on Germany having Metz for no other reason than that its possession was absolutely necessary for the defence of Germany. If military reasons were to prevail, it may be remarked that Count MOLTKE's views are amply confirmed by the recent writer on the French army in *Blackwood*, who, while saying that it is now too late for Germany to attack France, states that the possession of Metz by Germany makes it almost hopeless for the French to think of attacking Germany. Never again will Paris sing *À Berlin* on the eve of a German war, as if marching to Berlin were as easy as marching to Milan or Madrid. To get men across the Rhine would now puzzle the most skilful French general and the bravest French army. Germany sleeps in an entrenched camp which, on the side of its old enemy, is guarded by the most elaborate defences. That it should have to sleep in a camp, and not in a smiling plain where thoughts of war might never enter, is to Count MOLTKE's eyes a sad necessity. But at least Germany can, if it is wise, take care that things shall not be worse than they need be, and may let all men know that it has no intention of sallying out of its stronghold like a mediæval noble out of his castle to plunder and terrify its neighbours.

Possibly it was not to be expected that Count MOLTKE should be quite just to France. He is the watchdog of Germany, and watchdogs are apt to bark even when their grounds for barking are not wholly satisfactory. He said that he could not believe in the pacific intentions of France, because he found that the French journals were full of hatred and spite against Germany. This was unjust. There are foolish journals in every country; but the French press as a whole has been singularly moderate and careful of giving offence whenever it seemed possible that the susceptibilities of Germany could be aroused. The criticisms passed on Count MOLTKE's own speech have been studiously sensible and fair. The French press waited until it was known what Count MOLTKE had really said; and then, instead of fastening on particular expressions which were certainly open to comment, looked at the speech as a whole, and recognized that its main intention was pacific. The Germans are really much more disagreeable to the French than the French are to the Germans. It was not the French who omitted to invite Germany to take part in the new Exhibition, but the Germans who refused, when asked, to have anything to do with it; and the French passed over the refusal in dignified silence. Count MOLTKE, too, when he

insists with eminent force and good sense on the wisdom of adhering strictly to a defensive policy, seems to have forgotten the celebrated Berlin scare which not long ago made Europe pass through a week of trembling. It may be presumed, from what he now says, that Count MOLTKE himself did not form part of the clique which nearly succeeded in getting up a war in order to punish France for presuming to think of once more existing as a military nation. But the danger was so great that Russia, and in a subordinate way England, had to intervene and save Germany from an act of indefensible bullying. The mass of the German people wish for nothing but to keep what they have got, and the lack of enthusiasm about their army which Count MOLTKE laments is partly to be attributed to the fact that the Germans are essentially a pacific people. There never perhaps was a nation of conquerors which cared so little for military glory. And men of the first order of intelligence in Germany like Count MOLTKE sympathize with the people on this head, and would be very well pleased to see Germany keep altogether aloof from war. But, if Count MOLTKE ignores the existence of a military clique in Germany, it is impossible that the French should shut their eyes to it. Whether France and Germany can go on for a long period of years, each satisfied with its own defensive strength and averse to projects of attack, is more than any one can say. It is in human nature that Frenchmen should sometimes think they would like the day to come when they could at least show the Germans that they were a match for them, even if they did not exactly march to Berlin. But Frenchmen also say to themselves that war is a terrible thing, and that the day of their dreams had better be put off indefinitely. It depends perhaps quite as much on Germany as on France whether a war in the near future shall be averted. If France could but be really persuaded that Germany thinks only of defence, much of the irritation and alarm which Germany excites in France would die away. But Germany, if it wishes for peace, may be wise not only to keep on the defensive, but not to keep on the defensive in a provocative way. Count MOLTKE hinted that, if the French continued to mass men on their frontier, Germany might have to do the same. The possession of Metz and Strasburg ought to save Germany from the supposed necessity of taking a step which would inevitably provoke much alarm and ill feeling. As the French have not got Metz and Strasburg, they have to think how, if they were attacked, they could cover Paris; and they must group their men where, for defensive purposes, they would be wanted. Count MOLTKE was perhaps inclined to be a little over-vigilant, and there was a demonstrativeness in his tone when speaking of precautions against France which gave his attitude a somewhat unpeaceful appearance. But he has since had an opportunity of recurring to the subject, and has explained what he said so as to make it as harmless as possible, and to indicate a determination to adhere to a strictly pacific policy.

THE HOME RULE DEBATE.

THE debate on the motion for a Home Rule Committee was creditable to all parties, and especially to the Liberal Opposition. The supporters of the motion were for the most part temperate and courteous; and their inability to explain their policy was the fault of the cause which they advocated rather than of themselves. The most satisfactory part of the debate was Mr. FORSTER's manly and powerful speech. Even if he had confined himself to a statement of his intentions, instead of also exposing the fallacy of the proposed measure, he would have done a great service both to his party and to the country. An impression had prevailed that, notwithstanding Lord HARTINGTON's spirited declaration of two years ago, some of the Liberal leaders were inclined to tamper with Home Rule, in the hope of maintaining the Irish alliance which has existed almost without an interval since the days of O'CONNELL. An invitation addressed by Mr. FORSTER himself to the Home Rule members to act with the Liberal party on neutral questions had been not unnaturally misconstrued; and Mr. GLADSTONE's announcement, made while he was in office, that he did not know the meaning of Home Rule, had not been literally interpreted. Mr. FORSTER, on behalf of the ex-Ministers, and Mr. FAWCETT, representing a section of extreme Liberals, have now formally repudiated all sym-

pathy with the measure which is sometimes embodied in a Bill, and which is on the present occasion implied in the motion for a Committee. Of the handful of English members who pledged themselves at their election to obey the behests of their Irish constituents, Sir WILFRID LAWSON alone undertook to defend his vote. It may be doubted whether his Irish friends will be grateful for his humorous description of the absurdity of their proposal. Mr. COWEN and Mr. JACOB BRIGHT were silent; and Mr. BUTT has probably by this time renounced the hope of bringing Home Rule within the sphere of practical controversy by gradual additions to the number of ostensible English converts.

Mr. FORSTER's remark that a great change in the Constitution could not be relegated to a Select Committee would alone have constituted a conclusive argument against the motion. Parliament cannot abdicate the unlimited power which has often been designated as omnipotence. An Imperial Parliament with other Parliaments exercising some of its former functions would be compelled on all occasions to consider whether it might not be transgressing its assigned limits. Mr. SHAW and the majority of his Irish supporters endeavoured to persuade the House that by voting for inquiry members would pledge themselves to nothing; and one or two Irish members even hinted their willingness to content themselves with something less than an independent local Parliament; but it was understood on all sides that the acceptance of the motion would have been an invaluable advantage to Mr. BUTT. The differences between Home Rule and Repeal have no interest for those who are determined to maintain the integrity of the United Kingdom. As one of the speakers happily observed, Mr. BUTT had proved that Repeal was absurd, and Mr. P. J. SMYTH had demonstrated the impossibility of Home Rule. The adoption of either project would result in separation, to be inevitably followed by compulsory reunion. The practical objections to either plan are, to an opponent of dismemberment, embarrassing by their number and their irresistible weight. It would evidently be impossible to maintain any restrictions which might be imposed on an Irish Parliament, for Imperial interference with Home Rule which had been lawfully established would be universally resented. It was pertinently mentioned in the course of the debate that the Dublin Corporation lately passed a resolution in favour of the restoration of the Pope's Italian dominions. A Parliament which would probably be accustomed to boast of its own sovereignty and independence would not abstain more scrupulously than a Town Council from interference with foreign affairs. It would be too much to hope that Mr. PARNELL or Mr. BIGGAR should pursue their favourite occupation of interrupting business in a domestic Parliament. As, according to Mr. BUTT's project, Ireland is still to be represented in the Imperial Parliament, Home Rule would afford Englishmen no protection against obstructive Irish patriotism.

Though it was impossible to be original in so hackneyed a controversy, Mr. FORSTER explained more forcibly than any previous Parliamentary speaker the anomalies and difficulties which would result from the change of the unwritten English Constitution into a new and artificial scheme of Confederation. Home Rule would introduce a conflict between Federal and State powers which would require a Supreme Court, as in the United States, to provide a peaceful solution. The House of Commons applauded Mr. FORSTER's inquiry whether any political party would consent to refer questions of constitutional right and of the division of power to any body of lawyers. If Englishmen would repudiate a newfangled experiment, Irish patriotism would treat the adverse decisions of a court of justice with profound contempt. The only defect in Mr. FORSTER's argument resulted from the necessity of the case, which required him to assume that Mr. BUTT's project was serious. Loyal Irishmen, such as Mr. BLENNERHASSET, may succeed in persuading themselves that Home Rule would be compatible with the supremacy of the Imperial Parliament; but the constituents who return fifty or sixty Home Rule members to the House of Commons have no intention of maintaining Imperial authority when they have achieved any kind of legislative independence. The speeches made at Home Rule meetings in Ireland are extremely unlike the mild and argumentative discourses which were delivered on Tuesday last in the House of Commons. The extermination or expulsion of the English intruder is represented by popular orators as the chief recommendation of Home Rule. Mr. BUTT himself has

never explained how he intends to create an Irish House of Lords, which would be unanimously hostile to the theory and practice of Home Rule. He has also pledged himself to measures of expropriation which no landowner would be likely to approve. In short, the motion for a Committee and the entire fabric of Home Rule have scarcely a closer connexion with real intentions and with practical policy than a Russian Protocol.

While Mr. FORSTER demolished the theory of Home Rule, Mr. FAWCETT grappled directly with a practical question which was still more interesting to the House of Commons, and especially to the Liberal party. The Salford election has probably put an end to the discreditable practice of buying Home Rule votes by ostensible concessions; but the indignation which has been universally expressed has provoked a threat which Mr. FAWCETT undertook to expose and to defy. A secretary of a Home Rule Club or League has announced that the Irish in large English towns will henceforth vote against the Liberals whenever their demand is refused. It would seem that, if Mr. O'DONNELL speaks with authority, his compatriots have reversed their political predilections since they unanimously supported the Liberal candidate at Manchester against the Conservatives, when both had with equal pliability conformed to their requisitions. Mr. FAWCETT answers the threat by declaring that he and his friends would rather pass their lives in a minority than give a hypocritical adhesion to doctrines which they abhor. For himself he declares that he would even support a Conservative Government which might be endangered by its opposition to Home Rule. If the Irish agitators act on their declarations, they may perhaps produce a result exactly opposite to that which they desire to accomplish. Nothing would restore the popularity of the Liberal party more certainly than a belief that they were the martyrs of their conscientious regard to the national unity. Mr. BUTT's followers have spoilt their own market by too cynical a use of their electoral influence. The Salford election will probably produce a tacit understanding that no candidate shall take an unfair advantage over his adversary by unworthy concessions. When the vote of the Home Rule League has no longer any value, the audacious attempt to use the perfect equality which Irishmen enjoy in England for the destruction of English government in Ireland will necessarily be abandoned. The only painful impression which is left by the debate is produced by the expressions of discontent in which all the Irish speakers concurred. The remedy which is proposed may be inapplicable and mischievous; but the feeling of alienation which prevails deserves careful study. It is to be hoped that at some future time Irishmen may be as incapable as Scotchmen of suspecting that their national character is regarded with indifference or contempt. The spiteful freaks of two or three obscure Irish members ought to be visited on themselves and not on their country.

CURRENT POLITICS.

THE meeting of the Middlesex Conservative Association gave Sir STAFFORD NORTHCOTE an opportunity of describing how he behaves and feels in his new capacity of leader of the House of Commons. It was perhaps a pleasant change to him to have an occasion when it was proper for him to make a speech; for, as he informed his hearers, he had some years ago been put up to a little secret by Lord BEACONSFIELD, who informed him that the great thing for a leader in the House to do was to hold his tongue, and speak as seldom and as little as possible. It does not appear, however, that when he has an unbounded opening for eloquence before him he has very much to say, or that what he has to say is of a very high quality. Mr. GLADSTONE, no doubt, spoke too much when he was leader; he could not sit still, and was like a schoolmaster who constantly interrupts his boys, instead of letting them say their lessons. Lord BEACONSFIELD showed more tact, and better consulted his own dignity, by maintaining a vigilant silence, his opponents feeling all the while that, if he did speak, he would probably say something which would be very well worth hearing. It was truly and gracefully said of Lord BEACONSFIELD, by the leader of the Opposition, that when he took part in a debate, he seldom failed to raise the tone of the discussion; and whenever he spoke out of the House he was often paradoxical and bewildering, but he was never poor. His

hearers felt that, however much they might criticize his utterances, they were listening to a man who was unmistakably the first, or one of the first two, men in English political life. Sir STAFFORD NORTHCOTE has no pretensions of this sort. There are at least fifty men on the Ministerial side who would have made as good a speech as he made to the Conservative Association. It is quite true that a man may make a very tolerably good leader of the House without having any peculiar originality or force of thought or language. Many humble qualities go to constitute a capacity for leadership; patience, tact, honesty, and courtesy. Sir STAFFORD NORTHCOTE has these qualities, and is so far very well qualified for his post. But we have to go back as far as Lord ALTHORP to find another instance of a leader of the House who has had so conspicuously to rest his claims on moral rather than intellectual qualifications. The times are dull when a leader is longing to get back to his ballocks, and speaks as if he detested speaking, or when he descends to jokes almost too small for a comic paper, and affects to apprehend that before long Mr. BIGGAR will stop debate altogether by filling the keyhole of the entrance-door with dust. There is no harm in little sallies of playfulness like this; but they are so completely in the vein of Mr. CHARLEY when addressing his constituents at Salford, that we might hope for something better when the leader of the Commons is making a set speech at a moment of unusual gravity and importance. In such a position, and at such a time, the speaker is addressing not only his hearers but his country, and a poor speech is a disappointment simply because it is poor. When a bishop preaches in a parish church, the congregation reasonably expect to listen to a better sermon than they ordinarily get from a curate.

Sir STAFFORD NORTHCOTE complained that he had found his patience exposed to extraordinary trials this Session. Mr. BIGGAR and Mr. PARNELL have certainly been an insufferable nuisance, not only to him but to every one in the House; but there does not appear to be any ground for complaining of the Opposition generally. According to Sir STAFFORD NORTHCOTE, the Opposition has been very vexatious because it has been suffering under a sharp disappointment. It hoped that it was carrying the country with it on the Eastern question, and when it found that the country supported the Ministry, it had to revenge itself by using petty tactics of annoyance and delay. This seems an account of matters exclusively adapted to the atmosphere of a Conservative Association. The Opposition has been silenced because the Ministry has done what it wished to see done. The policy of Sir STAFFORD NORTHCOTE is the policy of Lord HARTINGTON. The only disappointment of the Opposition is the disappointment of finding that the Ministry does what the Opposition thinks right. What difference could there have been in the recent attitude of England if Lord GRANVILLE had been at the Foreign Office instead of Lord DERBY? It has been announced that England considers herself relieved from a strict adherence to treaties when times and circumstances have changed. Mr. LAYARD has been instructed to tell Turkey that she shall have no material support from England because she has forfeited by her misconduct and obstinacy the right to claim it. Captain HOBART has been informed that he cannot be allowed to hold a commission in the English navy while he acts as the Admiral of a foreign fleet against a Power with which England is on friendly terms. There really is nothing for the Opposition to object to. Whenever it is the leaders of the type parties who are speaking, and not mere irresponsible underlings, they say precisely the same things on every point of importance. One set makes the most of Mr. GLADSTONE's eccentricities, and the other makes the most of Lord DERBY's failures; but they mean the same thing. The joint is the same, and nothing but the garnish is different. One party serves the boiled beef with carrots, and another serves it with turnips; but the boiled beef is always there. While Sir STAFFORD NORTHCOTE was speaking to his Conservatives, Mr. GOSCHEN was speaking at the Mansion House; and if what Sir STAFFORD NORTHCOTE said had been put into the mouth of Mr. GOSCHEN, and what Mr. GOSCHEN said had been put into the mouth of Sir STAFFORD NORTHCOTE, so far as each touched on the relations of England to the East, no one would have noticed any difference. Both agree in thinking that England ought to keep herself neutral until the interests and integrity of the Empire are threatened, and then England ought to act firmly and boldly. Some Conservatives have worked themselves

into a belief that the Turks are innocent and injured people, and ought to be protected against the ambition of Russia. This is precisely what the Ministry does not think, and what the leaders of the Opposition do not think. The country at large shares this opinion; and therefore the country, the Ministry, and the leaders of the Opposition are of one mind. Many Conservatives really disapprove of the policy of the Ministry, and, to relieve their feelings, as they cannot declaim against their own leaders, they declaim against the Opposition; but all they have to say tells against the Ministry more even than against the Opposition, for the Ministry has the responsibility of practical action. It is the Ministry that tells the Turks they are not worth fighting for, and it is the Ministry that repudiates the notion that England is under any engagement to resist Russia. The leaders of the Opposition are reported to have held a meeting of the party, and to have decided that no question as to the conduct of the Government should be raised. If they were to have a meeting at all, they would come to no other decision. How could Lord HARTINGTON be expected to censure the Ministry for doing precisely what he would like them to do? All that the Ministry has to do is to keep its own party well in hand, and this it appears to be able to do in a very effectual manner.

In speaking at the Mansion House, Mr. GOSCHEN felt it to be his business to praise everything English to the skies, and he thought it convenient to compare the open, honourable, straightforward way in which the English Parliament has discussed the Eastern question with the reserve and reticence exhibited by foreign countries. If an allowance is made for difference of circumstances, this criticism seems somewhat harsh. Mr. GOSCHEN himself seemed to see something beautiful and dignified in the silence of France, but that was the only exception. It is not easy to see why the Italian Parliament should be accused of being too reserved. A debate has been going on in Rome this week in which, on the one hand, the strongest sympathies have been expressed for the Christians, and, on the other, a deputy has declared that he is a better Turk than the SULTAN himself is. No one has gone quite so far as that even in frank and outspoken England. The Italian Ministry has not only published all its more important despatches on the Eastern question, but has distinctly explained its position and views. It has expressly declared that it has entered into no special engagements with any other Power. It was announced that it had made a secret compact with Russia, and now it asserts that nothing of the kind is true. "Having nothing to fear from Turkey," the MINISTER OF FOREIGN AFFAIRS said, "we have believed it to be our duty "to support the Turkish Empire, but without allowing "ourselves to be led by England or any other Power whatsoever." Italy, in short, will keep neutral, or, if she uses force, will only use it to protect her own interests. She is acting precisely as England is acting, and says so; and there does not seem much to choose between the utterances of the two countries. It may be remarked that Italy is the only country except England where public meetings on behalf of the oppressed Christians have been held, and the Italian meetings have been large, numerous, and enthusiastic. In face of these meetings, the Italian Ministry has acted just as the English Cabinet has acted. It supported Turkey as long as it could, but it made it perfectly clear that it was not going to fight for Turkey. But what Mr. GOSCHEN more especially complained of was the cynical silence of Germany. Why should the silence of Germany be called cynical? Germany has all along declared that it would remain neutral unless its interests were imperilled. There is nothing cynical in that. It does simply what Italy and England do. It naturally does not disclose under what imaginary circumstances it would consider its interests imperilled; but neither does England nor any other Power that has the least common sense left it. Mr. GOSCHEN is as resolute as any Englishman in saying that anything like serious danger to English interests must be averted at any cost. But his contempt for silence does not betray him into the mistake of disclosing what he means, of anticipating the possible issues of a campaign which has hardly begun, and of contemplating England as isolated, and as having interests which do not concern other nations. Nor can it be said that Germany is altogether silent. There has been an Eastern debate at Berlin, as well as in other places; but, if silence has been broken, it

has not been broken to much purpose. The speakers had little more to say than that the Government of Russia was bad and the Government of Turkey was very bad; that they were glad the policy of their Government was pacific, but were sure the Government would see that the interests of Germany must be protected. This is a true, but it certainly is not a new, way of regarding the Eastern question. England, Germany, and Italy are pursuing the same course and holding the same language; but whether the same thing is said a hundred times or only once or twice is merely a difference of national tastes and habits.

FRANCE AND ITALY.

THE French Chambers meet again on Monday, and the Government will at once have to deal with an ecclesiastical difficulty. During the recess the Ultramontane party has been unusually active, and the Government has on two or three occasions thought itself obliged to repress a zeal which threatened to make, not only the foreign policy of France, but also the domestic policy of foreign countries, a matter of popular discussion. The Bishop of NEVERS sent a copy of his letter on the Papal Allocution to every official in his diocese, on the plea that, as it is the duty of the State to protect the Church, it is the duty of every subordinate of the State to see that this duty is discharged so far as lies in his power. The Catholics of France have been circulating a petition to the PRESIDENT imploring him to take notice of the unhappy condition in which the POPE is placed. And the flame thus lighted would have been kept alive, but for the interference of the Minister, by a succession of lay sermons in which the enthusiasm of a preacher new to the work would not have been checked by any fear of a possible withdrawal of salary. The Radical party have not been uninterested spectators of these events. Their affection for the Ministry is of that judicious kind which does not shrink from chastening its object, and their uniform desire is to place M. SIMON in a dilemma between the Conservative Senate, in which this revived religious enthusiasm probably commands a majority, and the anti-clerical Chamber, in which to be on good terms with the Church is the most certain road to defeat. If the Radicals challenge the Government to say in public, and with the rhetorical severity that is so much more likely to be used in debate than in official correspondence, what they have been saying in formal circulars and confidential letters, they may count, they think, on one of two results. Either the Government must declare plainly that the POPE must take care of himself, and that any effort on the part of French Catholics to bring his misfortunes under the notice either of the Executive or of the Legislature will be discouraged by all the means provided by law, or they must try to lessen the force of their own letters and circulars, and endeavour to avoid an open breach with the Conservatives. Either way the purpose of the Radicals will be answered. In the former case the Government must expect to lose such occasional Conservative support as it can still command, and it will then be thrown more decidedly than ever into the arms of the Radicals. With their aid M. SIMON can sustain a division in the Chamber of Deputies; without it, he will be beaten even there. In the latter case the Radicals will be able to represent the Government as truckling to the priests, and as ready to embroil France with Italy in order to minister to the designs of an unpatriotic faction. In so far as this view is accepted, M. SIMON will lose strength in the Chamber of Deputies; and since his conversion is certain not to be of that hearty kind which can alone satisfy the clerical party, his loss of Republican support will not be compensated by any gain on the side of the Conservatives. The clerical party are quite as anxious to precipitate an ecclesiastical discussion as the Radicals themselves. They think that they have been insulted during the recess, and, rightly or wrongly, they also think that they are strong enough to make it useful to convince the country that the Government is not with them. To what extent this opinion is well founded it is impossible to say. The zeal of the Conservative Republicans has cooled so much of late that it is possible that the Conservative feeling of the country may have once more accepted the Church as a necessary element in the equilibrium whether of France or of Europe. However this may be, there seems to be no question that the Catholic deputies will bring the ecclesiastical incidents of the recess before the

Chamber, unless the Government can make the outbreak of war a plea for avoiding all discussions that involve inconvenient references to foreign affairs.

Both the Royalists and the Imperialists have now accepted their position as candidates for clerical favour; and the organs of each party are doing their best to show that, if their policy had been adopted, France would have been spared the melancholy results which have followed from the unification of Italy. Upon this point the Legitimists have very much the best of the argument. They can taunt the Bonapartists with having coquetted with the Revolution, with having assented to the spoliation of the Pope in the first instance, and with having vainly thought that they could enter upon a course of evil-doing and yet retain the power of stopping short when it pleased them. It must be admitted that events have made the Ultramontane view of recent history an exceedingly plausible one. The unity of Italy and the unity of Germany have brought France nothing but disaster in one shape or another. The policy which would have kept Italy divided because her union would be prejudicial to the Pope's temporal interests, and would have kept Prussia feeble because a Protestant Power can never be trusted not to use its strength in a way that may be mischievous to religion, would to all appearance have saved France from the disasters of 1870. The legitimist party have no difficulty in explaining their conduct on either of these points. Their sympathies were on the Catholic side alike in 1859 and 1866. They were never deceived by any fine phrases about nationality, or freedom, or the right of every nation to be master in its own house. They foresaw that the changes wrapped up in these words threatened to overturn the old order of things abroad, and this was a sufficient condemnation of them to a party whose only reason for existing was their determination to restore the old order of things at home. The Bonapartist position is much less easy to defend. They have to admit that NAPOLEON III. tried to reconcile the Church and modern civilization, which in itself invites the condemnation of a party that accepts the Syllabus as a practical exposition of political philosophy. They have to explain how he became a party to a convention which left the Pope nothing but the city of Rome, and thereby accepted a precedent which was afterwards applied with fatal logic to the city of Rome itself. The best case that they can make out for NAPOLEON III. is that he yielded to an overpowering necessity; but, though this may be true from the Imperialist point of view, it is not true from the Ultramontane point of view. There was no need for France to quarrel with Austria, or to be on good terms with Italy. The EMPEROR may have been under obligations which it would have been inconvenient or dangerous to ignore; but that only proves how ill-advised France was to take an Emperor, with his engagements, when she might have had her lawful King for the asking without any such embarrassing accompaniments. Their frank repudiation of the Imperialist policy does not prevent the Legitimists from making common cause with the Bonapartists against the Government for the time being. The two parties fully recognize that there can in the end be no peace between them; but they are equally willing to postpone hostilities until they have disposed of their common enemy, the Republic.

The best ally that either party has at present is the Italian Ministry, and their ability to embarrass their own Government will greatly depend on what goes on at Rome. The Committee of the Senate has reported against the Clerical Abuses Bill, and if the Ministry accept this as an excuse for letting it drop, the Pope will be deprived of his most telling plea. If the Italian Government are really about to enter on a course of ecclesiastical persecution, it will be impossible to keep the Catholics of other countries from treating the subject as one that closely concerns them. The French Ministry may do their utmost to silence the clergy and the Catholic press, but their utmost is not likely to come to much. The interest felt in the Pope's position is too extensive and too genuine to be easily suppressed, and the adoption of any really stringent measures to suppress it would involve the Cabinet in a series of annoying conflicts with the bishops, and, through the bishops, with the entire Right. If the Italian Ministry withdraw the Clerical Abuses Bill, the French Government will be able to represent that there is nothing new in the situation, and that the Pope is no worse off than he has been any time this seven years. Unfortunately the Italian Cabinet has

its own difficulties to arrange, and if it moderates its ecclesiastical policy, it may easily lose the majority which it gained at the last general election. On the whole, therefore, the prospects for the remainder of the Session at Versailles are unsatisfactory. Factions are strong, the Government is weak, and the disposition which the French Legislature has lately shown to avoid all dangerous or compromising questions is now seriously impaired.

THE UNIVERSITIES BILL.

THE quiet, not to say humdrum, character of the conversation which Lord FRANCIS HERVEY invited previously to the House of Commons going into Committee upon the Universities Bill leads to the reasonable expectation that the measure will be, in the words of Sir WILLIAM HARCOCK—who is not apt, except by accident, to drift into the character of RALPH—in fact, an enabling Bill. Indeed we may regard the debate, and in particular the assurances with which Mr. HARDY concluded it, as terminating what we may call the idle fellowships episode. There can be no doubt that Lord SALISBURY, when he gave rein to the epigrammatic incisiveness of his rhetoric, did not forecast the apprehensions which his words, in their naked abstraction, could not fail to convey to persons of less fervid imagination. However, the agitation would have been probably shortened in face of the explanations which so rapidly and so abundantly showered down, had it not been for the promptness with which the extreme party of University Reformers at Oxford took advantage of so unexpected a windfall of luck. These gentlemen, who may be said to occupy a position in the world of academic administration not dissimilar from that which the Home Rulers claim among politicians, or the Comtists among religionists, were ready with that infallible resource of a party which is all leaders and no followers—a volume of essays. The supposed exigencies of a Prisons Bill, which was after all withdrawn, led to the collapse in the Session of 1876 of University legislation, and in the meanwhile the literary success of their manifesto had not emboldened the pioneers of Research to take the academic stump. The Government proposal reappeared substantially as it had disappeared, only that the separate Bills for the two Universities were joined together, and that, upon the Oxford Commission, the name over which the most lively fighting was threatened was replaced by a respected head of a House; and that a very eminent man, whose antecedents would point to his being Cambridge by education, though Oxford by accident, was replaced by a *bona fide* illustration of the latter University. The Bill was read a second time in the earliest days of the Session, and until Thursday evening continued fitfully to reappear upon the Order Book, only to be postponed at the good pleasure of Mr. BIGGAR and his friends.

It was clear that the measure, coming up for discussion in Committee under these circumstances, though it might not want any further certificate of good character, would be none the worse for obtaining its testimonial. Plainly speaking, its previous history had been so fragmentary a record of spasmodic appearances and disappearances, that the general convenience would be much advanced by making *tabula rasa* of all former debates, and dealing with the principles which might be laid down at this stage as those to which the more detailed debates over the clauses should be confined. These may be briefly summed up in the statement that the Bill is intended on its theoretical side to recognize the collegiate system as the foundation of the Universities, the existence of prize endowments as the toll which abstract philosophy pays to living human nature, and the education of the governing classes—taken in the broadest sense of those words—no less than the pursuit of absolute knowledge as the condition on which the recipients of those prizes are to be entitled to hold them. The practical side of the Bill is that it is to be above all things enabling. As Mr. HARDY pointed out, the colleges were to provide for their own efficiency before they were to be allowed to divert their surplus to the creation of a supplementary professoriate, and even this professoriate was as far as possible to be connected with the colleges, after the example which, as early as the beginning of the century, Cambridge set (of which the evidence exists in the definition clause of the present Bill), when, in the then recently founded College of Downing, Professors of Law

and Medicine were constituted members of the collegiate staff.

The controversy is, as a question practically interesting to the public, concluded, and the monotonous appeal to the literary and scientific results of German research is in the narrowest sense of the word only an academic thesis. Granting that the Professors and the Privat-docents of a German University may represent something for which England cannot find a precise parallel, the same may be predicated of the *Bürschen*, and for parallel reasons. The German system, in letting loose the intellectual activity of the teachers, has been equally compelled to restrict the possibility of disciplinary control over the taught; and we believe that the great corporation of heads of families—for whose behalf the Universities do, after all, in a great degree exist—would be loth, in chartering German thinking at Oriel and Trinity, to unsheath German broadswords on Christchurch Meadow and Parker's Piece.

The fight over the names of the Commissioners seems to have ended in a reasonable and satisfactory manner. The Government was obviously right in expressing its confidence in either University by choosing its Commissioners out of its own body; while, in making the choice, practical and business-like qualifications were obviously more to the point than those of a technical description. When we look at the details of the persons taken or rejected, the most obvious incident seems to be that the Government conceived a head of a house at Oxford to be desirable and one at Cambridge to be undesirable, while the Opposition thought a head of a house at Oxford undesirable and one at Cambridge desirable.

PARLIAMENTARY REPORTING.

THE debate and the division on Mr. HANBURY-TRACY'S motion showed the amount of dissatisfaction which has been produced by the present system of Parliamentary reporting. The Government were probably well advised in refusing to grant an inquiry which could scarcely have led to any useful result. Sir STAFFORD NORTHCOTE has, since he has become leader, been too prodigal of Committees, and he may reasonably object to extend the practice unnecessarily. As in many other cases it is easier to recognize the evil than to devise a remedy; but the consequences of a decline in reporting may go to the root of Parliamentary government. In the last century the House of Commons governed the country by its inherent and direct power. At the present day Parliament requires the aid and feels the control of what is called public opinion; or, in other words, its authority is shared by a community which has been educated sufficiently to cultivate an interest in politics. It is natural that an able democrat, such as Mr. COWEN, should wish to extend still further the influence of political clubs, of one-sided public meetings, and of the popular press. He is perfectly consistent in feeling and expressing indifference to full and accurate reports of Parliamentary proceedings. In the recess, although there is sometimes, as during last autumn, abundant political activity, no party has, as a general rule, either desire or opportunity to hear what may be said on the other side; and it is only at elections that it becomes possible to ascertain whether comparative loudness of clamour coincides with prevailing convictions, or even with numerical preponderance. In private society prudent men habitually avoid controverted topics; and public meetings for any serious purpose of discussion have long been obsolete. The ordinary politician reads a newspaper which exaggerates his own opinions, and if he is of a gregarious disposition he consorts only with members of his own party. An habitual and exclusive student of the *Daily News*, who six months ago amused his leisure by frequenting atrocity meetings, may possibly have been in the right, but he was indebted to accident for his political orthodoxy. In dealing with less exciting subjects the English newspapers of the higher class are much fairer and more tolerant than those of America or of France; but they are permanently directed by the same persons, who are properly anxious to maintain and propagate their own doctrines.

Parliamentary debate has become the only effective form of political controversy. Except perhaps in obscure debating societies, there is no other place in which adverse parties meet on equal terms, and deal with conflicting arguments. It is in some degree because speeches in the House of Commons are rarely addressed to constituents

that they exercise enormous influence beyond the walls of Parliament. Readers of newspaper reports, consciously or unconsciously, recognize a genuine conflict of opinions, and learn the true issues which can only be raised by opposing advocates. Mr. GLADSTONE remarked with truth that Parliamentary reports were never so full and elaborate as in the years which followed the Reform Bill. It was in that time that Sir ROBERT PEELE, by his speeches in Parliament, reconverted the country to Conservatism. The advantage of the operation may be disputed by those who differ from his opinions; but the result was attained by thoroughly legitimate means. The member in the story who boasted that speeches on the other side, though they had often changed his opinions, had never affected his votes, paid an involuntary tribute to the power of eloquence and reason. When the majority of the zealous partisan's associates had been long subjected to the same process, their policy and consequently the votes of their adherents would be sensibly modified. Neither the importance nor the rarity of free discussion is generally understood. The whole administration of justice depends on the unlimited freedom of advocacy which has long been established in England. A mode of government which ultimately rests on popular majorities can only work well under the same conditions; and the publicity of Parliamentary debates has hitherto approximately satisfied the conditions of political education. The minority is more especially concerned in maintaining freedom of discussion, which is often distasteful to popular politicians. Mr. CORBET used to protest against leading articles in newspapers; and Mr. COWEN would not regret the suppression of Parliamentary debates. There is no doubt that it is much easier to outvote an opponent than to answer his arguments. In theological quarrels, dominant sects have uniformly desired to silence their heretical adversaries, though they have professedly been ready to confute them.

The greatest orators in the House of Commons might have been expected to regard with personal indifference the decline in Parliamentary reporting which still leaves room for full versions of their own speeches. Mr. BRIGHT perhaps expressed the susceptibility of an artist who is naturally offended by the obliteration of his delicate refinements of workmanship. To newspaper readers Mr. BRIGHT's reported speeches appear masterpieces of style; but there can be no doubt that the original composition was more perfectly finished. Mr. GLADSTONE was more paradoxical in his regret for the omission of useful statistics or facts which are omitted by reporters because they have no room to spare for uninteresting details. It would of course be possible to publish literal transcripts of every word which is spoken in Parliament; but readers could not be so easily procured as shorthand writers. It is unnecessary that the whole community should be consulted on the matters which form the subject of discussion in Committees of Supply. Parliament has some business which is exclusively its own, while in great political controversies it is the organ of the whole country. During the debate several members aptly reminded the House that a complete and elaborate record of its proceedings would be useless if it were only printed to be laid on the shelf. The influence of Parliament depends in great measure on newspaper reports, which can only be furnished by private enterprise displayed in a particular form. Thirty or forty years ago it seemed that the necessary publicity was effectually secured; but the establishment of penny newspapers has greatly deteriorated the reports. The *Times* only two or three years ago was apparently on the point of following the mischievous example of some of the cheap papers. At that time speeches were sometimes given in the summary more fully than in the ordinary report; and comments in leading articles were often unintelligible because the corresponding passages of the debate were not reported. For the present the older and better practice of reporting has been resumed; but an accidental cause has led to the omission of a not inconsiderable part of Parliamentary proceedings. Country papers have for some years past published the telegraphic news of the morning at the same time at which it appears in London; and they have consequently competed on advantageous terms with rivals who are, notwithstanding Mr. GLADSTONE's preference for the provincial press, much their superiors in general literary merit. The London proprietors have consequently procured the despatch of fast trains in the early morning, which deliver the London papers before breakfast-time over a great part

of England. The hour of publication has therefore necessarily been altered; and the reporters are compelled to omit nearly all the debates which occur after midnight. The indignant contempt which is felt in the House of Commons for two or three obstructive members would be more fully shared by the whole community if the late discussions and divisions were reported.

There is perhaps some ground for the apprehension that the publication of literal reports of speeches would tend to encourage loquacity; but the strongest objection to the proposal of an official report is that it would never be read. The comparative space allotted to various speakers was, in the best days of Parliamentary reporting, a rough kind of natural selection tending to the ultimate survival of the fittest. It is true that unjustifiable partiality or ill will was in a few instances displayed, though Mr. WHALLEY'S suspicion that he has been wronged by Ultramontane reporters may probably be fanciful. As long as three or four full reports were published every morning, some security was afforded against undue preference and personal spite. An official shorthand report would protect the worst speakers as well as the best. It is unfortunately useless to remonstrate with the conductors of newspapers, who, when their own practices are called in question, display with wilful ostentation a kind of egotism which is regarded in the case of less privileged personages as a proof of bad taste. If the *Times* should at any future period carry into effect its recent threat of discontinuing the publication of full reports, it will probably be necessary for the House of Commons to adopt the imperfect remedy of employing official shorthand writers. The substitute would be comparatively inefficient, but the publicity of debates could not be sacrificed without an effort. The establishment of Parliamentary supremacy was gradual and imperceptible. Its decline may perhaps commence when the community becomes indifferent to Parliamentary debates. The State and Federal Legislative Bodies of the United States exercise comparatively little influence, and it may be doubted whether the circumstance that their debates are scarcely reported is a cause or an effect. It is not a satisfactory reflection that the proprietors of two or three newspapers have the key of the English Constitution in their pockets.

SOUTH AFRICAN FEDERATION.

LORD GREY'S observations on the South Africa Bill which was read a second time on Monday may hereafter be recurring to us as an example of fulfilled prophecy. It is impossible not to feel that he has very great reason for the fears which he expresses. The most formidable problem with which the English Government has to deal in South Africa is the existence of a powerful native population. Lord CARNARVON stated, in moving the second reading of the Bill, that in the opinion of Sir GARNET WOLSELEY no source of danger in South Africa is so great as the extensive possession of arms by the natives; and when it is added that these arms are possessed by a race which numbers a million in the English Colonies, and at least another million in the Transvaal State, it needs no argument to show how truly Sir GARNET WOLSELEY has estimated the situation. Lord GREY contends that this is not a state of things to which what is called responsible government can be safely applied. In dealing with savages it is essential to be firm, consistent, and just. But there can be neither firmness nor consistency in an administration which is liable to be changed every six months; and as for justice, what chance is there of its being dealt out to a native majority by an Assembly returned by a white minority? In South Africa either the natives must be represented, in which case the supreme power will be vested in the hands of savages who are altogether unfit for it, or they must be left without representation, in which case they will be at the mercy of a class whose interests are entirely opposed to theirs. When a small civilized minority and a large uncivilized majority have to live side by side in the same community, the only safe mode of dealing with them is to place them both under the control of an impartial authority. The Home Government is such an authority; but, so long as the conditions of South Africa remain what they are, no colonial Government can possibly answer to the description. Lord CARDWELL urged, in answer to these forebodings, that since the introduction of responsible government into the separate South African Colonies the native popu-

lation has gone on increasing in prosperity and advancing in civilization. Unfortunately, the past as painted by Lord CARDWELL is not incompatible with the future as painted by Lord GREY. The protection that English law has accorded to the natives has induced them to come over into English territory in very large numbers. In Natal it is estimated that they have increased as much in a day as the white population in a year. It is not until the natives have become formidable that the danger of responsible government is felt; until then the materials of danger are only preparing. That a war of races is more than possible in South Africa can scarcely be denied, and the system of Government established by Lord CARNARVON'S Bill may too probably be found a very ineffectual means of averting it.

It is possible, however, to admit all this, and yet to feel that some such measure as Lord CARNARVON proposes is the best that can be devised under the circumstances. It is too late to discuss the propriety of introducing responsible government into South Africa. It has been introduced, and it cannot now be withdrawn. The only question therefore to be considered is whether responsible government as it now exists, or responsible government as it will exist under Lord CARNARVON'S Bill, is the more likely to justify Lord GREY'S alarm. Lord CARNARVON'S speech is conclusive upon this point. So long as the South African Colonies are divided, it is in the power of the least wise among them to precipitate a native war; while the natives are not deterred from precipitating it on their side by the visible strength which union will confer on the white population. It is in the colonies in which the white settlers are fewest and the natives most numerous that hasty and imprudent counsels are most likely to find acceptance. If the colonies are united into a single Federation, these imprudent counsels will at least be tempered by the influence of communities which have more to lose, if not more to risk. It may be that in the end the attitude of a South African Federation towards the natives will be as provocative of hostilities as the attitude of a single colony. But it is not likely to be so in the first instance, and the longer a war of races can be postponed, the more chance there will be of averting it altogether. The example of Barbadoes has lately shown how obstinate and unreasonable the behaviour of a very small colony can be. It is unlikely that, if the SECRETARY OF STATE had been in communication with a West Indian Confederation, he would have been met with so much childish petulance. There is ground for hope that the action of the South African Confederation will be equally superior to the action of its separate members.

The special feature of Lord CARNARVON'S Bill is the number of points which it leaves to be settled hereafter. Though negotiations have been going on between the Colonies and the Home Government for a considerable period, the details of a scheme of federation have not yet been arranged. Two months ago Lord CARNARVON thought that some progress had been made, and the draft Bill which he then sent out for consideration contained a more definitive proposal of union than he now feels able to bring forward. In the draft Bill the several colonies composing the confederation were to be represented proportionately to their population, and the term "population" was defined to exclude African natives. This provision was strongly objected to by the white settlers in Natal. The total population of Natal is about 370,000, and the total population of the Cape Colony is about 721,000. This would give Natal half as many members in the Legislature as the Cape Colony. But, inasmuch as the whites in Natal only number about 20,000, while the whites in the Cape Colony number about 273,000, Natal under the draft Bill would only have had one member for every thirteen members returned by the Cape. It was not to be expected that Natal should submit without remonstrance to a discrepancy of this magnitude. The existence of a native population does contribute something to the industry and prosperity of the colony, and though Natal might be better off if her whole population were whites, she would certainly be worse off if these 20,000 whites composed her whole population. The same difficulty was felt at the formation of the American Union, and it was there got over by including three-fifths of the slaves in the estimate of the population of the several States. Sir HENRY BARKLY says that this plan would not work well in South Africa, and suggests that the revenue of each colony be taken into account as well as its population, and that the representation of each in the

Legislature be determined by the comparative products of these two factors. In the draft Bill, again, the Legislative Council was to be appointed by the Governor-General, and, considering the many objections to a system under which both Chambers are elective, this plan is in itself perhaps the best that can be suggested. It has not been so regarded, however, at the Cape. In the history of that colony, a Council elected by the aggregate constituencies of the Eastern and Western provinces has played an important part, and Sir HENRY BARKLY reports that the clause making the members of the Legislative Council nominees of the Governor-General is generally objected to. His own impression while in Australia was that the elective Council of Victoria, returned by large constituencies composed of voters possessing a higher property qualification than that demanded from the electors to the Assembly, "was far better adapted to act harmoniously as "a Conservative check" than the nominee Council of New South Wales. The idea which finds most favour in the Cape Colony is that the members of the Legislative Council should be elected by the provincial Legislatures for a term of years, just as the United States Senate is elected by the Legislatures of the several States. The provinces of the Confederation, according to the draft Bill, were to be governed by a President appointed by the QUEEN, and holding office during her pleasure. Sir HENRY BARKLY inclines to making these appointments elective, while in Natal it seems to be thought that they had better be vested in the Governor-General. Upon all these points Lord CARNARVON has so framed the revised Bill as to leave room for further consideration. The Legislative Council and the House of Assembly are to represent the various provinces of the Union, not according to population, but in such proportions "as the QUEEN may direct." The members of the Legislative Council are to be appointed "as the QUEEN may direct." The chief executive officer of each province is to bear such title, and to be appointed in such manner "as the QUEEN may direct." All these matters will hereafter be arranged by correspondence between the Home Government and the colonies, and the conclusions finally arrived at will be announced by an Order in Council. In this way a union will be constituted into which any or all of the Colonies and States of South Africa may voluntarily enter. No pressure of any kind will be applied; but as soon as any two or more colonies shall agree to be confederated together under one general Government and Legislature, the QUEEN is empowered to declare by an Order in Council the union accomplished. Lord CARNARVON deserves the highest credit for the patient forbearance with which he has conducted the whole negotiation.

THE BURIAL LAWS.

THE grievance of the Dissenters about the Burial Laws is now a very old story, and has been discussed over and over again: and of course nothing new can be said about it. Still the debate in the House of Lords on Thursday has served a useful purpose in bringing out very clearly the essential elements of the question and presenting it in a plain matter-of-fact and practical form. It has also revealed in a very significant manner the spirit and motives of the opponents of the measure. The general scope of the Bill may be gathered from the preamble, which sets forth that "it is expedient, with a view to the protection of public health, to make further provision respecting the closing of burial-grounds which are injurious to health; to facilitate the establishment of new burial-grounds; and to consolidate, with amendments, the Acts relating to burials." The opportunity has also been taken of testing the sincerity of the Dissenters in their professed desire for the settlement of a question which they seem to find, especially just now in the dearth of other subjects, a very convenient pretext for party agitation. There is usually very little use in trying to conciliate people who are determined, for their own reasons, not to be conciliated; and it is indeed plain that the political Dissenters are simply exasperated at the prospect of losing a useful cry. The legislative history of the last half-century is a record of a series of concessions to this class which have been successively accepted as a fulfilment of all that was required; but new claims have continually been invented, and there can be no doubt as to the ultimate object which the agita-

tors have in view. As Lord SALISBURY remarked, "the Sibyl of old, if somewhat hard-fisted, was honest, and stuck to her bargain; but the Sibyl of our time, though she demands more if you refuse her offer, demands a great deal more if you concede it." It is, therefore, hardly to be expected that the Nonconformists will accept any compromise, however reasonable, of such a controversy; and the only question is whether they will be able to carry out their design of obstructing an important sanitary measure, for the sake of a small and rather fanciful denominational grievance.

The greater part of the Bill is occupied with provisions for the protection of the public health, as to which there cannot be any dispute, except perhaps as to certain details which may easily be settled in Committee. The evidence of the necessity for legislation of this kind is indeed quite conclusive, and admits of no answer. The Bench is unanimous in its condemnation of what Chief Justice Cockburn justly calls "this complicated, entangled, and confused mass of legislation." Moreover, the law is not only confusing and difficult to administer, but it is not adapted to the circumstances of the present day. The Vestries have power, if they choose, when a burial-ground is closed by Order of Council, to establish another; but they cannot be compelled to do so, and in some cases they grossly neglect their duty in this respect. At Northampton, for instance, the Vestry has persistently refused to avail itself of its permissive power, and there people have to be buried in unconsecrated ground. Other defects of the law are that neither a Vestry nor a Burial Board has powers for the compulsory purchase of land; and that the Home Secretary, under whose supervision such matters come, has no authority to enforce inspection of burial-grounds, though it seems to be greatly wanted. It has been stated by the Duke of RICHMOND that in the rural districts there are churchyards in which the bones of the dead are brought to the surface at each new interment, and which are still open for further corruptions; and the Bishop of OXFORD has also said that "he hears constantly of gross scandals arising from the overcrowding of churchyards." In order to meet these difficulties, the Bill proposes that the jurisdiction over burial-grounds shall be transferred to the Local Government Board, which, in the case of any burial-ground where there is not proper space for burial, or where, by reason of its situation in relation to the water-supply of any place, or by reason of any circumstances whatever there is any injury to public health, is to have power, after local inquiry, to make an order that burials shall either entirely, or subject to specified exceptions, be discontinued in the churchyard in question. Such order, however, is not to be valid unless confirmed by an Order in Council, or, if it affects a cemetery established under a local Act of Parliament, without Parliamentary confirmation; and there is a provision that closed burial-grounds shall be maintained in proper sanitary condition and decent order, and protected from desecration. Again, there is to be a burial authority in every parish, and when it appears that, by reason of increase of population, or otherwise, additional ground is required for the burial of the inhabitants of the district, the authority is bound to provide the necessary accommodation on the requisition of twenty ratepayers; or the Secretary of State, if the local authority refuses or makes default, may, if he thinks fit, enforce the obligation. One part of such a burial-ground is to be consecrated and set apart for burials according to the rites of the Church of England, and another part to be unconsecrated and assigned to burials conducted otherwise than according to those rites; and the relative proportions of such divisions is to be sanctioned by the Local Government Board. There is also to be a chapel for each division. Where a burial authority is wanted, but is not established, the Local Board is authorized, after local inquiry, to order that one should be constituted. There are also to be facilities provided for the burial or sanitary authorities acquiring land for burial-grounds.

Such is the substance of the Bill in regard to sanitary matters; and, although there are some points—such as that of the twenty ratepayers, the Home Secretary's powers, and the question whether the Vestries ought to be invested with the authority proposed—which will require careful consideration in Committee, it clearly contains the elements of a practical and much-needed reform, and this is generally admitted. It also contains a clause providing that in churchyards, on a request to the incumbent from the

person in charge of a funeral, the burial may take place without the usual religious service. It is this latter provision which the Dissenters resent, though it is a relaxation of the existing law which they have themselves demanded. The inconsistency of this body is strikingly shown in the contempt for what they call the "superstition" of consecration—"What d'ye call it—consecration?" sneered Mr. BRIGHT last year; and another member mockingly described it as "The Bishop mumbled 'a form of words'—and their eagerness to be buried in ground of this kind. It might be thought that the Dissenters would be thankful to anybody who would provide them with places where they could be buried comfortably after their own fashion. But no, they are wretched because they are not made martyrs by being laid in the churchyards.

LORD GRANVILLE was of course studiously moderate and gentle in his language, but the speeches out of doors supply what he leaves unsaid. The General Committee of the Primitive Methodists, for instance, protests against the proposal to have two mortuary chapels in each new burial-ground, "one of which would be kept for the exclusive use of Episcopalians," and would thus "perpetuate even 'in death the most odious assumptions and distinctions.'" At the recent Conference of the Liberation Society resolutions were passed objecting to "the exclusion from consecrated ground of all services and all ministers but 'those of the Church of England'; and further even 'the division of ground into consecrated and unconsecrated parts,' and 'the extension and perpetuation in burial-grounds provided at the public expense of the exclusive rights and the claims to 'exact fees now exercised and enforced by the clergy and clerks and sextons in the existing churchyards.'" On this ground the Bill is wildly denounced as a "measure originating in clerical pride, and a violation of 'liberty, justice, and religion.'" Mr. PIERCE said he was "heartily ashamed of the superstitious views entertained 'with regard to consecration,' and yet he was furious at not being allowed to be buried in such ground on his own conditions. He also called the Church of England "one of the worst forms of religious intolerance the world has ever seen." Alderman FOWLER was still more outspoken, and ingenuously disclosed the aims of his party. He said "he thought that the question before the Conference should 'assume a practical as well as a hortatory character.'" Mr. STANSFELD went still further, and said he hoped that "this 'attack on the Liberal party would stimulate and rouse 'the somewhat latent sense of the necessity of union in its ranks, and that he believed it would tend to loosen 'the hold of the Established Church on the affections 'of the people, and to hasten the inevitable decay.'" There is no misunderstanding this. In the opinion of at least one member of the late Government, the object of this agitation is to bring the Liberals together, and to hasten the disestablishment of the Church. LORD GRANVILLE says he does not believe this, and that, if he did, he would not have moved his Resolution; but he evidently shuts his ears to the voices around him. It will be remembered that last year one of the organs of the party celebrated the "bringing together of a powerful force, combining the 'ardour of the Dissenters, the energy of the Home Rulers, and the statesmanship of the Whigs.'" The *Daily News*, the special mouthpiece of political dissent, urges that the Bill should be thrown over "till the opportunity comes for settling the dispute on that basis of 'equality on which alone it can permanently rest.'" Free and unrestricted admission to the churchyards would, of course, be a useful step towards invading the altar and the pulpit, and the arguments which are used in the one case, such as they are, would apply to the promiscuous entry of all kinds of so-called ministers to the Church to preach, marry, and baptize. In short, there can be no doubt that this agitation has its root in the spiteful jealousy and hatred which a certain class of Dissenters cherish towards the Church, as something that hurts their vanity, and makes them feel inferior.

As to LORD GRANVILLE's Resolution, it is a variation from that of last year, but not less vague and empty. His former Resolution gave permission for "silent" burials, and also for "Christian burials with a service other than that of the Established Church." He now asks, first, for what is already granted—facilities for the interment of persons in churchyards without the use of the Burial Service of the Church of England; and, next, for the funeral to be con-

ducted with "such Christian and orderly religious observance as to them"—the relatives or friends—"may seem fit." It is obvious, however, that this, in itself, settles nothing, and opens the door for almost everything. What is wanted is a definite and precise statement of what is to be permitted. In the House of Commons Mr. MORGAN said, "I will tell the House what safeguards I would propose. None whatever. This is a matter which we might safely trust to the good sense and feeling of our fellow-countrymen." It is notorious, however, that there are sections of the community who have peculiar notions as to decency and propriety; and after the recent example of the sort of oratory which was attempted at Mr. OGBURN's funeral, it is easy to conceive how the fashion might spread. In a public cemetery this might not so much matter; but in a churchyard which is identified with the Church it would be insufferable. If LORD GRANVILLE would propose a clause embodying these conditions, the controversy would be simplified; and possibly a satisfactory form might be drawn up, if the Nonconformists were really in the mood of LORD GRANVILLE and LORD SELBORNE. LORD SHAFTESBURY and Mr. MORLEY have tried to procure the acceptance of a compromise of this kind but have failed. It is open for any one to contend that if this task were taken up by one or two moderate and reasonable people, a safe and guarded rule might be devised which would put the subject on a proper footing. But, though this, if possible, would be satisfactory to most people, it is idle to expect that it would satisfy the more bitter and fanatical Dissenters, or put an end to the system of party agitation of which it is so handy a pretext. Under these circumstances, it can hardly be hoped any absolute settlement of this particular difficulty is practicable; but that is no reason why a valuable sanitary measure should be lost on account of a petty ecclesiastical squabble.

THE ANCIENT THIS.

WHEN historians have to measure time not by reigns, but by dynasties, the modern student's mind faints. We may reckon, perhaps, ten dynasties in England since the days of Egbert, a thousand years ago; but it is eleven hundred years since Egypt, conquered by the Arabs, ceased to count the Empire as her thirty-fourth dynasty. Fully fourteen hundred years have to be reckoned back beyond Caesar and Cleopatra, according to M. Mariette, to reach the reign of Rameses II., the great Sesostrius of the Greeks. But Rameses was the third king of the nineteenth dynasty. That is to say, roughly speaking, there were about twice as many dynasties between Rameses and the founder of the Egyptian monarchy as there have been between Queen Victoria and Egbert. All recent investigations go to prove the substantial truth of the lists of Manetho. M. Mariette virtually adopts them, for want of better, and all his diggings help to confirm him in trusting them. According to Manetho, there were two kings of the first dynasty, six of the second, eight of the third, and so on, nothing in their average of years differing from our own. So that our English antiquaries have been very moderate in placing the foundation of the Egyptian monarchy back at a period so remote as 2700 B.C., and even Bunsen, with his estimate of 3,000, and M. Mariette, who does not hesitate to adopt Manetho with 5,000 at once, have something of proof on their side. To attain therefore any adequate notions on the subject of Egyptian chronology is by no means an easy task. The mind accustomed to measure time by our short English standards refuses to digest the nuts offered by Manetho. There are evident faults in the copies which are extant. They are themselves only quotations made by ancient authors, and are manifestly corrupt. One turns with almost a gleam of hope to Manetho's assertion that King Apappus, of the sixth dynasty, was a giant, and reigned for a century. But *Papi* means a giant in the ancient language of the Nile valley, now represented by Coptic, and, in an inscription now at Boulak which is undoubtedly of the sixth dynasty, mention is actually made of the hundred years of his reign. What are we to do? Among other frantic efforts lately made to resist evidence of this kind, some one has supposed that these old Egyptians cut up one year into three or four. But what can they make of King Papi's nine cubits?

The tablet of Onna, to which we have referred, was found in a tomb at Abydos, the ancient This. It records the life and services of the functionary whose name it bears, and is among the spoils with which M. Mariette has enriched the Khedive's museum. By comparison with another tablet he has made out the names of four kings of this sixth dynasty, which, according to all historical analogy, ought to be wholly fabulous. But this is only one among many examples which could be given of the way in which M. Mariette is working, and of the success which has so far attended his labours. He has literally discovered the remains of This, or Thinis, the cradle of the Egyptian monarchy. Their site was known, it is true; but they were buried in sand and in the mud-

heaps accumulated by centuries of unburnt brick. Above all, in the narrow passage between two walls of a temple there, he has found the now famous tablet of Abydos, casts of which are in all the museums. Here Sethi I. and his mighty son Ramesses II. are represented offering sacrifices to twenty-six of the kings who preceded them. The list begins with Menes. The names are a selection from those given by Manetho, as are the names on the Hall of Ancestors at Karnak, and those on the tablet of Sakkarah. M. Mariette speaks but slightly of a fragmentary tablet also known as that of Abydos, which is in the British Museum; but M. Mariette's countrymen have unfortunately, in matters of this kind, given the world too many examples of what Mr. Herbert Spencer describes as the bias of patriotism; and the English traveller will probably go home without any diminution in the reverence he feels for the thirty kings whose names remain upon it. After the first shock is over, and the mind has begun to judge with comparative calmness of these stupendously long periods, they separate themselves into distinct groups. Just as on the tablets selections were made among the too numerous predecessors, so, in endeavouring to classify the wonders of Egypt, the modern traveller finds it convenient to discard his original ideas of the ancient civilization. To many the whole list of Pharaohs from Menes to Ptolemy Physcon consists of one long unbroken line; the religion, the language, the habits, the dwelling-places, the burial-places, the "antikas" now dug up or manufactured, all belong to one people, one succession of kings—nay, to judge by what we hear and read, one period. Ancient Egypt is contrasted with modern, as one might contrast the Commonwealth with the reign of Charles II. No attempt is made to remember that the period which separated the first Sethi from the last Ptolemy was probably as long as the whole Christian era. In that time all the kings were not great, powerful, and rich. And in the old time before them, though here, as we have seen, years fail us as a measure, were there not eighteen dynasties, of which some consisted of half a dozen kings? Half a dozen kings, more or less, seems a small thing in Egyptian history; but there are only six reigns between us and good Queen Anne, who flourished, as some believe, in the grey dawn of our civilization. If we then attempt to systematize our ideas, especially with reference to Egyptian art, through which alone the ancient days survive, and with which more than anything else the modern traveller has to do, we find that there are two or three distinct periods of which we hear frequently, while all the rest are forgotten. The age of the Pyramids comes to our notice first; but as we ascend the river we hear of it no more. The civilization of the fourth dynasty was great. We see it in the very first and finest monuments, as well as in the neighbouring tombs at Sakkarah. But after the Pyramids are past we come to a blank. What is known of the fifth dynasty, except that they ruled Egypt from Elephantine? Then comes a period of fable, unless we are willing to believe the stories of Nitocris and her slipper and Old Apupus and his nine cubits; and then there is night again for five more dynasties, during whose reign a period, according to Manetho, of four centuries and a half elapsed. The monuments are almost mute about them. The arts did not flourish under them. We talk of the Hyksos, or shepherd kings, but these five families were Egyptian. M. Mariette conjectures that Egypt was overrun by foreigners, and that the lists of kings are only those of the legitimate succession of the crown. Be this as it may, there is a gleam of light under the twelfth dynasty, that of the Osirtasens and Amenenthass; but during those four or five centuries, perhaps longer, Egypt was in obscurity, perhaps sunk in barbarism, the arts forgotten, and only a faint tradition of religion here and there preserved. Such a period in the life of a nation is sufficient to transform it altogether. The Egyptians under Osirtasen were not the same as the Egyptians who built the pyramids. We might as well ascribe Stonehenge and Salisbury Cathedral to the same period, and perhaps throw in St. Paul's and the new Houses of Parliament, as confuse the Pyramid builders with the architects of Medinet Aboo, or the Queen who reared the obelisk at Karnak with Cleopatra. With Osirtasen I. came a revival which lasted till the invasion of Cambyases, for the invasion of the Hyksos did not wholly interrupt the progress of civilization. It was one of them who brought Israel into Egypt, and under the family of Sethi, whose descendant Menephtah must have been the Pharaoh of the Exodus, Egypt attained her highest pitch of glory. Then followed the evil days of the Ethiopians and the Persians, and we have few monuments until the first Ptolemy came to Alexandria as the saviour of Egypt. If we care to pursue the alternate waxing and waning to our own day, it is easy to do so. The Arabs brought in a state of comparative civilization. There are mosques at Cairo and elsewhere of the ninth, and especially of the thirteenth, century quite worthy to compare with the architectural achievements of Ramesses and Ptolemy, and infinitely superior to them in architectural skill, as distinguished from mere brute force. Then follows the rule of the Turk, the oppression of the people, and the dark age of architecture and all the arts. The mosque of Mehmet Ali, with its stucco ornament and painted alabaster, bears the same relation to the mosque of Sultan Hassan that a Copt monastery bears to Dendera.

The great Ramesses reckoned back to Menes at This. The civilization under which Thebes and Memphis flourished was a revival, tentative at first and slow to improve, of what in the distant past had been the civilization of the Pyramid builders. The great monuments of Lower Egypt were there to tell men of the race which had preceded them on the same ground so many centuries

before. Probably there were priests and holy rites which had come down from the ancients of This. Probably there were genealogists to prove the identity of the races of Upper and Lower Egypt. But the gods changed with the men, and the worshippers of Osiris and Isis, of Pthah and Horus, of Amun and Chemi, of the Wolf and the Crocodile, were like sects or like rival orders of friars. Whether anything of the original This remained until the reign of Ramesses we know not. There are two temples, at the least, to be seen now; but they are both of his time. It is a pleasant excursion in the early spring, if a long one. Abydos is an out-of-the-way place. The river has left it high and dry. Perhaps it never flowed very near. But it is absurd to conjecture about what may have been five thousand years ago. Long as is the way, every enthusiastic traveller would see it, and ought to see it. Mariette and Murray, Bruch and Birch—in fact, all the authorities—say it must be visited. And so, rising up early, perhaps at Bellianeh, perhaps at Girgeh, the ass is saddled, the camel is laden, and we prepare to cross the intervening fields and spend a night in the temple of Sethi. "Crossing intervening fields" is a phrase which very imperfectly expresses the fatigues of the journey. The land of Egypt is here very wide. There are green crops everywhere—fresh with a greenness of which in England, even in Ireland, one knows nothing. There are flocks and herds in abundance, as of old, "even very much cattle," and at intervals the intense emerald colour is relieved by wide fields of corn in full ear where the reapers are at work, or immense tracts of beans in pod, or lupins as high as a man's head, or clover which conceals even the great carcasses of the buffalo. Here and there slingers, each like St. Simon Stylites on his pillar, alternate the business of a scarecrow with that of a cotton-spinner. Clothes are perhaps cheaper in Egypt than they were when Mr. Leighton painted his "Slinger," but, except in drawing water with the shadoof, few such statues of living bronze are to be seen. Another disappointment is equally bearable. We are accustomed to think of Egypt as a place devoid of flowers, as, in fact, the opposite of the "Flowery Land" with which it is so often compared. But in March, between Girgeh and Abydos, or, as the Arabs call it, Harabat, there is no lack of flowers. A great orchis, in particular, perfumes the air everywhere with a scent like vanilla, its tall spikes bearing white flowers gradually changing into sulphur colour at the top. The ground is starred with a little oxeye, a very good imitation of our own "weo, modest, crimson-tipped flower," and many another might be mentioned. As Abydos is reached, the sun begins to set, and the end of a four hours' ride in the afternoon leaves very little time for sight-seeing before the sudden darkness of the South comes down. A chamber of the Temple of Sethi has to be selected as a resting-place, carpets have to be spread, supper prepared and eaten, with an audience of natives, donkey boys, guides and sellers of *antikas*, looking on as at a royal feast. A similar interest is excited by the traveller's preparations for bed. But it is not hard to obtain moderate seclusion in one of the north-western chambers; and if the night is not too sultry, and the snoring of the Arabs too loud, the barking of the dogs too incessant, and the mock alarms of notorious robbers too well acted, a fair sleep may be obtained, with the ghostly forms of old Pharaohs looking down through the starlight, and the tall columns of the court casting long shadows across the floor and up to the gaunt figures on the wall. Camping in the temple would be more pleasant if the rubbish and dust were cleared away as it is at Edfon. The wall which contains the tablet is alone worth all the sculptures of Edfon; yet there a guardian looks after the temple, and gladly receives the small fee which the traveller as gladly pays. The sculptures are worthy of the most careful study. Much colour remains on them, and on the walls of the inner hall the highest style of Ramesian art has been employed. It is not often that the art of the same period presents so many differing degrees of excellence as does that of the reign of Ramesses II. At Gierf-Hossayn, for example, the acme of deformity and shapelessness is reached. At Bayt-el-Welly, not far off, on the other hand, there is some exquisite work. Here at This we have several kinds of sculpture in bas-relief side by side. In the outer hall it is coarse, heavily outlined, the figures being rounded within the outline, so as to give a false appearance of relief. This is the style in vogue in the later temples of the Ptolemaic time. In the second hall, however, a delicate low relief, which belongs only to the best work, covers the walls. Similar sculpture, but of a much earlier period, occurs in the tomb of Tih at Sakkarah, and a small example of it is, from its accessibility, well known to travellers, at Silestia. Some of the figures at Abydos are of enchanting beauty. Osiris sits attended by goddesses, each of them wearing on her face an expression of sublime happiness and tranquil dignity, while the King approaches humbly and offers a tribute of incense. Exquisite borders of flowers hem in each scene. Jewelry, in gold, gems, feathers, chains, breast-plates, crowns, bracelets of various kinds, dresses of elaborate patterns, the braiding of the hair—all are carefully depicted, and each no doubt was once in its proper tint, before the attacks of the "squeezers," who have, however, greatly spared Abydos. The traveller is also glad to miss the Italian and French names which disfigure so many temples, as well as the rarer, but even more offensive, names of Englishmen and Americans. John Smith and Thomas Jones are far outdone in Egypt by Giuseppe and Louis; even the famous Commission of Frenchmen under Champollion, and of Germans under Lepsius, having left vast records of their visits, and inscribed their names on wide expanses in Philæ and Karnak and wheresoever else they came.

TOWN AND COUNTRY MICE.

COUNTRY cousins, country mice, have perhaps at no period had quite fair play from the students of the vast and magical spectacle of human affairs. The original rural mouse in the fable, to be sure, had rather the better of the comparison; but that was because fables are bound to be moral, and to favour what may be called the crust-of-bread and hollow-tree theory of life. In spring the country cousin may be studied in his relations to his town kinsfolk, and in autumn another aspect of the question may be examined. On the whole, it seems that the rustic has only the worse of the contrast because he has seldom had the chance of drawing his own picture of the situation. The instruments of art have been given to the denizens of cities. *Excellens alii melius*, the small squire or the parson may quote—he generally remembers so much Latin—as he reads a satirical sketch of himself before he sets out to rule the parish, to regulate the diet of paupers, and to subdue the proud poacher. For a week in May he and his family are said by their satirists to enjoy themselves after their kind, and bring horror into the homes of their urban kindred. Town cousins have an idea that their spare bedrooms are a kind of sacred places, into which the rural tribe is always eager to intrude. When the rustics have filled all the available space in their friend's house they form a little colony in convenient lodgings and adjacent hotels. They have their own definite ideas of what they want to see and do, and they show wonderful staying power in the matter of amusements. They have learned a mischievous wisdom from journals which carry the talk and tattle of town into remote parts of Cornwall and Peeblesshire; they know all that there is to be seen, and they are determined to see it. The time was when the Tower and Madame Tussaud's and the Zoological Gardens—not on Sunday—are said to have comprised almost all the objects of rural curiosity. But of late it has been useless to speak of any of those really sterling attractions. The country cousin laughs at the British Museum, and is not to be inveigled into a good lonely place, like the National Gallery, where he can speak out loud and admire the paintings of deceased masters of the British school of Leslie and Uwins. He knows when there is to be a great sale in King Street, and you find him expressing his coarse admiration before "The Blue Moulded One," by a shy master whose works are never exhibited except at an auction. If you go down into the Horticultural Gardens at South Kensington, he is there—on a flower-show day, that is—among the broken chairs, the unweeded grass, the damp plaster statues, and the general grime of that curious desolation. The Horticultural Gardens, to be sure, on any day but this, would be an admirable resort for the country cousin, thinks the town cousin of satire: but it is embarrassing to meet him staring at the asparagus, the pots of sea-kale, the cabbages, and the royal and fashionable persons whom he has literally gone forth into the wilderness for to see.

In old caricatures country folk used to be represented in the act of parading Bond Street; men, women, and children in loose order, gazing at the shop-windows and the horses. But the town-bred satirist cannot complain any longer of this harmless simplicity. He is rather obliged to mourn the fact that his relatives know somewhat too much; that first nights and private views allure them; and that they have even shrewd ideas as to what days are likely to offer good comic spectacles at the House of Commons. They want to be admitted when Mr. Gladstone, as they have heard from a friend, is to be "drawn," or when an irresponsible independent member is to fire the train that communicates with some combustible question. Nor will the male country cousin any longer attach himself for the whole day long to his womenfolk. He has his own enjoyments, and is familiar with many odd haunts of which the innocent dwellers in cities are unaware. It is difficult to avoid the suspicion that he occasionally passes a day at a suburban meecourse while his wife and daughters go to the Crystal Palace. He knows more about rats and ratting than he chooses to tell, and possibly he is aware of the secret spot where some one's "novice" is to have a scientific rally with another sportsman's "old man." Pedestrianism has a charm for him, and so have the minor theatres, and during his week of dissipation he certainly manages to see a great deal of life and to be present at an immense number of incongruous places of amusement. As to his womenfolk, they do not disdain to improve their minds a little, and they make notes of the dress of passing members of their own sex, who certainly return the compliment and take stock of them, perhaps from other motives than the desire of instruction. The whole result is that the town cousins are puzzled, perplexed, find their usual routine of life broken up, and are driven violently from sport to sport by the rustic energy of their visitors. Their feelings are so strong that they have taken the shape of a grudging hospitality and a sarcastic mood. Townsfolk complain that the possession of a spare bedroom is a constant invitation to bores, and to people who only want to make use of them. With an unconscious humility, they seem never to dream that any one can wish to pass a week under their roof from love of them and enjoyment of their company. They grumble that to have a spare bedroom and to be hospitable means to keep an hotel without reward. People of this kind hold that their friends in the country look on their town house merely as a base of operations whence to sally forth and skirmish among shops, theatres, and picture-galleries. They have an uneasy sense, too, that they do not do enough for their guests; and, indeed, it is hard to provide amusements sufficient for country people so much more knowing and so much more impetuous than quiet townsfolk. London is so large and so full of attractions that it beguile a species

of humility in the hearts of its inhabitants. No one can want them for themselves, they think, when their acquaintance can be made so profitable, and when a visit to them offers so many pleasures in which their society is no necessary part. With all this humility goes the traditional sneer at the uncivilized natives of rustic parishes, and altogether the town cousin by no means makes the best of his kindred, and does not take them by the side which will best bear handling. By a natural inconsistency, he never reverses the situation in fancy, but always supposes that his own visits to the country are acts of pure beneficence towards the good people there.

This theory is the converse of the notion that country people only visit their friends in town for the sake of the external attractions of London. It is based on the notion that the fields and lanes, the hills and rivers, have no allurements, and that to go and stay with a country cousin implies a love of his society which overlooks the dulness of his neighbourhood. "People in the country are glad to see any one," people in town sometimes say; and there is some sort of truth in the remark, which attributes a good nature and hospitality to rustic folk that they by no means always find returned in town. To carry strangers on long drives through stony lanes to see abbeys, waterfalls, show places, ruins, is often at least as great a tax as are the demands of country cousins in London. Horses are the same kind of animals in Somerset as in Kensington, and so are coachmen, and just as difficult to mobilize. The bore of taking people through old familiar sights in the country is as great as the tedium of the same sort of duty in town. A man becomes weary of saying "Here Queen Margaret escaped by a postern gate," or "These are the pistols of Rob Roy Macgregor," especially when the weapons belong to some one else, and the postern gate is not on his own property. The country cousin at home, too, is sometimes haunted by the fear that his guests are bored, that they are making unfavourable comments on the weather—which certainly is generally execrable in the country—or that they are wearied to death by the rector and his wife. It is as difficult for country folk to believe that their cousins are more than satisfied with the fresh air, the trees, the abundance and naturalness of life as it is for town folk not to feel jealous of the attractions of town, not to fancy that it is for the sake of the park, and the theatres, and the picture-galleries, that their relations visit them.

Town and country cousins are most on a level when the latter have the command of sport—can give the former a mount, or a rod on a salmon river, or a few days with partridges and grouse. Yet even when these attractions are in the gift of the country cousin, he probably makes less of them to himself, and more of what liking may exist between himself and his kinsfolk, than the town cousin does of his own powers of giving amusement. Though men are more selfish in sport than in love, or money-making, or ambition, country people are more lavish with their offers of sport, and more ungrudging than town cousins are with their spare rooms and carriages. Rustic people are less easily annoyed, more healthy-minded, less disposed to quarrel with the petty inconveniences of a crowded house. Partly out of a traditional affliction, partly out of real fastidiousness, some town cousins are seriously vexed by the dress, the voices, the unaffected ignorance about some familiar things, of their country kin. One has seen the town mouse wince because the country mouse thought that etchings were pen-and-ink drawings, or because the innocent creature had never heard of M. Faure. The country cousin's boots, her bonnet, the fresh voices and healthy appetite for obvious pleasures, seem an offence to the town cousin's refinement. Of course, in cases like these, there lies at the bottom of the resentment the dread of being supposed to have connexions who are not quite "genteel," as people used to say once, or who are on a lower level of culture, as some persons might prefer to say now. Yet the country cousin whose town-bred relation insists on shooting though he is a hopelessly bad shot, and though in these days of breechloaders it is difficult to load his gun without lead, has much more reason to be ashamed of his visitor, and to dread his visits. What pang of the exquisitely refined equals the annoyance given by a guest who will fish, though the top of his rod, his line, and his flies fall with one dead splash upon the water, and frighten every trout above two inches long? Even more dire solecisms may be perpetrated in the hunting-field; and, in short, when town and country mouse are of different degrees of incomplete civilization they must suffer almost equally from the interchange of visits. In these cases the advantage, on the whole, does certainly lie with the rustic, who is the more hearty, the more hospitable of the two, and, like the Turk spoken of by Consul Holmes, "thinks it more dignified not to complain." Perhaps, like the same exemplary persons, he is not above taking revenge, and feels a certain hidden joy when he comes up to town to see his tailor and life for a fortnight, and to frighten his urban relations. But the most undying enmity, and a grudge never to be forgotten, is naturally borne by young women who stand to each other in the relation of town and country cousins. A bonnet may produce life-long acorn and detestation, and these gentle creatures sometimes scan each other with a minute and malignant criticism which detects rusticity on one side and conceit and patronage on the other. The moralist, beholding what man has made of man in this matter, and considering how many inextinguishable feuds the difference of town and country raises among people who might be so servicable to each other, will be confirmed in any favourite notions about life which he may happen to entertain.

THE MASTERSHIP OF ST. KATHARINE'S HOSPITAL.

AN ecclesiastical question of no slight importance calls for immediate decision in consequence of the death of the Hon. William Ashley, who was appointed by Queen Adelaide in 1839 to the Mastership of St. Katharine's Hospital. At the time of his appointment no doubt had arisen, or seemed likely to arise, as to the perfect regularity and fitness of the order under which he succeeded to a position vacated by the death of Sir Herbert Taylor, after having been held by a series of laymen for nearly three centuries. If, in the subsequent development of historical inquiry and of interest in ecclesiastical matters, this contented acquiescence in things as they were has given way to serious questioning and dissatisfaction, no thought of censure or adverse criticism has ever been associated with the name of the distinguished Christian gentleman who has now passed away from among us. No better appointment to the Mastership of St. Katharine's Hospital could have been made when this was made, nearly forty years ago; but during these forty years the whole system upon which the endowments of ecclesiastical bodies in the Church of England had been administered has been subjected to changes of vital moment, and the choice of Mr. Ashley's successor must be considered from the point of view which these changes afford. Mr. Ashley was a layman who held a spiritual preferment dating from 1148 as the head of a Collegiate Chapter in the Church of England, under the powers of an appointing instrument which, having been executed by the late Queen Dowager, does not appear among the records of the State Paper Office, but which may be presumed to have been identical in form with the patent granted to Sir Herbert Taylor, nominally by George III. after the death of Queen Charlotte, though of course really by his friend the Regent, and to have contained a dispensing clause, into the validity of which, when inserted in a patent not issuing from the Sovereign, it is needless to inquire, running as follows:—

We will . . . that he the said Herbert Taylor shall and may take have hold and possess the said office . . . although the said Herbert Taylor be not invested with priest's or any other sacred order . . . We will notwithstanding that Divine Worship and Altars and other works of piety of right to be done in the said Hospital or Free Chapel should in no manner of wise be neglected or omitted.

There can be no reasonable question that, if the ancient Collegiate Church of St. Katharine-near-the-Tower had still been standing as of old in the midst of the crowded population of its Precinct, the appointment of a lay Dean as head of the Chapter would, under the present circumstances of the English Church, be impossible; and we venture to hazard a somewhat decided opinion that such an appointment is impossible now. But the East London Collegiate Church was destroyed in 1825, and the whole Precinct of St. Katharine, with the exception of a few houses, was taken down to make way for the construction of the St. Katharine Docks. The entire property of the Precinct was sold to the Dock Company; the small population still left was transferred to the parochial charge of the incumbent of Aldgate; and a chapel, representing to some extent the old collegiate church, with residentiary houses annexed for the use of the Master and Chapter, was erected in the Regent's Park, where it is now a familiar object, though perhaps not one whose purpose is very easily understood. The ecclesiastical character of the Foundation was not, however, in the slightest particular affected by this change. Its very seal remained, and still remains, "S. Katharine juxta Turrim Lond."; and its spiritual jurisdiction as a Royal Peculiar, within its local Precinct, by virtue of which its Commissary granted marriage licences and probates of wills, has never been formally and specifically abolished. St. Katharine's Hospital is now, what it always has been, a collegiate church with its Chapter and ecclesiastical status, a distinct and venerable religious body in the Church of England. All its ancient landed estates are preserved in their integrity, with the single exception of the Precinct of the House itself, the purchase money of which is invested in the Funds. The revenues arising from these estates are those of a wealthy Foundation of the second rank; and though the old improvident system of leases on lives or for years, renewable by payment of fines, has not yet disappeared in its results, and the present income of the Hospital consequently does not represent its true rental, the leases are gradually running out, and before many years are past a considerably increased revenue—perhaps in all exceeding 12,000*l.* a year—will accrue to the Chapter. Certain minor sources of income once belonging to the Foundation have long since lapsed; and it is unnecessary to add that the Chantry and other like endowments attached to the Church of the Precinct went the way of all similar benefactions in the reign of Edward VI.; but, such as the estates of the House were before the reign of Henry VIII., such they are now, and such also are the members of the Chapter itself. These consist, as they consisted in the original foundation by Queen Matilda in 1148, and in the re-foundation by Queen Eleanor in 1273, of a Master and three Brothers, all priests, and three Sisters. Our readers will find the names of the ladies now members of the Chapter in their place under the head of "Collegiate Chapters" in the *Clergy List*; and whatever doubts may be entertained as to the continuity of the clerical or of any succession among the Brothers, there is no doubt, as we have shown in a former article, that the succession of the Sisters is unbroken throughout the whole period of more than seven hundred years.

The history of the Lay Mastership of this Collegiate Church is in

its main outlines very simple indeed. As soon as Henry VIII. was dead, the first Lay Master, Sir Thomas Seymour, was appointed by Queen Katharine Parr, and, losing his head within sight of his benefice, he was succeeded by Sir Francis Fleming, whose patent (3 Edw. VI. p. 2) contains the dispensing clause, "*licet ipse clericali ordine minime insignitus sed forsan uxoratus sit vel fuerit.*" Fleming was removed as a matter of course by Queen Mary in 1554, and Dr. Mallett, a priest and the Queen's Almoner, was appointed in his room. Mallett, in his turn, was ejected or forced to surrender the Mastership on the accession of Elizabeth, who, after a singular and abortive attempt to secularize completely the revenues of St. Katharine's by applying them to the ordinary expenses of the Tower, subject only to the maintenance of "*ii prestes to serve the cure,*" "*iii system,*" "*tenne pour women,*" and "*a clerke to serve the church,*" bestowed the Mastership of the Hospital on her secretary, Sir Thomas Wilson. This appointment was made in 1561, and the patent conferring it seems to have been an ordinary grant, containing no dispensing clause, but similar to that by which, in 1579, the Deanery of Durham was bestowed by the Queen on the same favoured lay servant. But a dispute arose in 1562 between Wilson and the City of London concerning the right of holding a fair on Tower Hill; and Wilson's patent proving to be invalid because he was not a priest, he surrendered it, and obtained a second patent, dated December 7, 1563, and containing a singularly explicit *non obstat* clause:—

Licet ipse idem Thomas Wilson laicus sit, ac clericali ordine minime insignitus, sed uxoratus, et conjugatus, ac etiam bigamus, ac alias benedictus, et non sacerdos.

From the days of Wilson to those of Mr. Ashley, every Master has been a layman, and every patent of appointment, so far as can be ascertained, has contained a dispensing clause, the same in effect, if differing in the details of its construction, as the closely hedged proviso which secured to Sir Thomas Wilson his Lay Deanery near the Tower. These clauses supply a continuous chain of evidence, if any such were needed, that the Mastership is still the spiritual office which the original rules of the Foundation and the later charters declared it to be. The extremely ingenious process by which Wilson managed to free himself, and, as a consequence, his successors, from the payment of first-fruits and tenths, may be read at length in an elaborate State paper, but is too intricate for further reference here. Nor is it necessary that we should trace the steps by which the Foundation, after the dissolution of the "College of St. Katharine" and the ransacking of the Collegiate Church with all its wealth of jewelled plate and magnificent vestments, of which an inventory is preserved, in 1545, was restored to its full complement of members in Chapter. It is sufficient to show that they were restored, and that the three brethren, priests, have now for two centuries been appointed according to the terms of the original foundation. That there was a period when the "brothers" had entirely disappeared, and a later period when they had reappeared, but were laymen and were not appointed by any Royal patroness or patron, might be shown to be more than probable; but for all practical purposes now it is enough that, with the exception of the Mastership, the whole capitular body has long been restored to the Church on its original lines, and that only the restoration of the headship as a spiritual office is wanting to render it formally complete. To what uses this venerable religious house should be adapted when it is complete is a larger question than we feel at liberty under existing circumstances to discuss.

But a very singular error is widely prevalent with respect to the character of this Foundation and the nature of the Royal patronage by which its capitular offices are conferred. It is not indeed matter for much surprise if the establishment in the Regent's Park looks very much as if it were a nest of sinecures, whose inmates could not be expected to do anything by reason of the absence of any visible occupation which might employ them. But this is simply an accident of the commercial necessities, urgent as they were then imagined to be, which led to the destruction of the ancient church and buildings of the Hospital in 1825. The half-century or so which has since elapsed is a mere parenthesis in the history of St. Katharine's; a period passed in the casual occupation of temporary lodgings. Yet a generation which never saw the ancient church, and knows little or nothing of the quiet corners of ecclesiastical history, may very naturally have fallen into the mistake to which we refer. It is supposed that St. Katharine's Hospital is a college of noble charity, a sort of aristocratic almshouse for the support by Royal bounty of certain well-born persons of moderate or narrow means. Now, under these conditions, it should have found its way into the *Clergy List* is not explained; probably because the fact is scarcely known. But there St. Katharine's Hospital actually is found, side by side with the collegiate churches of Westminster and Windsor.

The patronage of all the offices in the Chapter is and always has been vested in the Queens of England. When there is no Queen of England, the interim patronage is vested in the Sovereign; and at the risk of startling our readers, it is necessary to add that this was the case during the whole long reign of Queen Elizabeth, and is the case now. For when Queen Eleanor's charter reserved the patronage "*nobis et Regine Anglie nobis succedentibus,*" the "*Regine*" were meant to be Royal ladies of like condition with herself; and the Queen Consort has always retained as Queen Dowager the patronage of this Foundation for her life. Accordingly Queen Adelaide, and not the

Queen's Majesty, was the patroness who presented Mr. Ashley to the Mastership in 1839. But this ecclesiastical patronage is held subject to all the laws which govern presentations to other offices and benefices in the Church. The position of the Master, or quasi-Dean, and the Brothers of St. Katharine's is as distinctly spiritual by law, and their duties are as distinctly ecclesiastical, as those of the Dean and Canons of Westminster or Windsor, or of any cathedral church; and as we have not come to secularization and disestablishment at present, and have no intention of coming to such a pass at all, it may very confidently be predicted that in some way or other, and in some position suited to the growing needs of the growing and advancing Church of England, the future of this unique and noble Foundation, the Royal Hospital and Free Chapel of St. Katharine-near-the-Tower, will perpetuate in the ages to come the memories of its venerable past. Among the schemes for more adequately providing for the spiritual supervision of the metropolis, that of a suffragan to relieve the Bishop of London's work in East London is one of the simplest and most practical. An income for the post is the main difficulty, and this might be most congruously found by attaching the orders and duties of a Bishop to the Master of St. Katharine's.

SPRING AMONG THE NORTHERN STREAMS.

THE devotees of angling have decidedly an advantage over their fellow-mortals, in so far as their favourite pursuit supplies a never-failing object for their wanderings through the pleasantest months of the year. More especially is it so in the early spring-time. It is then that the country ought to seem most delightful; for, besides the first freshness of the opening year, one has all the pleasure of the contrast with the gloom of departing winter. Flashes of the most delicate green are spreading over the landscape; the birds, in the exhilaration of their reviving spirits, are singing in every brake and copse; and the streams from the hills which some weeks before were rolling in inky torrents through dreary patches of melting snow begin to ripple in translucent tints as they sparkle in the bursts of sunshine. But then the sunshine does come in bursts; the drifting clouds are apt to break upon you in drenching showers; now and again there blows up a storm that recalls the most relentless moods of the winter; while a fall in the temperature may chill you to the marrow, unless you keep the blood in circulation by violent exercise. So that spring excursions into the hills are rather too much of a lottery for most people. It may chance that the mere amateur of nature and her charms will be as much repelled by her wintry aspect as the lover is discomfited who surprises the object of his adoration when she is disfigured by the symptoms of a heavy cold in the head. It is more than miserable setting yourself down to sketch in a natural douche or shower-bath when the surface of the soil is a sheet of water, and each glen and hollow a palace of the winds. Though primroses and cowslips are in full bloom, it is too early for the botanist who prefers variety to beauty; the entomologist hunts in vain for curious specimens that are either dormant or still in embryo; and the geologist who is studying the testimony of the rocks, and puzzling out sermons or theories in the stones, may find it sloppy and slippery work scrambling over the schists and the granite. And even the trout-fisher would gladly compound for settled weather, since, setting the luxury of sunshine altogether out of the question, a superabundance of water from below and above is almost more injurious to his sport than too little. But then, at the worst, the earnest angler has all the consolations of hope; he is ready to take advantage of every change in his favour; and when things are going well with him, and the streams are in good order, he is amply repaid for expectations deferred; while constitutionally, and in virtue of his favourite tastes, he ought to be more indifferent to the weather than other people. Colds and coughs are not in the category of complaints to which he is liable; often, of course, rain is positively welcome to him, though doubtless he may easily have rather too much of it. His compact and well-selected wardrobe is thoroughly serviceable. The thick suit of rough grey tweed that blends so harmoniously with the bushes on the banks will fence out a bitter blast or throw off a heavy shower. His flexible but firmly-fitting felt hat, festooned by the casts of silk flies, lends no hold to the snatches of the wind. His easy, well-greased boots with their solid soles will keep him dry through any reasonable amount of damp. A long, light waterproof slung across the opposite shoulder to his creel completes his campaigning equipment; unless he care to draw on cumbersome fishing stockings rather than increase the risks of rheumatism from wading. His light luggage should contain a few well-selected volumes, the familiar companions of his frequent solitude. He likes them all the better that they are intimate friends; and in our opinion reading is never more agreeable than in the intervals of hard exercise sweetened by successful sport. If he has the knack of dressing his own flies, so much the better for him in more ways than one, should time threaten to hang heavy; and then your true angler, though he follows a solitary pursuit, is in nine cases out of ten of an eminently sociable disposition. No doubt angling may provoke to jealousy. It is annoying to find the water occupied on which you had set your hopes and affections; and it is more than flesh and blood can well bear to see some selfish churl hurrying along ahead of you, hastily whipping the cream off the pools which you meant to visit at your leisure. But, generally speaking, the kindly spirit of a common

brotherhood is in the ascendant. The local fishermen are disposed to give a friendly welcome to the civil-spoken stranger who consults their experience; and if you desire a companion at your evening meal, you may easily pick up one whose conversation will be profitable on the theme that is of inexhaustible interest to both parties.

Spring fishing is enjoyable anywhere; even in the tame pieces of carefully preserved water within an eighteenpenny fare of London. But naturally there is far more of picturesqueness and romance about it among the unfrequented streams of the wilder North. If the woodlands are less rich and the leaves later in coming out, the air blows fresher off the breezy moors, and there is infinitely more of variety in the landscape. The train has dropped you in some substantially built old-fashioned little town, lying locked in among hills that have almost the pretension to be called mountains. Thence you pursue your journey in a primitive coach, with a few hearty farmers and shepherds, and possibly a couple of cheery "commercial gentlemen" for your fellow-travellers. And these North-country bigmen, be it observed in passing, are by no means bad fellows, and are often excellent company; while you have every reason to be grateful to them as a body, since they keep up the standard of the cookery in the out-of-the-way inns. You drive out under an embattled archway, a memorial of the days of forays and border raids, and begin the ascent of the winding valley that leads up to the distant sources of the river, in the very heart of a labyrinth of hills. The little town once left behind, the country grows speedily more lonely. The solitary farmsteadings that dot the sides of the dale are fewer and further between. Then the arable land grows less as the hills close in and the soil becomes less kindly; while, on the other hand, the wealth of the prosperous owners displays itself more conspicuously in their flocks and herds. The slopes of the hills are covered with lambs gambolling round their sedate mothers, while a multitudinous sound of bleating shows that hundreds of hidden hollows are as populous as the ground you see. And, besides that bleating, in the way of music you have the rush of the river, which between each gently meandering reach in each stretch of strath goes hurrying down through archipelagoes of boulders, and flashing in foam over tiny waterfalls. Soon the thinner and scantier grass begins to roughen into the heather; and then the song of the missel-thrush and the twitter of the yellowhammer in the hedges is replaced by the shrill crow of the grouse. Finally, after having risen high out of sight and sound of the accompanying stream, you dip down rapidly again to rejoin it, in the brook where it barely leaves room for the village and for the snug little hostelry which is to be your present resting-place.

A stroll up the valley while dinner is getting ready makes you pray all the more devoutly for propitious weather on the morrow. The water is in excellent order, though possibly a little too full; but then it will run down in the next few hours, should there be no fall of rain in the meantime. And the next morning you are probably congratulating yourself; for though there is a promise of sunshine when the fog shall lift, yet a warm breeze is blowing from the west, and the day is likely to be far from cloudless. You cross the old grey bridge, with its steep single arch and the deep black pool below it, the pool effectually protected from your attentions by precipitous banks and the corpse of straggling timber with branches feathering to the water's edge. Indeed, for half a mile or so, further approach is well nigh impracticable; but afterwards you emerge into more open country, although every here and there are still patches of alder. Elsewhere, however, you can cast your flies to your heart's content. According as the hills close in or recede, the bordering meadow is broader or more narrow; there are tufts of thickly flowering primroses where it is dampest, and already it begins to be enameled with the summer crops of buttercups and daisies. The air is full of fragrance from the broom and gorse, which are covered with their masses of yellow blossom, backed up in the middle distance with expanses of brown heather. You breast a steady fall in the ground, and the little river flashes swiftly along in a tempting succession of pools and rushes and swirls of broken backwater. The water-courses are fitting from stone to stone; here and there in a sodgy corner the water-hens are leisurely swimming towards the cover, and every now and then you hear the plunge of a water-rat, and see the black head leaving the trail behind it, as he strikes out under water for the opposite bank. The larks are pouring down their choruses from overhead, and the linnets singing in the patches of broom. The cushet-doves that are the curse of the farmers in those parts are cooing from each neighbouring bit of cover. Occasionally the hoarse caw of a rook comes in not unmelodiously, as he wings his slow flight overhead; and more than once your silent approach scares a brother angler in the shape of a heron. As for game, although those half-highland domains are seldom so well stocked as estates in the lowland, you come upon many a pair of partridges holding loving converse on their nesting arrangements; and the rabbits, which burrow easily in that gravelly soil, are continually making a rush from their forms in the roots of the tufts of rushes. A walk of this kind must be a delight to any mortal; but, with the added excitement of a happy day's fishing, to the keen angler it becomes a thing to be remembered. In after seasons you can recall each incident—where you raised that trout under the drooping alder bough, and how you lost that other lively gentleman in the landing. Fortunately you are not fishing for blood or weight or prizes or against time. You have had ample leisure to look about you and enjoy yourself; and

as the sun is high towards afternoon and the sky clear, and the fish are ceasing to bite, you throw yourself on the bank after your labours with a clear conscience.

Nor is your day's pleasuring seriously marred should a change come over the weather. You may have watched the clouds from the west rolling up in vapoury masses, and heaping themselves in watery folds over the hill-tops, till they seemed to come sinking downwards under their own weight. The light breeze, after an ominous lull, has begun to whistle rather wildly, preparatory to really "getting up." The fish in their prescience of the coming storm have all of a sudden ceased to rise to you. Nor do you altogether regret it. For the sun is still making a struggle to show himself, and the lights are singularly grand and lurid. On one side everything is swathed in mist and vapour; on the other, a sharply-defined landscape is extraordinarily bright and clear, although the advancing dimness and the thickening shadows are fast encroaching on that luminous strip. By this time we may assume that you have buckled up your piscatory belongings and secured yourself in your mackintosh; for the dissolving rain-clouds are beginning to descend upon you, as they only can come down in the hills. But the odds are that your spirits are not dashed in the slightest by the down-pour as you walk homewards, doubling briskly, with the wind driving the sheets of water on your back. The air is so invigorating, in spite of the moisture, and the memories of the morning are still so bright to you. So that, even should it prove something more than a passing storm, you may possess yourself in patience till the abating of the floods; and these brusque transitions of an April in the uplands make your sojourn among them scarcely the less enjoyable.

THE TURF SWINDLE.

AN old nursery rhyme inculcates on children that
It is a sin to steal a pin,
Much more to steal a greater thing;

and, however questionable may be the morality of the latter part of this sentiment, there is no doubt that, so far as public interest and severity of punishment are concerned, offences against property are estimated very much according to the magnitude of the subject of the crime. To steal a countess's jewels is in law no greater crime than to filch a pewter pot from a public-house rail; to acquire 40,000*l.* by establishing a sham bank is technically the same offence as obtaining a sovereign by a mendacious begging letter; while to seek to oust the rightful owner from a large landed estate by perjury, and to cost the country 60,000*l.* in obtaining a conviction, is a misdemeanour precisely on the same footing as that of false swearing in a trumpery assault case before a magistrate. But the feeling towards the culprits in each class of cases is very different. In fact, since steam destroyed the romance of the road by abolishing the dashing and popular highwayman, the magnates of crime have been plutocrats rather than aristocrats, depending for fame on the magnitude of their undertakings more than on the daring of their exploits. And certainly among this plebeian class of malefactors Benson and his associates, recently convicted at the Old Bailey, are entitled to a proud pre-eminence; for it must not be supposed that the prosecutrix in this particular case was their only victim, or that the sum of 10,000*l.* and more extracted from her represented the total of the plunder amassed by this gang of consummate swindlers; the evidence went to show that they transacted business with an extensive connexion, and their gains must be taken to have been proportionately large. In fact, 40,000*l.* was hinted at as a moderate estimate of the partnership capital. Moreover, the fraud, if not novel in design, was so ingenious in form, so thoroughly and cleverly carried out, and the disclosures made in the course of the proceedings were so startling, that, apart from the mere money question, the case seems to call for some notice.

The principal offender, who, amongst numerous aliases, answered to the name of Benson, was not unknown to fame, though of course, by the rules of criminal procedure, nothing was disclosed as to his antecedents until after the jury had found their verdict. On a former occasion he has traded on the credulity and charity of human nature, as now on its credulity and cupidity. Some six years ago he boldly presented himself, under the character of the *Maire* of Châteaudun, to the civic authorities of London, who then had the management and distribution of the fund raised for the French sufferers by the war with Germany; and he procured no less than 1,000*l.* for the needs of his distressed peasantry, besides being treated with the greatest consideration and sympathy by the kindly dispensers of the national charity. On being arrested, either remorse at his abuse of their generosity or the anticipation of inevitable conviction drove him to make a determined attempt at suicide by setting fire to the furniture in his cell; but he survived the injuries thus received to undergo his sentence of a year's imprisonment. He now reappears on the criminal stage in league with certain kindred spirits, who had conceived a brilliant idea for turning to account the passion for sporting matters so rapidly spreading on the Continent. All our favourite national pastimes, the alien imitation of which appears so ludicrous to the British mind, are classed in France under the generic name of "*Le Sport*," and the first step taken by these crafty traders on foreign sporting propensities was to get a newspaper carefully concocted and printed in Edinburgh under the taking

title of *The Sport*. The only number of this interesting periodical which seems to have been issued bore the figures 1,713, thus indicating an old-established journal, and contained news more or less authentic on various racing topics, with a goodly array of sham advertisements; but the most important portion consisted of glowing encomiums on a Mr. Montgomery, described in a leading article as a pattern of uprightness and generosity, who by his marvellous knowledge of horse-flesh had amassed a colossal fortune on the Turf, and during the distress in Lancashire consequent on the American war had distinguished himself by collecting 1,600*l.* for the operatives at Tattenhall, investing that sum on his own risk on Hartington for the Cesarewitch, and thus increasing the amount handed over to the fund to 80,000*l.* The Edinburgh printer must have been strangely deficient in the astuteness with which his countrymen are credited; for, besides furnishing without hesitation the "curiosity of literature" above mentioned, he was also obliging enough to supply a number of printed and stamped cheques drawn on "The Royal Bank of London, Agar Chambers, Charing Cross"—a financial establishment which might easily have been ascertained to have about as much real existence as "The Bank of Elegance." The next manoeuvre was judiciously to disseminate copies of the paper so obtained in places where accurate information upon English sporting matters was not likely to have penetrated. Each copy was accompanied by a circular which set forth that the blameless Montgomery's unparalleled and invaluable success had rendered the bookmakers so shy of dealing with him that he found it impossible to obtain from them the current odds, whereby, instead of winning 736,500*l.* in the past year, he had only been able to realize 567,500*l.*, and that he was therefore desirous of establishing relations with persons abroad, who, for a consideration in the shape of commission, would disarm suspicion by acting as intermediaries in the deposit of his stakes and the receipt of his infallible winnings. A foreign Directory subsequently discovered at the head-quarters of the gang clearly enough indicated the means of information which procured for the Countess Marie Cécile de Goncourt, a widow lady residing at Chateau Goncourt in the department of the Marne, the distinguished honour of receiving gratis a copy of *The Sport* and its attendant circular. Unprotected females, whether widows or orphans, have always shared with clergymen and retired officers the reputation of affording the easiest prey to swindlers who offer large interest on small capitals; and the present case was no exception to the rule. The bait took, and a correspondence ensued, as a result of which Mme. de Goncourt undertook to assist Mr. Montgomery in the way suggested. Forthwith transactions on a gigantic scale were entered upon between Mr. Montgomery on the one hand and Mr. Francis, a "sworn bookmaker," on the other, though what the latter had sworn to do or not to do was left unexplained. All these negotiations were carried on through the medium of Mme. de Goncourt and the cheques on the Royal Bank of London, these documents being filled up for fabulous amounts to represent Mr. Montgomery's investments, and to still larger amounts to represent his returned stakes and winnings. It is perhaps unnecessary to state that the *roles* of Mr. Montgomery, or, as he called himself in signing the cheques, for the purpose of concealing his identity from those with whom he made the bets, George Simpson, and the "sworn bookmaker" were ably sustained throughout by Benson and one or more of his associates.

So profitable did Mr. Montgomery's speculations appear to be that Mme. de Goncourt soon got tired of being, in legal phrase, a mere conduit-pipe, and desired to divert a portion of the golden stream so constantly and largely flowing through her hands. The commission appears to have been left to accumulate, and we next find the unsuspecting lady entrusting Mr. Francis, on the advice of Mr. Montgomery, with the sum of 800*l.*, to be invested on a certain horse about to run at Doncaster. And now began a series of false representations made with the view of inducing Mme. de Goncourt to increase her stakes, the bare statement of which may raise a feeling of astonishment that any one could be so guileless as to credit them. But the hearing the letters read in court tended materially to diminish this feeling. The reasons alleged were, to a person wholly unacquainted with racing matters, so plausible, Mme. de Goncourt's correspondents appeared so disinterestedly solicitous for her welfare, their own fortunes seemed so intimately bound up with hers, and her hopes and fears alternately were so cunningly worked on, that, without attributing to the lady that greed of gain with which she was stigmatized by some of the counsel for the defence, one can easily conceive the state of mind in which she allowed herself to be plundered.

First, the stakes arrived at a time when the sworn bookmaker's register was closed against any commission under 2,000*l.* Then a mysterious character called "an insurance bookmaker" appeared on the scene, who guaranteed against loss, but would not condescend to deal with a less sum than 4,000*l.*, and an indemnity had to be paid to the sworn bookmaker on the transfer of custom from him to the insurance bookmaker. Then the owner of the steed which bore Mme. de Goncourt's fortunes withdrew him from competition at Doncaster and entered him for the Ayr Meeting, with enhanced chances of success, but where unfortunately no insured bet could be for less than 5,000*l.*, which sum was ultimately raised on Mr. Montgomery's glowing representations to the total of 10,000*l.* But, while both parties were thus hasting to be rich, Benson and his friends committed an indiscretion which, without disrespect to Mme. de Goncourt, we must characterize as equivalent to killing the golden goose. Emboldened by their previous suc-

cesses, they applied to her for 30,000*l.*, on the ground that they had received private intimation that, of seven horses entered for the particular race at Ayr, six had been scratched, leaving the one they had selected sole possessor of the field, and therefore the certain winner in a walk over. Mme. de Goncourt, relieved of all anxiety and eager to make her fortune by one grand coup, at once set herself to work to raise the necessary sum. This, however, necessitated a visit to her bankers; they referred her to her notary, and the murder was out. Our conception of notaries, mainly derived from the operatic stage, where one of these gentlemen frequently appears in the last act in conjunction with a small table and a large sheet of parchment to supply the legal sanction to the bliss of the hero and heroine, does not suggest a class of persons likely to be conversant with sporting matters; but this particular notary clearly had the wit to see that something was wrong, and he speedily put himself in communication with his English brethren, with the happy result of ultimately bringing Benson and his four friends to the Central Criminal Court, and of restoring to Mme. de Goncourt all but a fraction of that money from which she had been parted on the easy and expeditious terms recognized by a proverb which it would be discourteous to apply to a lady.

But, with prisoners as with hares, though the first thing is to catch them, the cooking is not always an easy matter, and the defensive tactics of Benson and Co., no less carefully planned and carried out than their audacious system of attack, threw many obstacles in the way of the prosecution, and procured the jury the pleasure of one another's uninterrupted society for twelve days and eleven nights. For precautions had been taken to change the proceeds of the fraud as soon as received into Scotch notes, the numbers of which it seems to be not customary with bankers to copy, and which are therefore difficult to trace; while the frequent changes of name and abode adopted by the accused rendered each as difficult of identification as the traditional pig which ran about so that he could not be counted. Moreover, there was reason to believe that attempts, not altogether unsuccessful, had been made to tamper with some at least of the warders of Newgate, so as to enable the prisoners, while in confinement, to concert measures for their defence—a matter which, in common with Mr. Baron Huddleston, we sincerely trust will be made the subject of searching inquiry. Documents found on the prisoners, and possibly originating in this freedom of intercommunication, materially aided the proof of the case, and now they have received the due reward of their deeds in the form of various terms of penal servitude and one of imprisonment. We have not cared to distinguish minutely the particular part taken by each in the perpetration of the offence; but the measure of punishment allotted to each represents fairly enough his complicity in the matter, though the whole scale of retributive justice seems to have been fixed somewhat lower than would have been warranted by the facts of the case, perhaps in deference to a plea for mercy which Mme. de Goncourt, with true womanly forgiveness, addressed to the Bench after the verdict was returned.

The charges in the indictment included forgery of the cheques on "the Royal Bank of London," the uttering the same well knowing them to be forged, and the obtaining 10,000*l.* from Mme. de Goncourt by false pretences and conspiracy; but the verdict and sentence proceeded upon the first of these only. This was perhaps fortunate, as precluding the possibility of future proceedings. The forging of an imaginary person's name is of course as much an offence as forging the name of a living man; but some of the prisoners, having been extradited from Holland, and the treaty with that country not providing for the extradition of persons charged with uttering forged documents, but only of those charged with forgery or participation in forgery, similar questions to those raised in Winslow's case might have interfered with the speedy and final punishment of Benson and his friends, had not the jury found them guilty on the principal charge.

We are painfully conscious of having done but scant justice to the ingenuity of the convicts by the necessary omission of many of the subtler details of the case—such, for instance, as the delicate manner in which Mr. Montgomery first stimulated Mme. de Goncourt's betting tendencies by magnanimously suggesting that he should not consider it a breach of confidence if she availed herself of the valuable information necessarily coming to her in the course of the transactions on his behalf; his consummate appeal to her sympathies on the ground of himself possessing children and a wife, who was a model of discretion, which, in truth, as the Solicitor-General dryly remarked, she was, seeing that no such person existed; or, again, the tact with which the communications from the sworn and insurance bookmakers were uniformly addressed to M., not Mme., de Goncourt, Mr. Montgomery having, on his own statement, acted with such gentlemanly consideration as not to disclose the sex and rank of his distinguished client to those to whom he introduced her affairs.

And so ends this serio-comedy. The too confiding Mme. de Goncourt returns home rejoicing with her recovered money and the expenses of her trip to that Albion which she will henceforth regard as more than ever *perfidie*; while Benson, Hale, and the two Kerrs enter upon their dreary terms of penal servitude, which the affluence and ease of their recent existence will render at first particularly terrible. Murray has a comparatively short period of imprisonment apportioned to him, but he will find the hard labour which accompanies his sentence a sufficiently severe punishment to induce him to think well on his release before again casting in

his lot with persons engaged in such dubious pursuits as his late associates. The principal felon, Benson, mentioned in a letter to his father, which was found on him, that he prayed morning, noon, and night, and we trust that the consolations of religion may support him under his present somewhat trying circumstances; but there irresistibly occurs to the mind a certain text relative to a class of persons who "devour widows' houses, and for a pretence make long prayers," which his antecedents render but too pertinent, and which justifies us in an uncharitable doubt as to the sincerity of his professions.

ROYAL NUMERALS.

WE lighted the other day in Mr. R. B. Smith's Lectures on "Mohammed and Mohammedanism" on the following curious passage:—

People call the conqueror of Constantinople, eight hundred years later, Mohammed the Second. But I do not think they ever speak of the Prophet as Mohammed the First; and perhaps the unconscious homage thus rendered to him by a world which ostensibly, and till very lately, did him such scant justice is the highest tribute that can be given to his greatness.

A malicious reader ventured to parody Mr. Smith's reckoning by saying that "people call the King of England who began to reign in 1727 George the Second, but that they do not ever speak of the patron saint of England as George the First." It is certainly odd if Mr. Smith never heard of Sultan Mahomet the First, who, if not a man quite on the scale of his grandson, fills no unimportant place in Ottoman history. But it does certainly sound as if the panegyrist of the Prophet fancied that, as Napoleon the Third was Third without any Second, so Mahomet the Second was Second without any First. Some ingenious maker of Latin verses might parody the lines of Horace—

Unde nil majus generator ipso,
Nec viget quidquam simile aut secundum—

in favour of the man whose greatness was the other way, and consisted, not in having no children to be second after him, but in having no fathers to be first before him. The whole thing becomes yet more funny when we look a few pages back and find Mr. Smith quite aware of the existence of Sultan Mahomet the Fourth, which suggests that, on Mr. Smith's reckoning, the odd Mahomet is, perhaps by some unconscious form of homage, left out. Mahomet the Second was really great enough—*μεγαλοπράγμων τε καὶ κακοπράγμων*—to count as two, like the "very fat lord" whose vote, counted as ten, gave us the Habeas Corpus Act. But one hardly sees why such a privilege should be extended to Mahomet the Fourth. Still, if Mr. Smith chooses to count his Sultans in alternate rows, like the houses in some London streets, it does not concern us. His numeration has set us on a little train of thought, and so far we thank him.

There is certainly something remarkable in the way in which, while some kings are best known by some surname or nickname, in the case of others the mere numeral has itself become a kind of surname. It is like some of the great dates of history, where the mere number of the year becomes clothed with a kind of living being, and the mere figures call up the picture of some great event with its long train of causes and consequences. If we speak of Charles the First, Charles the Fifth, Charles the Twelfth, there is no need to explain that we mean the First of England, the Fifth of the Empire, and the Twelfth of Sweden. The names speak for themselves, even though there was nothing to point out of what line of sovereigns we were speaking. A picture of Charles the Fifth, a coin of Charles the Fifth, if mentioned in the most casual way, would convey to every one the notion of the Emperor, not of Charles the Fifth of France or of any other country that may number five Charleses. There are to be sure exceptions to every rule, and we can remember how, when a question was set in the Oxford Schools, "Give notices of the city of Rome from Charles the Great to Charles the Fifth," a candidate came and asked his examiner whether the Charles the Fifth that was meant was the Emperor or the King of France. As the Emperor certainly had something to do with the city of Rome and the King of France had certainly nothing, the doubt can be set down only as one of those singular instances of perversity which we do light on ever and anon. Charles the Fifth the Emperor is so completely Charles the Fifth that people seem sometimes amazed to find that he was not numerically Charles the Fifth in all his dominions. We have seen him spoken of as Charles the Fifth of Spain. With this reckoning, the description of a later King of Spain as Charles the Second must seem as mysterious from the other side as the description of Mahomet the Second seemed to Mr. Smith. Charles the Fifth is so completely and exclusively Charles the Fifth, that in French he has a form to himself shared with him by no other Emperor or King, but only by a single Pope. The Emperor who is most famous for the Golden Bull is "Charles Quatre," the Emperor who is most famous for the Pragmatic Sanction is "Charles Six"; but their more famous namesake who comes between them is "Charles-Quint," balanced by the no less renowned Pontiff "Sixte-Quint." The two most famous Emperors of the name have, in short, had the one his surname, the other his number, tacked on to his name, and it only needs one step further to write "Charlesquint" to match "Charlemagne." The number in this case, though it is a mere number and in itself simply records the

fact that four Emperors before him had borne the same name, is in effect a surname. Charles the Fifth stands out as a description with a meaning. But many people might have to stop and think who Charles the Fourth, Charles the Sixth, and Charles the Seventh were; and Charles the First, Charles the Second, and Charles the Third are so universally spoken of by surnames or nicknames that no one would know without a moment's thought who was meant by either of those numerals.

Charles the Twelfth again is almost as famous as Charles the Fifth, and his name is doubtless familiar to many who would have to guess that there must have been a Charles the Eleventh, and that there may have been a Thirteenth, Fourteenth, and Fifteenth. But among the Swedish Kings the process of guessing backwards would be a little dangerous. It is safe to guess a Charles the Eleventh, a Charles the Tenth, a Charles the Eighth, and a Charles the Seventh. But he who shall rashly go on to guess a Charles the Sixth, still more he who shall dream of a northern "Charles-Quint," will find himself plunged in a quagmire of difficulties and complications. In any ordinary list of Kings of Sweden the Charleses begin with Charles the Seventh. This fact would exactly suit Mr. Smith. It must have been more than an unconscious homage which should start a man after this mystical fashion with the sacred and sabbatical number; but it is a grave fact that Charles the Twelfth is Charles the Twelfth only by a reckoning of Charleses the first of whom is placed at some unfixed date between the year of the world 2045 and the year of the world 2704. Between those dates, and before Odin, reigned Charles the First. In one famous legend the first Karl, together with the first Smith, were both called into being by a special exercise of the creative power of Odin; but here Odin himself is less ancient than Karl. Our English fashion has rather gone the other way; we have dropped our royal reckoning of kings whom we might fairly have counted. The first Edward after the Conquest was in his own days called Edward the Fourth; and the first Charles Stewart might with more reason have been called Charles the Second, on the strength of Ceolric King of the West Saxons, than the real Charles the Sixth of Sweden was called Charles the Twelfth on the strength of six doubtful or imaginary Karls, one of whom came before Odin.

Frederick the Second again is an Emperor who stands out by his number quite as distinctly as if he had any descriptive surname. He was indeed "Stupor Mundi," as Otto the Third had been "Mirabile Mundi"; but the name has not stuck to him as the red beard of his grandfather has stuck to him in all tongues. Still there is all the difference in the world between Frederick the Second and Frederick the Third. This last Emperor the world seems pretty well agreed to set down as No. 3, though there is sometimes a certain wish in Austrian quarters to make him No. 4 on the strength of that Frederick of Austria who disputed the crown with Lewis of Bavaria. The Ottos again are always counted from the first Saxon King of the name, though there were not wanting some who were anxious to reckon Otto the Great as "Otto the Second," on the strength of Marcus Salvius Otho. Such a way of reckoning might have given Mr. Smith further ground for musing. But the gap which this reckoning makes between the first and the second Otto is only a few centuries wider than the gap which separates the first and the second Tiberius. This last reckoning again can hardly be justified for the Emperor who is commonly called Claudius was just as much Tiberius as his uncle, and we dare say that we might find others if we were to look through all the Imperial *prænomina*.

But the names and numbers which we would specially commend to Mr. Smith's care are those of the Philips, whether of Macedonia, France, or Spain. Nobody doubts for a moment who is meant if we speak of Philip the Second; it is he of Spain and nobody else. The French Philips are so well provided for by nicknames that we almost forget their numbers. It would take a little thought, if we heard of Philip the Second and Philip the Fifth, to see that the princes meant were those who are so familiar by the names of Philip Augustus and Philip the Fair. But Philip the Second might have started Mr. Smith's difficulties with much better reason than Mahomet the Second. It is much easier in reading Spanish history to forget that there was a Philip the First than to forget in reading Ottoman history that there was a Mahomet the First. Charles the Fifth seems at first sight to be all aunts and grandfathers, without any parents. His father died so soon, and his mother was so long before she died, that both seem to pass out of sight. One is sometimes really tempted to ask whether there ever was a Philip the First. If, by any good chance, the patron saint of Spain had been St. Philip and not St. James, we might easily be driven to Mr. Smith's theory, and conceive that the ultra-Catholic King was No. 2, the saint himself being No. 1. There are, we believe, some very scrupulous people who speak of the John of France who was taken at Poitiers as John the Second, on the strength of a little John whose life was so very short that he might easily be forgotten. But as there never was a John the Third, the question as to his number became of no practical importance; otherwise, if John of Valois lived on in history as John the Second, we might easily be driven to seek for John the First, as we may easily be driven to seek for our first Philip, and as Mr. Smith is driven to seek for his first Mahomet.

Lastly, there are those princes who have different numbers in different parts of their dominions. We have already spoken of the difficulties arising from the Emperor Charles the Fifth being also Charles the First of Castile; and we certainly would not undertake to say offhand what was his number in each of his endless kingdoms,

and duchies, and counties. To say nothing of the Henries of Reuss, who are beyond us, the Imperial Henries sometimes get a little puzzling on account of the difference in the German and Italian reckoning. The Germans naturally count, and the Italians as naturally leave out, the first Henry of Saxony, whom we used to call Henry the Fowler, till we lately had orders from his own duchy to call him so no longer. In our own country, when the late King came to the crown, some ingenious person remarked with perfect truth that he was William the First of Hanover, William the Second of Ireland, William the Third of Scotland, and William the Fourth of England. The ingenious reckoner did not go on to add that in the islands of Guernsey, Jersey, Alderney, Sark, and a few still smaller, he was undoubtedly William the Fifth Duke of the Normans. So the William last before him was no less plainly First of Ireland, Second of Scotland, Third of England, Fourth of Normandy, and Tenth of Orange. To be sure the Orange reckoning is not quite undoubted. The Princes of Orange are reckoned in more ways than one; but the one who is common to Orange and England was the Tenth according to one reckoning, and it is the number that sounds best. And the Princes of Orange have one advantage; a piece, perhaps not of genuine history, but at least of genuine legend, provides them with a saint as their first William. But the difference of reckoning among his successors would seem to show that there were some among the genealogists of the House of Orange who felt towards William the Saint as Mr. Smith feels towards Mahomet the Prophet, and who from an unconscious feeling of reverence shrank from speaking of him as William the First.

THE LORDS' COMMITTEE ON INTemperance.

THE Lords' Committee on Intemperance have made a first Report containing the evidence taken up to Easter. The witnesses examined were chiefly from Liverpool, Manchester, and Birmingham, and those who care to go into the question in detail will find a large body of statistics relating to the drunkenness of these three towns. The Gothenburg system, which will be found set out with great fulness in Mr. Chamberlain's evidence, has been so lately under discussion in Parliament that nothing need be said about it here. The point of most interest in the evidence of the Liverpool and Manchester witnesses is the comparative merits of free licensing and restriction. Mr. Samuel Rathbone is the principal advocate of the former system, and Mr. J. A. Brenner of the latter. It is to be noted that Mr. Rathbone was one of the magistrates who were most strongly opposed to free licensing when it was actually introduced in Liverpool. The experiment had been tried in the first instance at the will of a very small majority of the magistrates; and, as soon as the composition of the bench was altered, it was abandoned at the will of another small majority. Mr. Rathbone says that free licensing was favoured by some of the older and more experienced magistrates, and opposed by younger men on grounds which were mainly theoretical. He himself did his best to get it abolished, partly because he disliked to see the Liverpool bench administering the law in direct opposition to all the other licensing justices in the country, and partly because he was led away by the statement that there is a direct relation between the number of public-houses and the amount of drunkenness. He has since convinced himself that no such connexion exists. Whether he is right or wrong on this point we will not undertake to say, for the simple reason that it seems very doubtful whether the statistics that are forthcoming on this part of the subject point to any precise or uniform conclusion. There are so many causes which may contribute to the increase or decrease of drunkenness in any given year or in any given district, and, so long as the amount of drunkenness can only be measured by the number of persons convicted, there is no certainty whether there is really more drunkenness or only a more prompt detection of what drunkenness there is. Consequently the attempt to prove either conclusion by figures must for the present be abandoned as hopeless. The defence of free licensing must be conducted on other lines, and when so conducted it will be seen to have very great advantages over its rival.

It is necessary to understand at the outset what it is that we hope to effect by special legislation on the liquor traffic. In the first place, the object of legislation is not to stop drinking. That is a matter with which neither Parliament nor magistrates have any concern. A man has as much right to drink a pot of beer or a glass of spirits as he has to eat a mutton chop. Between those who hold this view and prohibitionists of every school there is a great gulf fixed. In the second place, the object of legislation is not to stop drunkenness as such. It is a very lamentable thing that a man should muddle away his time, his brains, and his money in the public-house; but it is equally lamentable that he should muddle away his time and money in a billiard-saloon or his brains in a music-hall. It is not the business of Parliament to ensure that men lead sober and industrious lives. You can no more make men useful by Act of Parliament than you can make them virtuous by Act of Parliament. Drunkenness, however, differs from most other vices in this—that it is provocative of a great amount of disorder, and very often of positive crime. In so far as it leads to one or the other, Parliament has a right to deal with it. Just as there are many actions which in themselves might be harmless but which become hurtful because, if permitted, they would lead to a breach of the peace; so

drunkenness, which in itself is harmless except to the drunkard, becomes hurtful by reason of the consequences to which it is constantly found to lead. As a matter of police regulation, therefore, it is within the competence of Parliament to punish drunkenness whenever the connexion between it and either disorder or crime is sufficiently visible. This is the justification of affixing a penalty to drunkenness in a public highway. It is found as a matter of experience that, under these circumstances, drunkenness is exceedingly provocative of disorder; and when this chain of cause and effect has been established, there is no need to wait until the effect has been produced in a particular instance. A man who is found drunk in the street has no right to plead that he did not know he was doing any harm. So much harm has come from this cause that Parliament is only embodying the common sense of the community in a law when it makes drunkenness under these circumstances a legal offence. Further than this, the conditions of the retail trade in liquor are sufficiently exceptional to justify exceptional legislation. In other trades the evil that is done by tempting a man to spend too much money is not necessarily visible to the trader. A woman may impoverish her husband by buying too many or too fine clothes, or a man may ruin his family by buying pictures. But the milliner or the picture-dealer may, and probably does, know nothing about the income of his customer; and the question whether such or such an outlay is or is not extravagant altogether depends on this fact. But the publican who supplies liquor to a drunken man knows perfectly well what he is doing; and the Legislature may fairly say to him, you shall not be allowed to make money by bringing your customers into a state in which they will probably be disorderly, and possibly go on from disorder to crime. Nor shall you be allowed to ply your trade in ways which have been proved to have a special tendency to produce these mischiefs. This much of independence you must surrender in deference to the needs of public order and good government, and in consideration of the money you can make with the amount of independence that is left you. The hours during which you are allowed to keep your shop open must be regulated; you must give free entrance to the police whenever they wish to satisfy themselves that you are not doing anything in violation of the law; and if you in any way minister to drunkenness, as distinct from drinking, you must take the consequences.

These seem to be the limits within which Parliament can usefully interfere with the liquor traffic, and it will be seen that there is not one of them which is not satisfied by a well-arranged plan of free licensing. More than this, there is not one of them which is not satisfied more completely by a system of free licensing than by any other. The object of the restrictive systems, the systems, that is, which regulate the number of public-houses either with reference to the number of the inhabitants, or to the density of the population, or to the wishes of the ratepayers, or to the judgment of the magistrates—is to diminish opportunities for drinking. Of course, if these opportunities are reduced below a certain degree of frequency, to get drunk in a public-house becomes a matter of more or less physical difficulty. But, unless this process of reduction is carried so far as to be almost undistinguishable from prohibition, there is no evidence that it does diminish drunkenness. The man who takes pleasure in getting drunk will make considerable sacrifices to get his pleasure. If there were only one public-house to every mile of street, it is the people who drink because they are thirsty that would suffer. The man who drinks because he likes to get drunk would cheerfully go the extra distance rather than be deprived of his enjoyment. Under the free licensing system the same or heavier penalties could be imposed on drunkenness, the same regulations could be made as to the hours during which public-houses shall be open, the same punishment could be inflicted on the publican in the event of his supplying liquor to men already drunk. And, as a matter of fact, these things, which are done after a fashion under the restrictive system, would be done very much more perfectly under a system of free licensing. At present the publican's trade is in the nature of a monopoly—not of course a very strict or assured monopoly, but a monopoly all the same. Almost everywhere the magistrates take into account the number of public-houses already existing in a district in deciding on applications for new licences, and inasmuch as this necessarily operates in some degree as a protection against competition, it converts the existing licences into property. It is only human nature that a magistrate should give some weight to this fact when the owner of a licence is charged with breaking the law. The punishment which he must inflict, if he is to carry out the intention of the Act of Parliament, is really a much greater punishment than he thinks the case demands. The forfeiture of a licence, which follows as a matter of course after a certain number of convictions have been endorsed on it, is a confiscation of a valuable property, in which the erring publican has perhaps invested a considerable sum of money, or which belongs to another person who is no way responsible for the publican's sins. Consequently the magistrate deals with the publican in a different spirit from that in which he would deal with a grocer or a baker, and the trade which the law meant to be treated with exceptional severity is really treated with exceptional leniency. Nor is this the only ill result of a system which makes a licence property. The more a man has to fight for, the harder, usually speaking, will he fight, and the method by which a publican fights is usually subornation of witnesses. The Liverpool police, Mr. Rathbone says, are often deterred from proceeding against a publican by the knowledge that

he will probably escape by a free recourse to perjury. If it were only on this ground that failure was to be apprehended, they might be ready to take their chance; but when this prospect is added to the probable unwillingness of the magistrate to convict, the risk is greater than they care to incur.

FIRES IN THEATRES.

THE Select Committee of the House of Commons which was appointed last year to inquire into the constitution and efficiency of the Metropolitan Fire Brigade, and the most effective means of providing further security from loss of life and property by fire, has so far accomplished its task that it has produced a bulky Blue-book containing the evidence taken as to the working of the Brigade, and the general arrangements made for the protection of London in regard to fires, and has now entered upon another branch of the subject—that relating to the precautions which are required in buildings of a special class and exposed to peculiar dangers, such as theatres, music-halls, and other places of public amusement. Some time will no doubt elapse before the evidence on this question is printed in full; but in the meantime the summaries of it which have appeared in the newspapers are sufficient to show what the present system of supervision amounts to, and the direction in which a change would seem to be necessary. Before dealing with the information thus supplied, which relates exclusively to the present state of things, it may be worth while briefly to explain the authority which the Lord Chamberlain of the Royal Household—who is not to be confounded with the hereditary Lord Great Chamberlain who has charge of the Houses of Parliament—exercises over the theatres. In the first instance it was derived from the royal prerogative, but it has in later times been defined by a couple of statutes—the 10 George II. (1737) and the 6 & 7 Victoria (1843). The latter Act, which is still in force, provides that the Lord Chamberlain for the time being is empowered to grant licences for theatres within the limits of the metropolis, and wherever there is a royal residence, and to have a certain jurisdiction over these establishments. Thus a theatre cannot be opened without a licence from this functionary; and it is a condition of the grant of one that the manager shall be bound to “duly and regularly observe, perform, and obey the rules which shall be in force at any time during the currency of the licence for the regulation of such theatre, and that he shall provide personal security and two sureties to a certain amount for securing payment of any penalties which such manager may be adjudged to pay for breach of the said rules or any of the provisions of the said Act.” By the eighth clause of the Act the Lord Chamberlain has power to suspend a licence for such time as he shall see fit. The jurisdiction which was thus established was at first chiefly confined to the censorship of plays, but has now been extended to the construction and fittings of theatres; and it is with the latter only that we are now concerned. In the memorandum in reference to Mr. Donne's appointment as Inspector of Theatres, the Lord Chamberlain of that day remarks that his “attention has been directed to the improvement of theatres, especially as regards a proper space being afforded to the public, not only in the boxes, but more particularly in the pit and galleries, with a view to ensuring by such arrangements increased comfort, order, and decency, and also as regards a more perfect system of lighting and ventilation, security from fire, and an easy egress in the case of a sudden panic”; and therefore he directs the Inspector to look after these things. It will be thus seen that the Lord Chamberlain's authority over the theatres has a wide range, and is clearly intended to be exercised, not in mere formal admonitions to managers, but as a means of real and practical control; and it is to be hoped that this elementary point will be found clearly set forth in the supplementary Blue-book when it appears, inasmuch as it settles the question of the Lord Chamberlain's legal powers.

Such, then, being the nature of the office, we turn to the evidence of the officials for an account of the manner in which its duties are discharged. Mr. S. O. Ponsonby Fane, who holds the position of Controller in this department, with which he has been connected for twenty years, and who has personally inspected all the theatres, thus describes the process of inspection:—“Prior to licensing-day, the 19th of September, witness, accompanied by a professional surveyor, visited the different theatres for the purpose of inspection. They went from cellar to garret, and carefully inspected the condition of the doors, the state of the gas-fittings, the chandeliers, the cellars, and the water supply. The inspections always took place in the day-time, when the theatres were empty. He had visited the theatres at night when they were full, but of course no regular inspection could take place then.” As a general description of the way in which the inspection is performed, this no doubt seems to show that it is done in a thorough and careful manner; but when we look into details we get a little more light on the subject. For example, Mr. Fane expresses a decided opinion that “the measures taken to prevent fire and to secure the egress of the audience in the event of an alarm were satisfactory”; and the professional surveyor naturally shares the same conviction. It may be doubted, however, whether this favourable view is consistent with actual facts. The value of Mr. Fane's judgment on such matters may be gathered from the admiration and approval which he bestows on the Criterion and Opéra Comique theatres as models of perfection—the former of which is, in point of fact, simply an underground cellar into which the

audience has to descend in going in, and from which it has to ascend steep stairs in coming out; while the latter is approached from the Strand through a subterranean tunnel into which a visitor has to dive on entering, and from which he has to climb into the body of the house. The Lord Chamberlain's Inspector holds that the Criterion is not built on a dangerous principle, and that it is one of the best theatres in London in regard to safety and ventilation; and also that the Opéra Comique is the "most fortunately placed theatre in London," in consequence apparently of possessing the great advantages we have just described. In the latter case, he says, "the audience are perfectly safe; they might be drowned, but they certainly could not be burned." This may be consoling to some persons; but there are others who may remember that, apart from the risk of being drowned or burnt, the audience in a theatre has a chance of being crushed to death in passages overcrowded by a panic-stricken throng, and that it is therefore desirable that the egress, although it cannot in all cases be perfectly level, should be an easy descent, instead of a troublesome movement up and down. Mr. Fane also calculates that, on an average, most of the London theatres can be cleared in five or six, or, at the most, seven minutes, and says that he has himself seen one cleared in two minutes. All this of course may be true, though, from our own observation, we should doubt whether, whatever may be the possibilities of the matter, audiences do, as a matter of fact, get out so quickly; indeed it is known that many people think it prudent to leave before the curtain falls. However that may be, the question is not whether the means of egress are sufficient for a quiet, orderly, and comparatively leisurely crowd, but whether they will allow elbow-room to a crowd in a state of wild panic. The witness himself acknowledged that there was not so much danger from fire as from panic, and that the great thing in such a case was to get the people out of the house as quickly as possible; and he added that he would rather trust to the width of the doors and passages than to any other contrivance, and that if theatres were going to be rebuilt, he would recommend that there should be wider doors and passages. This is of course an admission that the doors and passages of certain theatres are not at present sufficiently wide for safety in a panic; yet Mr. Fane would allow them to remain as they are, to the danger of the public. "The Lord Chamberlain," he said, "had not felt it his duty to interfere, seeing that the theatres were safe under ordinary circumstances, and seeing also that he could not give any effect to an order except by refusing the licence." The answer to this is that, though no doubt the theatres are in an ordinary way safe enough, there is always a possibility of a fire, or, at any rate, of a panic; and that it is necessary to provide for the safety of an audience not only "under ordinary circumstances," when people are cool and collected, and able to take care of themselves, but, above all, under extraordinary circumstances, such as a fire or panic. Nothing can be more absurd and futile than to make arrangements of this kind on the assumption that everything is invariably to go on in an ordinary way, and to neglect making any preparation for emergencies which, though they may not be frequent, may happen at any time. The strength of a chain is the strength of its weakest link; and it cannot be said that adequate protection is given to the public by a system which trusts to an audience always marching out of a theatre like a regiment on parade, and makes no provision for a tumultuous rush of panic-stricken people.

Mr. Fane having thus admitted that some of the theatres are at the present moment in a dangerous condition, the question arises why the Lord Chamberlain's authority is not exerted in order to compel the defaulting managers to make adequate arrangements for public safety. His explanation of the paralysis of the department in this respect is that, "if the measures taken by a manager were not satisfactory, the Lord Chamberlain has no power to enforce the requirements which he deems necessary, except by taking the extreme step of refusing the licence, and in no instance has that been done." Any one, however, who turns to the Act of Victoria 6 & 7, will see that the Lord Chamberlain is fully authorized either to refuse or to suspend a licence for such time as he may fix, and also to inflict penalties as a punishment for a breach of any of the regulations which he has laid down. And why is this not done? If a manager is wilfully imperilling the lives of theatre-goers, why should the Lord Chamberlain hesitate to execute the law which it is his business to carry out, and which is expressly intended as a means of securing public safety, and to treat the security? On this point we have also the evidence of the Lord Chamberlain himself, who tells us that "his powers are practically limited to the renewal or refusal of licences at Michaelmas, but occasionally he made suggestions to the managers of theatres with a view of securing the protection of those establishments from fire"; but, if the managers refuse to do what he wants, he has no means of dealing with them except by putting the law in force, which he shrinks from doing. This of course shows that he has never taken the trouble to read the Act which he is appointed to enforce; and further his own experience contradicts his opinions. Once, it seems, he had actually the courage to give notice to the managers of the Vaudeville—one of the most ill-constructed and dangerous houses in London—that, if they continued the practice of blocking up the gangways with chairs, they must not expect the renewal of their licence, and this had "the desired effect," though previously his remonstrances had been treated

with the utmost contempt. He also admits that "the condition of some of the smaller theatres is so unsatisfactory that the consequences of a panic, which at any time might occur, would be fearful." This is notorious, and yet the Lord Chamberlain is content to allow the public to be constantly exposed, to his own knowledge, to this dreadful fate, rather than resort to the "extreme act of refusing a licence." The effect of his intimation in the Vaudeville case should have shown him that even a threat of cancelling a licence has sometimes a wholesome effect; and there can be no doubt that, if this were done more resolutely and systematically, a great deal might be accomplished for the safety of the public. Considering the fearful consequences of a fire or panic, it is ridiculous to pretend that the withdrawal from a contumacious manager of a licence, the privileges of which he abuses, is too heavy a punishment. In any case, it is the only way of bringing him to his senses. The Lord Chamberlain also remarked that, as long as the tipping to servants of the theatres went on, he despaired of being able to enforce the regulations as to the comfort of audiences effectually. It is notorious that, in regard to all the points enumerated in the Lord Chamberlain's memorandum, quoted above, the managers are now allowed to do very much as they like; and that "the comfort, order, and decency," and also "the perfect system of lighting, ventilation, and security from fire and easy egress in the case of a panic," are, except in the way of mere verbal advice, entirely neglected. The atmosphere in most theatres is as poisonous as the refreshments; and nothing can be more indecorous than the close personal contact which is forced upon men and women by the narrowness of the stall passages. As for the sort of people who are usually employed in "the front of the house," and whose chief business seems to be to levy black mail, and to insult visitors who will not submit to their impudent extortions, they are a disgrace to the theatres where they are allowed. But this would soon be set to rights if the proper pressure were applied to managers.

It is not surprising to hear the Lord Chamberlain, under such circumstances, suggesting that his office ought to be relieved of a responsibility for which it is so obviously incompetent. In regard to the dramatic censorship the work is done, on the whole, judiciously and efficiently; but the inspection of theatres is clearly of the most cursory and superficial kind, and little better than a farce. It is said that in the case of new theatres "particular attention is paid to the means of egress and precautions against fire"; but new theatres are rarely built, and the peril to which the public is exposed is the toleration of existing buildings which do not comply with the well-understood and indispensable conditions of safety. It is easy to understand that it may be inconvenient and expensive for the owners of these houses to put them in a proper state with adequate accommodation inside and adequate means of egress. Any one who considers the matter at all must see that a theatre, from its peculiar construction and the uses to which it is put, requires to be very closely looked after; for though it is true that the actual burning of theatres is usually attended with comparatively little loss of life, there is a constant danger of sudden panic, of which, when it occurs, the effects are often, as in Brooklyn, of the most appalling character. The verdict of the jury on that terrible catastrophe was that the theatre was constructed in a substantial and satisfactory manner, and that the destruction of life was due to the inexcusable neglect of the management; there being no responsible head of the servants of the theatre or discipline among them; the appliances for the extinguishment of fire upon the stage or in the flies being wholly inadequate; the fire-hose not being kept in its place and use; and there being a culpable neglect in one of the exits from the theatre being so effectually closed as to resist the efforts of several persons who attempted to force it. Now there can be little doubt that in some of the London theatres many of these conditions exist, and might at any moment produce a terrible calamity. The Brooklyn jury, among other suggestions, recommended two things which are much wanting also over here—a strong brick wall extending from cellar to roof, and dividing the stage from the auditorium; and the employment of a special staff in theatres whose sole duty should be to attend to the hydrants and other precautions against fire whenever there was an audience in the house. There can be no doubt that what is most urgently required in our own theatres is a body of regular firemen, with adequate experience and under proper command, whose presence would give confidence to an audience, as would also the knowledge that the hydrants were being attended to by competent hands, and that a strong wall divided the stage from the rest of the house. As we have said, we must postpone detailed criticism till the complete evidence has been produced; but there can be little doubt that a strong case will be found to have been made out, not only for relieving the Lord Chamberlain of the duty which that functionary and his predecessors have so long neglected of protecting the public from the special dangers of theatres, but also for establishing a general system of inspection and regulation in regard to all classes of large public buildings.

PICTURE EXHIBITIONS.

ANY one who wanted to make an easy answer to the accusation of want of artistic taste frequently brought against English people might point to the number of picture-galleries now open in London. To this it might be replied that quality is of more importance than quantity, and no doubt the frequency with which

certain exhibitions are opened has in some respects an evil influence. It would be easy to name artists who are led by this, among other causes, to sacrifice care to rapidity of production, and who, having found that a peculiar mannerism is a safe attraction to a certain number of people, rely contentedly upon this, without making any experiment after further progress in their art. And an evil result of this is that, as in other arts, whenever such a mannerism has been proved successful, a number of imitators will spring up, some of whom might have done good original work if they had not yielded to the imitative tendency. Several instances of this might be pointed out in the present exhibition of the Society of Painters in Water Colours, and perhaps the most glaring among them is Mrs. Allingham's "Old Men's Gardens, Chelsea Hospital" (139), which is a very evident and equally unsuccessful attempt at reproducing the effect of the late Mr. Walker's "Harbour of Refuge." Something of that painter's trick of colour, exaggerated however to a disagreeable extent, has been caught; but of the imagination and feeling which gave charm to his work there is nothing. One turns with pleasure from this to "The Plough" (82), by Mr. Arthur Hopkins, which may be said to be in the school of Mr. Walker, without being a servile imitation. The general effect of landscape is very like that of an oil-picture of Mr. Walker's which treated the same subject; but one sees true feeling in the work, and there are both force and originality in the bringing out of the different characteristics of the horses, one of which is doing honest hard work, while the other takes advantage of this to indulge his laziness. The figure of the man in the foreground is less successful; and another picture by Mr. Hopkins, "The Genius of the Village" (57), is spoilt by too close imitation of Mr. Walker's peculiar scheme of colour. As a contrast to the dangers of imitation, we may point to "O'Hara's Tower Height, Gibraltar" (66), by Mr. Sam. T. G. Evans, which, with three other works (149, 159, 174), by the same artist, may claim originality for their complete falseness in colour, drawing, and composition. Originality of the wrong kind is found also, though in a far less degree, in the "Water Babies" (71), of Mr. Albert Goodwin, where truth of colour has been altogether sacrificed to a desire for a fantastic effect. Another picture by the same artist, "Herring in the Bay" (62), a by no means unsuccessful attempt at one of the difficult effects of light on the sea in which Mr. Brett excels, is, we think, the best of Mr. Goodwin's present contributions, though it is run hard by the "Arabian Night" (80), which is a very delicate rendering of a peculiar effect. That clever and prolific artist Mr. J. D. Watson sends only four contributions, of which the best, to our thinking, is "A River-side Pastoral" (140), in which there is a fine effect of light and shade, while the texture of the rocks and moss in the foreground is admirably true. Next to this hangs "Sirocco Day, Venice" (141), which is in some ways the most satisfactory of Miss Clara Montalba's customary representations of Venetian scenes, many of which suffer much from the great want of transparency in the water. Mr. Goodall in his "Venice" (145) has caught a warmer glow than is found in Miss Montalba's paintings, but his work is wanting in breadth and gradation. Mr. Naftel, who has too great a tendency to what may be called elaborate frippery of execution, is at his best in the present exhibition in "Cookham Church" (37), which is an extremely pretty and delicate, if somewhat tricky, piece of work, needlessly injured by the introduction of a red piece of drapery in the punt lying against the shore, which is out of keeping with the general tone. Mr. H. Moore, in "The First Snow of Autumn on the Sea Fell Range" (15), has struck out a new line in which he has not as yet been particularly successful. The best of his contributions seems to us to be "A Grey Day, Yarmouth Jetty" (94), which is very careful and artistic, and in which the movement of the sea is particularly good. Messrs. Fripp, S. P. Jackson, David Cox, junior, and Frederick Tayler send works which are in the several artists' well-known manners and sustain their reputations. Mr. R. W. Macbeth has made a distinct success with his "Ghost Story" (219), which is very humorous without exaggeration; Mr. Arthur H. Marsh, in "Driftwood" (198), has caught something of the feeling and power of M. Israels, and Mr. Branwhite may set against the atrocious colour of his "Old Lime Kiln" (177) the daring and clever treatment of "Winter Twilight—a Black Frost" (63), where the contrast between the cold foreground of ice and the warmth of light at the back is as striking as the painting of the ice is true. Mr. Alma Tadema's "Interesting Scroll" (218) is not a very interesting picture. The subject is dull, the tone unpleasantly cold, and for once the artist seems to fall below his usual level in his unequalled rendering of marble; but this defect seems partly due to the roughness of the paper employed. Mr. F. Powell's sea studies will be seen with interest, as will a spirited specimen (8) of Sir John Gilbert's still better-known martial effects. From Mr. J. W. North comes only one work, "Roses, Asphodel, and Cypress—Algeria" (67), which contains some exquisitely delicate painting in the foreground, and has throughout an unusually fine tone, but is marred by a curious want of proportion between the foreground and distance. Mr. Birket Foster's "Capture of a 32-Pounder" (32) is marvellously hard, and the heap of shot on the left looks in its fruity texture as if intended to represent grape-shot in a literal sense. Mr. H. P. Riviere's "Dying Brigand" (187) is an admirable, though unconscious, stroke of satire at the melodrama of a past age.

At the Exhibition of the Institute of Painters in Water Colours we find, taking the pictures in numerical order, two specimens (3, 19) of Mr. Aumonier's clever work, of which the second is the better, and is to be blamed only for the whiteness of the water,

which is inconsistent with that of the sky. Mr. Lucas's "Last Purchase" (24) is a clever caricature of an amateur looking at a new picture. Mr. Wimperis contributes three bright and pleasant bits of landscape (34, 57, 65), and the work of Mr. Walter May, who is represented by nine contributions, is remarkable for its care and skill. Two productions of great cleverness, Mr. Green's "Here They Come!" (38) and Miss Gow's "Box at the Pantomime" (84), seem less pictures, properly so called, than elaborated versions of illustrations for weekly papers—a fault which Mr. W. Simpson has artistically avoided in his sketches of "Dr. Schliemann's Excavations at Mycenæ" (91), and "The Morning after the Carnival" (110). Mr. L. Haghe's "Summit of Grand Son" (95) is a very curious production. It seems to represent a strange freak on the part of a Scotch laird. A party of men, some clothed in serge or cloth cowls, some in waterproofs, are scaling a hill; one is being dragged up much against his will and much to the delight of a comrade who jeers at him; a party of plaided gillies keeps careful watch meanwhile over a basket of provisions. Examination of the catalogue shows that the picture represents the monks of the Grande Chartreuse making a pilgrimage to the highest peak near the monastery. Mr. Brouley's "Nearest Way to Church" (103) has intentional and real humour of a light kind as well as some very skillful painting. Mr. Syer has a clever and pretty sketch (119), and Mr. Linton sends "Ave Maria" (149), in which the drawing and expression are excellent, while the colour is very unhappy. Mr. Hugh Carter's work seems to show that the painter is, as it were, trying to find a style; and Mr. Charles Cattermole's productions in the school of Sir John Gilbert are spirited and lively. Of two animal studies, by Mr. J. Wolf (69, 227), the second is the better; the first is too like a study taken from a naturalist's window of stuffed fish and birds. Mr. E. J. Gregory, a young painter of great promise, has, we think, made a mistake in seeking inspiration, as from his "Tween Acts" (230) he seems to have done, in the eccentric studies of M. Degaz. He might well leave the elaboration of the figures of clumsily made and uninteresting ballet-girls to the French painter who chooses to divide his time between such studies and those of equally ugly and dull washerwomen.

Foreign art is well represented at the French Gallery in Pall Mall, and at that of MM. Goupil in Bedford Street. The former exhibition is almost above the high level we are accustomed to, containing as it does many interesting examples of such work as that of MM. Jules Breton, Israels, Diaz, Daubigny, Vibert, Bouguereau, Laupheimer, and others. In the French Gallery a small specimen of Señor Domingo's work may be compared with interest with M. Meissonier's "Sous le Balcon." While the Spanish painter holds his own in expression of character and detail, he has not yet found the secret of the bold relief and truth which M. Meissonier gives to his solitary figure. Several unfinished specimens of Señor Fortuny's work, the most important of which is exhibited at MM. Goupil's gallery, serve to show the immense superiority of the master's work to that of the brilliant but shallow school which followed him.

RACING AT NEWMARKET AND EPSOM.

OF far greater importance than any sport that took place at Newmarket last week was the anxiously expected meeting of the Jockey Club, at which it was understood that the fate of foreign-bred horses would be decided. At the last moment, however, so strong an appeal was made to Lord Eglon in favour of delay that he consented to postpone his resolutions till the Houghton week. Thus French horses will at any rate have another season on the English turf, and English sportsmen will have ample opportunity for considering whether their presence on our racetracks or their absence from them is likely to be the greater calamity. Many things may happen during the present season. Perhaps Chamant may win the Two Thousand, or the Derby, or both; and then owners who cannot breed horses equally good will clamour once more for the removal of these dangerous and objectionable rivals. Perhaps Chamant may be beaten, and the French horses generally may have a bad season; and in that case we may entertain more lenient feelings towards those enterprising sportsmen across the Channel who subscribe no inconsiderable proportion of the stakes which our horses pick up. We fear very much that pecuniary considerations are at the bottom of all the disturbance, and that such considerations will carry the day. If, then, the second Gladiateur makes his appearance this year, it is only too likely that a spoke will be put in the wheel of any aspiring successor to his honours. After what took place at their meeting in the Oraven week, we can hardly expect any course of action from the Jockey Club save such as is dictated by the whim or the passion of the moment.

When it was announced that a member of the Club intended to move that the minimum weight in handicaps should be reduced from 5 st. 7 lbs. to 4 st. 7 lbs., almost every one thought that a joke was meant. It was doubted whether a seconder would be found to support so extravagant a proposition; but, however that might be, it was taken for granted that the resolution would not be seriously pressed. Great was the astonishment and dismay which fell on all who have any lingering regard for a time-honoured national sport when the news came that the revival of one of its worst abuses had been not only proposed and

seconded, but carried by a majority of one in a meeting of twenty-one members. It is not the custom to furnish any report of the debates of the Turf Parliament, and therefore we are left to guess the arguments that satisfied the judgment of eleven members of the Jockey Club. We have heard that it was seriously urged that, inasmuch as hardly any 5 st. 7 lbs. boys are able to ride, they ought to be taken in hand at a still lighter weight, and at a still more infantile age. By beginning their public career at 4 st. 7 lbs., their education would be so far advanced by the time they scaled 5 st. 7 lbs. that they would be able to do something more than they do at present—hang on to their horses' necks without the power to guide them, leaving the issue of the race dependent on their horses' inclinations and abilities instead of their own. In fact, the remedy for one abuse was, it seems, to be found in the creation of a greater one. The really good riders would be still more completely precluded than they are now from taking their proper place in handicap races; for if 4 st. 7 lbs. were the lowest weight, the highest weight accepting would rarely exceed 7 st. 7 lbs. or 7 st. 10 lbs., and the ablest horsemen of the day would then have to stand down and look on while the little candidates for honours in the new school of riding were going through their interesting and artistic performances. But the question, after all, is one which affects racehorses even more than jockeys. A feather weight of 4 st. 7 lbs. presupposes the existence of a horse more than 4 st. below Derby form, and the legalization of such a weight shows that our Turf legislators not only consider it advisable that such worthless specimens of the thoroughbred should be kept in training, but are actually willing to offer inducements for the express purpose of protracting their racing careers. Many of the best sportsmen of the day have long been of opinion that an alteration of the law in a directly opposite direction was urgently needed, and that 6 st. should be the minimum weight in handicaps. They have not been able hitherto to gain over the majority of the Jockey Club to their views; but, on the other hand, there has been no whisper till the present year of any such attempt at a retrograde policy as that which was unfortunately crowned with success last week. As the law now stands, we are threatened with a revival of the worst abuses of the worst days of racing—baby jockeys, unable to control their horses, throwing the field into confusion, and frustrating the efforts of the starter, and horses of the lowest order of merit, or rather of no value at all, except for purposes of gambling.

All that can be done now is to try to get this miserable law repealed as soon as possible. We are glad to observe that directly the division had been taken notice was given by Lord Hardwicke and Sir J. Astley of their intention to move at the earliest opportunity for the restoration of the rule which Mr. Alexander and Colonel Forester had succeeded in altering. And we can hardly doubt that a really representative meeting of the Jockey Club will find little difficulty in reversing the work so hastily accomplished in the Craven week. The Jockey Club is a mixed body, and the foolishness and obstinacy which are amply represented among its members may snatch an occasional triumph; but there are better influences in the supreme council of the Turf which, we may venture to hope, will ultimately gain the mastery. The new Rules of Racing bear testimony, on the whole, to a sincere desire on the part of its framers to uphold and extend the influence and authority of the Club as the legitimate guardian of the honour and integrity of the Turf; and we cannot believe that there is a deliberate design to undo the good work which has been seriously undertaken, and has advanced some considerable way toward completion. When the two Stewards of the Jockey Club invite their colleagues to reconsider their late unfortunate decision, it may be hoped that members like the Duke of Richmond, Lord Granville, and Lord Hartington will be induced to attend, and use their influence to secure the restoration of the repealed rule. Should the curious addition to racing law for which we are indebted to the nine members of the Club who followed the leadership of Mr. Alexander and Colonel Forester, be formally ratified, it would indeed be high time for the Legislature to intervene. Some years ago, when Parliamentary interference in racing matters was threatened, the late Lord Derby gave his personal pledge that the Jockey Club would undertake all necessary reforms. We cannot say that reform has advanced with very rapid strides since the date of that promise; but at any rate the trust placed in the Jockey Club has not hitherto been betrayed. Such an insult to public opinion, however, such a defiance to all those who have striven to improve the character of racing, as was perpetrated last week must necessarily cause the withdrawal of all confidence in the judgment of the Jockey Club, unless speedy reparation be made. We should like, for our own part, to see the Turf Parliament continue to administer its own affairs; for indications are not wanting that, if the Legislature is driven to interfere with the management of horseracing, it will not deal with the subject in a very tender spirit.

A very brief notice will suffice of the Craven Meeting sport, which, though fairly well sustained from first to last, presented few features of importance. Ominous rumours were current to the disadvantage of three of the leading performers of 1876—Chamant, Lady Golightly, and Plunger—but the admirers of the two first-named had an opportunity of seeing their favourites, who were brought out during the week, though only to walk over for their engagements. Report had it that Chamant was beaten in a trial by his stable companion Verneuil; yet that might be, and still Chamant might be entitled to the continued support of his friends for

his great three-year-old engagements, for Verneuil was a very good-looking horse last year, and promised to grow into a very good one. For the hostility to Plunger there may be some reason, as it appears that he has been sold, and some suspicion usually attaches to horses sold on the eve of important engagements, though we must admit that occasionally the buyers know as much as the sellers. But it must be mentioned that Plunger declined an engagement of some value last week which on public form was at his mercy; and this circumstance was unfavourably noticed. Disagreeable reports were circulated as to Lady Golightly having manifested symptoms of roaring; and altogether the favourites for the Two Thousand and Derby had a bad time, though Chamant speedily recovered from the opposition directed against him. The Biennial, which has on more than one occasion proved a veritable Two Thousand trial, brought out a field of twelve runners, but the race was almost universally looked on as a match between Warren Hastings and Silvio. Neither of this pair, however, nor Cherron, who alone of the remainder was judged capable of effecting a surprise, finished in the first three, and the race fell to an unnoticed outsider, Grey Friar, who for more than half the distance appeared to be tailed off. A terrible east wind blew during the race, and both Silvio and Warren Hastings seemed to curl up under its influence. Still such an excuse for their defeat can hardly be admissible, and it will probably be safer to discard the Biennial field altogether, as little likely to furnish a formidable candidate for Two Thousand or Derby honours. Another three-year-old winner, as unlooked for almost as Grey Friar, was Hidalgo, a fine-looking son of Pero Gomez, who won the Sale Stakes in a canter, in the absence of Plunger, and two hours afterwards carried off the Newmarket Handicap over the severe last mile and a half of the Beacon course. This last performance was by no means to be despised; for Hidalgo is a horse who, we should fancy, waits holding together, and his gameness had more to do with his victory than his small jockey's riding. On the third day of the meeting Skylark successfully compassed the two miles from the Ditch in on two occasions, beating Coltness in his first and Twine the Plaiden in his second essay. Lord Falmouth's horse has evidently wintered well, and will be of great service to his owner as a schoolmaster to his three-year-olds. If we add that on this particular day P. Archer rode six winning races; that Mr. Sanford, the American sportsman who had such singular ill fortune last year, was successful on two occasions, one of his winners, Brown Prince, being a very promising three-year-old, engaged in the Derby; that Ecossais and Farnese showed, despite their un-soundness, that their fine turn of speed could yet avail to bring them to the front, and that the Newmarket International Handicap hardly promises to fulfil the expectations of its founders, we shall have said as much of the events of the Craven Meeting as is necessary.

There is little better racing during the season than that which is witnessed at Epsom in the April meeting, and the City and Suburban Handicap in particular steadily upholds its popularity as the Cambridgeshire of the spring. A brilliant field of twenty-eight came to the post last Tuesday for this interesting event, and the result confirmed public anticipations to the letter, the first three favourites occupying corresponding positions at the end of the race. The three-year-olds were powerfully represented by Touchet, who was tried up to Derby form early in the year, but who failed in the Lincoln Handicap, the first great certainty of the season, as was generally supposed; and Rosbach, Warrior, the Voltella colt, and Warren Hastings had also pretensions to something more than handicap form, though the inglorious exhibition of the latter in the Craven week had of course diminished his prospects for his Epsom engagement. St. Leger, Tassel, Newport, John Day, Hesper, and Julius Cæsar were among the four-year-olds, and Chaplet, The Snail, The Ghost, and Balbriggan represented the older horses. Altogether it was a field of winners; for hardly one of the horses we have mentioned has failed to distinguish himself; and had Bruce stood his preparation and come to the post fit and well, it would have been difficult to collect together at so early a period of the season a company of superior quality. Where so many were good, either very superior merit, or very high trials, or a great advantage in the weights, were indispensable conditions for favouritism; and there was much wavering and uncertainty before a definite selection could be made on which implicit trust might be placed. On their merits, or at the weights, more than half the field were worth backing; and, as a matter of fact, more than half were backed. Touchet, despite his defeat at Lincoln, again carried the confidence of his friends; the high respect due to Chaplet on account of her public performances was increased by the news of a most favourable trial; Balbriggan, a five-year-old, with 6 st. 7 lbs., was backed as old horses thrown in to handicaps invariably are backed, and often to good purpose, like Sutton for the Cambridgeshire; and Julius Cæsar, unlucky horse as he might be esteemed in so often just missing the prize of victory, could not possibly be passed over by those who remembered that he secured a place in all the classic races of 1876—in the Two Thousand, the Derby, the Prince of Wales's Stakes at Ascot, and the St. Leger. It was no harsh treatment to allot 7 st. 9 lbs. to a four-year-old who had always been thereabouts, if not actually there, during his three-year-old career, and when opposed to the best horses of his own age, and who had stretched the neck of the flying Petrarch over the Rowley mile. And the result showed that Julius Cæsar was well able to meet a highly-tried three-year-old like Touchet at a difference of 24 lbs., as well as to beat all purely handicap form with-

out difficulty. The race, in fact, was at his mercy at any moment when his jockey chose to let him go; but, after pulling him back from the front at an early part of the race, Archer made no attempt to resume the lead till reaching the commencement of the enclosure. There he gave him his head, and the son of St. Albans, having the foot of his opponents, of whom the stable companions Touchet and Snail were the most formidable, raced away and won in a canter by six lengths. Touchet and The Snail might have secured second and third places, but the latter being eased at the last, Balbriggan ran into a position, while Hesper, John Day, and The Ghost were the nearest followers of the four leading horses. No victory could have been more easily obtained, and it was well received, the performances of Julius Caesar having been consistent. The horse may probably have not the best of tempers, but there was nothing to try it last Tuesday. He had only to gallop and was never called on to make a struggle. With Julius Caesar out of the way, Lord Roschery could have won either with Touchet or The Snail, and evidently no mistake had been made about the former's trial, though the forward position of his ancient stable companion, who was supposed to have lost the turn of speed so necessary in the City and Suburban, excited some surprise. But, if Touchet were a Derby horse, he ought to have got much nearer, at the weights, to Julius Caesar, who, whatever his merits, has no claim to rank with the best of his year.

REVIEWS.

THE CORRESPONDENCE OF BALZAC.

THE handsome library edition of Balzac's works which it has taken many years to bring out has at last been completed, and has been supplemented by a final volume containing Balzac's correspondence. But, as the library edition has the demerit of being large and heavy, the correspondence has been published separately in two volumes of a more convenient size, and may be bought and studied apart from the works. Balzac held so high a place in French literature that it is natural to wish to know something of his life, and to understand what kind of man he was in his immediate personal relations with his friends and his family. Much that illustrates his character, his circumstances, and his habits is to be gleaned from his correspondence. But a correspondence without a biographical accompaniment is apt to be bewildering. The reader cannot gather from the mere date at the top of a letter what was happening to the writer when he wrote, and Balzac was a man the thread of whose life was indicated by his letters in an unusually slight degree. The letters, as we peruse these volumes, seem floating in the air with nothing to connect them. And not only have the editors of the correspondence not attempted to give anything like the connecting story of his life, but no life of Balzac exists anywhere. Books have been written about Balzac, but they are for the most part poor pieces of bookmaking. Verdet, who was his publisher for a few years, has written a mournful mass of grandiloquence about the troubles he had to encounter at the hands of Balzac, who seems to have pushed to a fatal extreme the right which an author has to borrow of his publisher. Lamartine, who might have been supposed capable of something better, wrote a memoir or study of Balzac which consists of some feeble reminiscences of meetings with Balzac in society, extracts from the previously published letters of Balzac to his sister, and a long analysis of *Eugenie Grandet*. M. Cozzan published two books about Balzac—one called *Balzac chez lui* and the other *Balzac en pantalons*—which are supposed to describe the novelist in the intimacy of private life, but which are mere collections of the silliest and most vapid gossip. Balzac also was in the habit of carrying a grand cane with a handle studded with precious stones, and in a fanciful connexion with this cane Mme. Emile de Girardin wrote a story of dull impropriety called *La canne de M. de Balzac*. Finally, a M. Baschet, a Belgian, wrote a Memoir of Balzac which is, if possible, more empty than the French accounts of him. The searcher for a life of Balzac is like a traveller who is forced to pass from one piece of shifting mud to another. It may, however, be said in justice to all these biographers, that there never perhaps was a man of eminence of whose life there was so little distinct and interesting to record. The most sensible—perhaps, the only sensible—passage in M. Cozzan's two works is that in which he confesses that, with the most burning desire to say something about Balzac, he finds he has nothing to say. The correspondence now published has at least the merit that it allows us to see Balzac as he was, so far as any letter-writer really reveals himself to his correspondents. If a few connecting links are supplied, it is possible to piece together from these letters something like the story of his life. To do this adequately would require a considerable space; but a short sketch may convey some notion of what Balzac was, with his greatness and his littleness, his many faults and his few, but sterling, virtues.

Balzac was born at Tours in 1799 on the 21st of May, which, being the feast of St. Honorius, suggested Honoré as his Christian name. His father, an advocate, had recently married, at the age of fifty, a young lady the daughter of one of his colleagues;

but as he had not contemplated marriage, he had invested most of his money in a tontine, and he spent his married life chiefly in endeavours to live as long as possible, with the dazzling hope of a fortune always before him if he could but manage to survive his associates. So successful were his efforts that he lived to be eighty-three, and did not die until 1829, when Balzac was thirty. His wife possessed some fortune, but it was lost through bad investments, so that Balzac, although brought up in comfort, had nothing to inherit. He passed through school and college without distinction; but his sister Laura, two years his junior, who was his intimate friend through life, records his passionate fondness for reading every kind of literature except school lessons, and his early aptitude for inventing plots and scenes. After his time at college was over, his father had an excellent opportunity of establishing him with a notary, but Balzac boldly declared that he would be nothing except a writer. The family discussion consequent on this announcement was ended by his being permitted to live alone in an attic with just enough money allowed him to support life, in order that he might have a practical experience of the miseries which unknown authors undergo. The first letters in the collection now published are dated from this attic, and describe the ferocious energy with which he devoured books and tried to write them. The pecuniary struggles which he had to undergo are also depicted, as well as the strange whims by which their burden was augmented. He had to live on five pounds a month and to sit without a fire; but he took into his head to hire a man servant, to buy a piano, and to plan a hydraulic apparatus for the incommensurate purpose of making his cellar. From this state of penury and aspiration he was relieved by permission to return to his father's house; and in order to secure an independent income, he began to sell himself to the very small booksellers who would purchase tales hastily written by an unknown author. A friend who wished to give him an opening in another direction furnished him with funds, which he employed in commencing a reprint of French classical authors in single volumes at low prices. But he knew nothing of the book trade, and the money furnished him was soon gone. More money was found to give him a fresh start, and he set up first as a printer and then as a typesetter, but was quickly brought to the verge of bankruptcy, from which he was only saved by an advance from his mother of 2,000*l*. This was the beginning of those famous debts which form the constant theme of his correspondence in after years. Gradually his stories became better known and better worth reading; but it was not until the publication of the *Peau de Chagrin* in 1831 that he had any great success. This book may be said to mark an epoch in his life; for it not only convinced competent critics that France had a new writer of great original power, but it indicated that he was already under the influence of the idea which ever afterwards possessed him, that his novels were all parts of a great whole, and that it was his mission to paint on an enormous scale the full extent of human life as it existed in France in his day. "The public," he writes to Charles de Bernard in August 1831, "will recognize, I hope, how immense and how new is the undertaking in which I may fail, but which I shall try to carry out." The notion that the *Comédie humaine* was his true subject had taken hold of him, and never afterwards quitted him.

His sister, while he was still living in his attic, had married M. Surville, an engineer, but she remained his closest and most intimate friend. His letters to her are uniformly written in a vein of frank and confiding affection. With his mother his relations were less happy, for, as he expresses it, she was one of those women who put thorns among the roses of life; and, after his father's death, she was mainly dependent on an annuity which Balzac engaged to pay her, but for the instalments of which she was often obliged to wait, receiving instead a statement of the enormous energy with which he was working and of his present condition of utter impecuniosity. These financial statements form a wearisome part of his correspondence. He had a love of calculation, and he was delighted with the task of making imaginary balance-sheets based on the profits he was sure to make. He worked desperately hard, and wrote many of his best works in the years which immediately followed the publication of the *Peau de Chagrin*. *Eugenie Grandet*, the *Médecin de Campagne*, and *Père Goriot* all belong to this period, and he had generally two or three tales in hand at once. It may be assumed that the strain thus put on his energies was greater than he would have had to endure if he had written his tales successively. But, in order to raise money, he was perpetually dealing with new publishers, and his conception of a publisher was always that of a person who would lend him money on the strength of something he was going to write. Quarrels with publishers occupy almost as large a part of his letters as statements of his actual and possible finances; and quarrels with publishers, though matters of the greatest importance to authors, are not amusing for outsiders to read of. He was by this time a lion in Paris society; but of Paris and of society, of what was going on in France, of literature or politics, or of the thoughts and deeds of other people, Balzac never wrote. He was entirely taken up with his own troubles and his own writings; and he had in his troubles the consolation, which to an author is perhaps the greatest possible, of an undaunted belief in his genius and in the merits of his writing. It seemed scarcely credible to him that any human being should be able to write such books as he wrote, and every new novel he wrote was destined to surpass all that had gone before. Perhaps the tale which is generally considered his masterpiece, *Eugenie Grandet*, is that of which he speaks least. But he tells one correspondent that the *Médecin*

* Correspondance de H. de Balzac, 1819-1850. Paris: Lévy. 1877.

de Campagne is meant to attain the simple grandeur of the Gospel, to surpass the *Picar of Wakefield*, and to show in action the *Imitatio Christi*: and another that *Louis Lambert*, which was a sort of poetical autobiography, was a pendant to *Phuel* and *Manfred*. His isolation, however, and his absorption in his own affairs saved him from everything like jealousy or depreciation of his contemporaries. There was an utter absence of ill-nature in Balzac, and an utter absence of literary meanness. To pour out his heart to his friends, to get into debt, to gratify his whims, to work all night with the fatal aid of black coffee, and to follow with affectionate admiration the workings of his own mind, amply sufficed to fill up his life, and provide him with the strange sort of happy misery in which he found his supreme delight.

In 1835 begin his letters to the Countess Rzewuska, whom he had met and loved in 1833. The earlier letters to her were lost in a fire, and, when the correspondence now published begins, she was married, and was the Countess Hanska. Her husband died about the end of 1842, and, after a long probation, and the conquest of many obstacles and some natural apprehensions, she rewarded the fidelity of her adorer, and became Balzac's wife in 1850, shortly before his death. The letters to this lady fill a large space in the volumes now published, and form the most interesting part of their contents. Balzac wrote his very best to the woman he loved; told her everything he planned, suffered, and thought; gave her a record of his life and feelings, and never wearied in expressing the devout worship with which he regarded her. Most readers will feel that it is somewhat hard work getting through them, for there is a terrible monotony in the subjects on which Balzac writes, and letters ten or twenty pages long about a man's feelings, debts, and half-finished novels are dull reading. But at any rate they tell us all that there is to be told about Balzac. He worked enormously; and on one occasion he tells his Countess that he had then been twenty-five days without sleep. He also made much money; for in one year we find him putting down his gains at 6,000*l.*; but his debts increased the more money he made, as he was always gratifying some caprice. He was quite aware that he never showed a grain of common sense, and rather prided himself on it. In 1838, for example, he started off to Sardinia in search of the refuse of some old Roman lead mines, by which he was to make a sudden fortune. In order to carry out this brilliant scheme, he had to surmount what at first seemed an insuperable difficulty. He had to raise twenty pounds in cash for his journey money. Yet a little later on in the same year we find him buying a house at Ville d'Avray, and writing that its possession gave him a beautiful view, fresh air, of which he tells Mme. Hanska he needs an enormous quantity, freedom from the task of having to serve in the National Guard, and 1,800*l.* more debts. "Of course he is going to work as no one ever worked before, now that he has the solitude he desires. But a new position gave him new wants. His garden had the drawback of having nothing whatever in it; but it was not for a great man like Balzac to wait for trees to grow. So he informs his lady-love that everything can be got in Paris, and that he is going to buy magnolias twenty years old, limes sixteen years old, some big poplars, and vines with the grapes on ready for picking. Unfortunately his villa plunged him into expenses of a more sober and humble kind; for no sooner was it finished than it tumbled down, as the architect, who must have been a man after Balzac's own heart, had forgotten to put any foundations. While she was a married woman Mme. Hanska was too honourable and prudent to respond to his raptures, and he complains of the coldness of her letters, and even of her laughing a little at his warmth. When she was free he went to Russia to see her, and thenceforward had no reason for restraining his sentiments, or even doubting that they were returned. He had, it is true, while the existence of M. Hanska seemed to dobar him from all hopes of happiness, been sometimes tempted to think that his best mode of extricating himself from his debts was by a businesslike marriage. Thus we find him on one occasion writing to a lady correspondent that, if she could find him a lady-like, good-looking woman of thirty years of age, with twelve or sixteen thousand pounds, he would marry her, enormous as would be the sacrifice he should be making; and in another moment of depression he wrote to the same lady that he would accept a young woman of twenty-two who had the qualifications of being ambitious and witty, fit for any fortunes, whether she might be called on to preside over an embassy or keep house in a villa; and this gifted being would be received by him at the very modest figure of 8,000*l.*, or even 4,000*l.*, provided her dowry was applied exclusively to paying his debts. But after he once saw a chance of obtaining his Countess he never wavered; and if ever there was a devoted lover after the French type (he tells her he has been crying like a child while he has been calling to memory her little looks and ways), Balzac may claim to have been the man. In his wildest exaggerations he was sincere; and his truthfulness is no more to be doubted when he tells her that she is the divine guide of his life than when he informs her that the century has produced four really great men—Napoleon, Cuvier, O'Connell, and himself.

It was in 1846 that the Countess Hanska finally permitted Balzac to consider himself engaged to her. But, if he had not himself incidentally, in a letter written some time afterwards, fixed the date, it would have been difficult to have deciphered it from the correspondence. Much before that time we find him recalling to her recollection how difficult they had found it to part when they met; ten times had they walked from the sofa to the door, and ten times back from the door to the sofa, before the bitter word of farewell could be spoken. He had travelled with her on the

Rhone, and stayed with her at Naples, and he reminds her how blissfully the moments once flew on a steamer when they got up in the early dawn, and forgot the illnesses from which they were respectively suffering in the transports of sweet companionship. Nor did the fact of their engagement seem to do much towards promoting their marriage. The lady shrank from the difficulties and risks to which her marriage would expose her. She had a young daughter, and it was not until the late of this daughter was happily fixed by an early marriage that she could possibly feel herself free. Her people were in a very considerable position in Russia, and by no means approved of her making what, in a worldly point of view, was an imprudent second marriage. But the greatest of all obstacles was that of Balzac's own character and circumstances. A nervous, egotistical, overworked novelist, crippled with debts, and with no more notion of money than a baby has, may be charming as a friend or an adorer, but is rather terrifying as a husband. Balzac's health, too, was gradually breaking down under the pressure of work, anxiety, night hours, and coffee; and the lady herself became a constant sufferer, and was a victim to rheumatic gout. Balzac was in Paris during the February Revolution of 1848; and it is related that he formed part of the mob which entered the Tuileries, and was very much interested in some of the furniture he found there. But there is no reference to the Revolution in his correspondence. He always stood apart from the stream of politics and contemporary literature. It is seldom that he wanders into literary criticism; but he now and then in his letters gives vent to his hearty and fervent admiration for Scott, and he pays a willing tribute to the merits of Bayle, Charles de Bernard, and Victor Hugo. He was totally free from literary jealousy, and he did not even resent his exclusion from the Academy, acquiescing in the supposition that a man with so many debts could not properly be admitted. The concluding years of his life were principally spent at the country seat of the Countess, where he was on the pleasantest terms with her, her daughter, and her son-in-law. Numerous letters to his sister describe the fluctuations of his hopes, and his doubts whether, after all, his prolonged residence in Russia would end in his quitting the family mansion of his friends as the husband of his beloved one. At last love triumphed over everything, over the opposition of friends, the dictates of prudence, and the warnings of disease. The fatal affliction of the heart which soon carried Balzac to his grave had already declared itself, and the Countess was so completely the prey to gout that her swollen hands had become almost useless when she married. Balzac, too, found blindness creeping over him, and the married pair had scarcely reached Paris when he died, in the summer of 1850. Although their prolixity makes them wearisome, the letters which conclude these volumes are truly pathetic. Romance takes many forms, and it is not often that such real romance is offered to the public as in the story of these two old lovers, doomed by disease but supported by affection, united only to part, but beautified by the rays of genuine feeling, and convinced that even under such circumstances their marriage was the crown and the joy of existence.

CURTEIS'S RISE OF THE MACEDONIAN EMPIRE.*

MR. CURTEIS is of course not to be held responsible for the general proclamation or advertisement as to the uses of the series of which his little book forms part. The contributions of Messrs. Cox and Sankey, who present themselves in the double capacity of editors and authors, may more fairly be judged according to the standard of their prospectus, and criticized either as attempts at "a complete picture of an important period of the world's history," or as short books intended to be "specially valuable to a man who has to master a few books of Herodotus or Thucydides, Livy or Tacitus," and who wants "a short book treating his particular period in detail." The general merits of the design of this series we have more than once discussed; it is accordingly unnecessary to say more on the present occasion than that its great, though not, we think, insuperable difficulty lies, to borrow a phrase from another sort of manual, in "first catching your" epochs. Mr. Curteis is, we believe, known as an experienced and successful teacher of history; and something was therefore to be expected from him, even in this preliminary part of his task. That he has not found it an altogether easy one may be gathered from the variation in the titles by which he seeks to describe the subject of his book to his readers. In the list of "Epochs of Ancient History" prefixed to the title-page the book is announced as "The Macedonian Empire: its Rise and Culmination to the Death of Alexander the Great." On the title-page proper the superscription stands, at once more briefly and more vaguely, as "Rise of the Macedonian Empire." On the opening page of the text the title assumes the still shorter and vaguer form of "The Macedonian Empire."

Now, in whatever way we may be pleased to define an "epoch," it certainly means a time at which something stops and at which something else begins. It is not a mere section of history marked off by dates, more or less arbitrarily chosen; were it such, there would indeed be no end to Messrs. Cox and Sankey's series, and they might deal with ancient history as Juliet proposed to deal with

* *Rise of the Macedonian Empire.* By Arthur M. Curteis. (*Epochs of Ancient History Series.*) London: Longmans & Co. 1877.

the dead Romeo, and "cut it out in little" books innumerable. The something beginning in the present instance is of course the Macedonian Empire. But the Macedonian Empire as established by Philip was a wholly different thing from the Macedonian Empire as formed by the conquests of Alexander. Doubtless there is a most intimate connexion between the deeds of father and son, and an unbroken continuity in their ideas; but the operations of Philip, directly at all events, addressed themselves to a different end from that compassed by his successor; and, if ever any one man began an epoch, it was Alexander himself. Of both Philip and Alexander it may be said, as Mr. Curtius well says of the former, that they were "great beyond question, if greatness consists in having grand and definite aims, and in successfully adapting means to ends." In short, the Macedonian Empire "rose" under Philip, and not only culminated, but entirely changed its character, under his successor. It therefore seems to us that the rise of the Macedonian Empire would have furnished an appropriate and sufficiently ample theme for a single "epoch" of this series; and the Macedonian conquest of Asia for another. The former (which would have admirably suited the secondary purpose of the series) might have properly included a fuller survey of the previous history of Macedon than Mr. Curtius's limits have allowed him to give; in the latter, room might have been found for some exposition of the more immediate effects of the great conquest—which it might be very convenient for some "men" to have before them in definite shape, even though there is no great classical writer to be "mastered" in whole or in part with reference to the period in question. As it is, we fear that Mr. Curtius has attempted to put too much into his "epoch"; and to this cause we should be inclined chiefly to attribute the inequality which seems to us perceptible in his execution of his task. His special merits seem to lie in the direction of military history; and his narrative of the campaigns of Alexander accordingly strikes us as in every respect the best part of his little book. The whole of it, however, commends itself by a tone of moderation and fairness which specially becomes a work of its design and dimensions. The characters of Philip and of Alexander are sketched with candour and temperateness, though there may be some exaggeration in describing the former as not only "the boldest rider and swimmer," but as "the best educated man of the world" of his "time," as well as of his "country." The effect upon Alexander of his career could not be better summed up than in the words that he "resembled Napoleon and many another great man in the fact that extraordinary success spoiled a really great character." Mr. Curtius would, however, perhaps have done well—unless, indeed, as there is some reason to conclude, the application of historical parallels is one of the "principles" of the series—to reserve the use of this method of illustration for occasions when it could be applied with the aptness of the instance cited. The comparison of the marriage of Amyntas II. to that of Henry V. really recalls in more senses than one the famous parallel of Macedon and Monmouth; for the Lyncestæ were a native clan, not a foreign Power. To the comparison between Philip at Thebes and Peter the Great in Holland no such exception can be taken; but, with all respect for Mr. Curtius's opinions on the Eastern question, we demur to the conjectural seasoning of the following, in reference to the effects exercised by the sack of Olynthus:—

It was not so much that Philip became at once lord of an Empire reaching from the Chersonese to Thermopylæ, dominating men's imaginations as Russia dominates them now; but that it suddenly changed, as it were, the balance of men's minds (as Russia's conquest of Constantinople might change it now), blinded their eyes, disturbed their judgment, and turned even honourable politicians into timid, if not corrupt, worshippers of the rising sun.

Sufficient, we should say, for an epoch are the impulses and the *phobias* thereof. In general, while we observe in Mr. Curtius a praiseworthy absence of paradox, we cannot commend him as always eschewing commonplace. "It is," no doubt, "a phenomenon often seen in political history, that the substitution of one strong will for a hundred conflicting wills is a slow process, subject to ebb and flow, and often desperately opposed by those who have a personal interest in a time of license"; but the illustrations of the phenomenon which follow would have admitted of its being stated in fewer words. As a rule, however, Mr. Curtius is both concise and clear; and there is only one passage in his book of which it is necessary to guess the meaning:—

Nothing less than a city (such as village communities), and nothing more than a city (such as a nation), seemed to satisfy the average Greek mind.

He has one other sentence the idea of which strikes us as oddly put; but Mr. Curtius was here perhaps unconsciously seeking to vindicate the general design of his book, as to which we have already indicated our opinion. The fourth century B.C., he says,

was marked by two struggles which severally admit of comparison in any single point except in the greatness of their results and in the fact that the one was made possible by the successful result of the other—

a fact in which we fail to recognize any basis for a comparison between them, though it may prove that in one sense (though not in that corresponding to our conception of an epoch) the two struggles are parts of a single whole.

The "mission" of Macedon, afterwards revealed to Isocrates (of whose conscientiously meant but unmistakable services to the designs of Philip we observe no notice in Mr. Curtius's volume), was very darkly indeed before the eyes of her

earlier kings. Yet nothing can be more interesting than an inquiry, however summary, into the beginnings of that connexion between Macedon and Hellas which the labours of Philip were destined at last to develop into the establishment of the supremacy of the former. Mr. Curtius, while justly deeming an outline of the history of the Macedonian Kingdom essential to a sketch of the rise of the Macedonian Empire, has been obliged to compress the former within the very narrowest limits. He begins with a brief chapter on Macedonian geography, partly founded on Curtius, and passes very rapidly over the question of the precise ethnological relations between Macedonians and Greeks. We are certainly not among those who regard the question of descent as one of paramount importance in the history of any people; for a nation is often not formed as such till it has lost much, if not all, of the consciousness of its ethnological origin. When an ingenious French writer, intent upon taking a literary revenge for Sedan, casts in the teeth of the Prussians the taunt that they, the founders of German unity, are more than half of them the descendants of Slav forefathers, we think the impeachment may be disowned without any violent pang of sensitiveness. At the same time it is curious to observe how passionately even modern historians discuss the preliminary question as to the relations by descent of Macedonians and Hellenes. Ottfried Müller, for instance, filled as he was with enthusiastic admiration of the Hellenic genius, in whose capacity for self-development he recognized the source of its greatness, was eager to demonstrate the Macedonians to have been no Greeks. Niebuhr, who accepted Müller's views on this head, was similarly inclined, from his melancholy way of regarding the catastrophes of history, to see in the Macedonian victory a victory of the base over the noble, of barbarism over culture. Drumann, on the other hand, who looked upon the "centrifugal" tendencies of the Greeks with something of the sternness of Mr. Cox, and who regretted that they did not from the first adopt the drastic remedy of a strong monarchy, which Mr. Mahaffy has lately been good enough to recommend to their successors, took much comfort in the mythological indications of kinship between the Macedonians and the Hellenic family. Unfortunately, the mythology of the Macedonians as it has come down to us is not easily separable from the pedantic devices of the Alexandrine scholars; and Mr. Curtius is probably well advised in confining his references to the tradition handed down by Herodotus, which obviously had a genuinely national origin. What knowledge we possess of the early religious system of the Macedonians points upon the whole in the direction of a closer kinship than would ever have been admitted by Demosthenes; the still scantier evidence of language has the same bearing; and in political life the Macedonian kingship is essentially the kingship of the Greeks in the heroic age. Of the political institutions of the Macedonians Mr. Curtius might perhaps have found room for a brief connected notice; if we do not mistake, he on several occasions mentions the "Companions" without explicitly describing their position in the political and social system of the monarchy.

Among the Macedonian kings who preceded the father of Philip II., Mr. Curtius properly notices only those whose reigns are signalized by important stages in the historical progress of the rising kingdom. The history of Macedonia as a State may be said to begin with the foundation, under whatever circumstances it took place, of *Ægæ*, by which the Emathian plain became Macedonia. The second stage is marked by the subjection, under Amyntas I., of Pieria and Bottiaea, and by the establishment of the capital at Pella by his son, Alexander Philhellen. Thus Macedonia entered, or re-entered, into relations with the Greeks; and the invasion of Xerxes helped to extend the kingdom which was to overthrow the Empire of his descendants. The conflicts with Athens began almost as soon as Macedonia had become a maritime State, under the reign of the Greek-loving King's illegitimate successor. The policy of Perdiccas was continued by Archelaus, whose foundation of Pella marks the third and last stage in the previous history, if we may so call it, of the Macedonian kingdom, and who gave evidence so unmistakable of his desire to be reckoned a Greek and a friend of Greeks, though still only such in *partibus*.

With the death of Archelaus begins a more complicated period of Macedonian history, which is well sketched by Mr. Curtius. He shows how miserably Sparta misunderstood or ran counter to her duty as the primary power of Hellas, in co-operating with Amyntas II. in the break-up of the Olynthian synœcism. He shows how nearly the future of Greece and the future of Macedonia were alike altered by the ambition of the tyrants of Phœnix; in fact, this ambition ultimately led to a temporary Macedonian advance, which brought Macedonia and Thebes into direct conflict, and was thus the cause of the youthful Philip's removal as a hostage to the city where he was to learn the secrets of military greatness. On this part of his subject Mr. Curtius evidently dwells with special predilection; and his account of the Macedonian phalanx is remarkable for its clearness. Few tactical innovations—for the Macedonian phalanx was an improvement upon the Theban—have proved so long an endurance; for the success of Philip's application of the principle of Epaminondas "is seen in the fact that the Macedonian formation remained in vogue as the fighting system of the world, until superseded by the Roman legion"; and no event in military history is of more signal importance than that of the collision of the two systems, and the final victory of the Roman at Pydna.

Mr. Curtius's account of the long but perfectly consistent, and, to a student of ordinary intelligence, perfectly perspicuous process,

by which Philip made himself master of the destinies of Hellas; would be as interesting as his subsequent narrative of the conquests of Alexander, were it not unduly limited by the plan of his book. The author is unable to say enough of the conditions of the struggle to invest it with all the interest it possesses; and the reader who wishes to understand its different phases, more especially in the conduct of Athens, will after all have to turn to other sources in order to supplement the present narrative. Indeed, Mr. Curteis on one occasion, when speaking of the naval reform instituted by Demosthenes, remarks that its details belong to Athenian rather than to Macedonian history; but it might have easily been explained in as many lines as are devoted to writing about it. These are just the things which both teachers and learners justly expect to find in handbooks, and which a scholar like Mr. Curteis would have no difficulty in providing in a condensed form. It is, we think, of more importance that Mr. Curteis has hardly summarised with sufficient completeness the whole of the proceedings of Philip after Chæronea; it would have been well to state where he placed garrisons, and to what degree accordingly the bases of his supremacy resembled those of that held by Sparta after the Peloponnesian War.

The narrative of Alexander's campaigns is admirably adapted to its purpose, and supplies a want which has been long felt—that of a lucid but at the same time concise summary of one of the most momentous military expeditions which the world has ever known. We hope that Mr. Curteis's sketch may lead teachers of history once more to attempt a task which they are too often prone to renounce as if in despair, and to carry the studies of their pupils beyond the day of Chæronea, instead of allowing them to think, like Isocrates, that with it Greek history had come to a close. As for the great analysis of Alexander, we may well agree with Grote that its interest is not to be sought in any intention of the conqueror to be the diffuser of the civilization which he actually spread. Yet although there was here, as elsewhere, a vast discrepancy between intention and result, the enterprise of Alexander had that distinctive mark of greatness which lies in consciousness of aim. And the plan of the book before us, with which from one point of view we have been obliged to find fault, may at least excuse the revival of a very natural reflection. Had Philip lived to lead, as he hoped to have done, the Macedonian and Greek hosts into Asia, would he, like his son, have sought to convert East and West into one great monarchy, of which the members would lose their national identity by amalgamation, by transplantation, by intimate mutual intercourse—by the various means which Alexander was actually engaged in organizing when death cut short his career? Or would he have been satisfied with the establishment of a Mediterranean Empire, or, at all events, with such a share in the dominion of the East as would have been accepted by Alexander before Tyre “had he been Parmenio”? Alexander consciously aimed at the whole; and his purpose was to conquer a world. Even in his case ambition overleapt itself; nor were the East and the West made one by him; but history tells of no second instance where imagination was so nearly approached by achievement. We wish that, with the help of Thirlwall and Grote and Droysen, Mr. Curteis would convert the second part of his little book into a work of wider dimensions, yet still sufficiently concise to be put into the hands of young students; and, after lucidly summarizing, as he has done, the course of Alexander's conquests, would indicate, with such precision as the subject admits, the general character of their more immediate results.

OFFICIAL HISTORY OF THE ARCTIC EXPEDITION.*

AS a rule, a Blue-book can scarcely be regarded as a literary composition; nor does that which is now before us make any claims to such a rank. It consists of a series of despatches reporting the various incidents of the Arctic Expedition, and it would be perhaps unfair to judge them by literary canons of taste. Otherwise we might have something to say about such a sentence as the following, which, it is only charitable to suppose, may have been mangled in the process of printing:—

Lieut. Beaumont's attempt with a cart, with the same object in view, his able remarks on the difficulties attendant on such a journey over so difficult and mountainous a country, which was then deep with snow, the thermometer being so low, the probable results so small, I consider he showed a wise discretion in returning to the ship the following day.

The ink, one supposes, must have been a little frozen when this odd collection of clauses was put together. If, however, literary form is necessarily absent from such a publication, and if elegance of style is little regarded in particular passages, it must be said, on the other side, that few books of travel are more interesting than this collection of the raw materials from which a book might be formed. When reading what professes to be an artistic narrative of a journey we are often annoyed by the lapse of the author into mere diary. We resent the implied insult when a man, professing to give us a book, gives us only the crude data on which a real book might be founded. In the present case, however, while there is no pretension, we can see that there are some compensating advantages in the less artistic plan. Nothing, as we shall presently see, could impress upon us more forcibly the hardships and labours of an Arctic expedition than a steady reading of the various journals here laid before us. One need have no remorse when skipping

pages in a Blue-book, and there is a certain monotony about much of the present work which will no doubt prompt occasional leaps. But it is worth while to plod steadily through a good many continuous pages in order to receive a full impression of the difficulties encountered and the courage with which they were met.

The despatches here brought together consist of general reports from Sir George Nares and his chief subordinates, followed by the detailed journals of the various expeditions, and illustrated by a great number of charts and panoramic sketches of the scenery. The main outlines of the whole adventure are sufficiently familiar to our readers. After reaching a high latitude in the autumn of 1875, and passing a long winter of extraordinary cold, the main exploring parties were sent out in the spring of 1876. Two of these started from Sir G. Nares's ship, the *Alert*—one of them, under Commander Markham, making due North across the open sea of ice to which Smith's Sound unfortunately leads; whilst the other, under Lieutenant Aldrich, followed the coast-line of “Grant Land” to the West. During the same period Lieutenant Beaumont, of the *Discovery*, followed the Northern coast of Greenland in an easterly direction. Each of these parties made efforts which were pushed to the furthest limits of prudence. They all returned completely crippled by scurvy, and could not have returned at all without the help of the comrades left at the ships. Three lives were sacrificed in the struggle, and the party which aimed at the North Pole made a very insignificant advance towards their goal. They reached a point seventy-three miles due North from the ship, and were still at a distance of 399½ miles from the Pole. In order to obtain complete success, they would have had therefore to travel eleven miles in addition to every two which they actually succeeded in covering. It is to be observed that, in order to advance a mile to the North, they had, on an average, to march nearly four miles. It must therefore be admitted that the expedition was in some sense a failure; or, at least, that the travellers succeeded only in demonstrating that a successful journey to the Pole is out of the question by this route, unless, indeed, some greatly improved method of travelling could be invented.

As there is necessarily a great similarity in the adventures of the various parties, it will be sufficient if we try to give some account of that which made the direct advance to the North. This party, after leaving its supports, consisted of fifteen men, under Commander Markham and Lieutenant Parr, who had to drag three sledges. The weight at starting was very considerable, owing partly to the fact that two boats were taken on the sledges, in case of the ice breaking up before the return of the party to the coast. One of these boats had to be abandoned before they had reached any considerable distance, and the other at about the same point upon the return journey. The gain thus made in weight was unfortunately soon made up by the necessity of placing sick men on the sledges. It was thus necessary that each sledge should be dragged separately by the united crews. They had then to make return journeys in order to bring up the others; and thus, during great part of the journey, five trips of a mile had to be made in order to accomplish an advance of one mile. The nature of the ground (if it is to be so called) was such as to make the progress excessively toilsome. The surfaces of the floes were covered with hummocks of ice, sometimes lying in ranges, and more frequently separated by snow-filled depressions, scored into deep ridges by the wind, and thus resembling a frozen sea. Between the floes, again, were chaotic collections of the debris of pack-ice, frozen together by the winter into “a rugged mass of angular blocks of various heights up to forty or fifty feet.” Through this labyrinth ran the frozen snow-ridges, called “sastrugi,” which sometimes facilitate Arctic travelling by their comparatively smooth tops. As, however, they ran transversely to the direction followed, they formed so many ridges to be crossed at right angles. To force a way through such obstacles with heavily laden sledges, after having to cut a passage with pickaxes, obviously involved terrible labour, even if we leave out of account a temperature of cruel severity. Commander Markham says that, even if no boats were taken and only the most lightly equipped sledges, and if perfect health could be preserved, he does not believe that a party could advance many miles further, certainly not a degree of latitude. He speaks with authority, and, as far as we can judge, with good reason; and it is certainly difficult to say that any advantage would be gained by obtaining a report of a greater extent of similar ice formations.

Commander Markham left the ship on the 3rd of April, and on the 10th separated from the Western party to strike due North across the frozen ocean. The men were in good spirits; the snow-blindness which afflicted their leaders soon passed off; and, except the intense cold, the deep snow, and the generally hopeless nature of the obstacles to be encountered, there was not much to complain of. On the 14th, however, an ominous symptom appeared, though its significance was not understood. One of the men complained of pain in his knees and ankles—a fact not very surprising at the beginning of a period of severe exertion after a winter's compulsory repose. He did not improve, however, and on the 16th had to be carried on a sledge. Frost-bites were common, and we find the entry “Too cold to write.” Still the men were working well, and their commander was only afraid that they would over-exert themselves. On the 17th, however, another man had to be invalided; and on the 19th it was resolved to abandon one of the boats. The loss of two men out of fifteen, and the addition of their weight to the sledges, was sufficiently serious; but others soon began to show symptoms of weakness. Sometimes the invalids could crawl instead of being carried; but more disquieting symptoms gradually

* Journals and Proceedings of the Arctic Expedition, 1873-6. Presented to both Houses by Command of Her Majesty. 1877.

developed themselves. "It is impossible," says Commodore Markham, on the 25th, "to conceive anything more disagreeable than sick men, either in the tent or on the march, especially when they are helpless, persist in groaning all night, and in being querulous and fretful." However, sailors, as he adds, make good nurses, which is some consolation. Still the monotony of travel, when broken only by such incidents as frost-bites and the groans of scorbutic patients, must be wearing to the spirits. Thick weather occasionally made a day's halt necessary; but the rest did little good to the men. On the 1st of May came a bright morning, but we also find the first distinct intimation that the troublesome symptoms were due to scurvy. The travellers resisted the unwelcome belief as long as possible, and if they had recognized the nature of the complaint earlier the knowledge would have done no good. By the 3rd of May we are told that all five patients—that is, a third of the working strength—were "utterly helpless and, therefore, useless." The rest of the crews were "much done up," the extra work caused by the illness of their comrades naturally telling upon them. No improvement took place in the sick, nor in the surrounding circumstances. It was not, however, till the 9th of May that the conclusion was fairly admitted that the illness was really scurvy, and scurvy "in no mild form." A small quantity of the little lime-juice taken was then served out; but there were only two bottles to each sledge. On the 10th, Commander Markham decided that it was useless to persevere further. It was the fortieth day from the ship, and only thirty-one days' provisions were left. Indeed, the only criticism likely to be made upon his decision would be that it might have been reached sooner. A few observations were made on the 11th; and on the 12th the final ceremonies were performed. A bottle of whisky provided by the Dean of Dundee was drunk; the Union Jack was unfurled; songs were sung; a hare, solemnly preserved for the occasion, was eaten; a cigar was issued to each man; and "all," we are assured, "seemed happy, cheerful, and contented." We can only honour their courage.

The retreat resembled the advance, except that the growing weakness of the party intensified the difficulties, and increased the strain upon the spirits and energy of those who were not yet invalidated. Gradually it became evident that the last boat would have to be abandoned, in spite of the risk of the ice breaking up before the shore could be reached. Symptoms of a movement were soon observed, and cracks had opened in the ice. Two more invalids collapsed, however, on the 27th, and the boat, with all stores that could possibly be spared, was finally deserted. "On the 31st," it is said, "we are a perfect band of cripples." It was difficult to find the old route. Snow fell, the wind blew, and the sledges broke through the ice, threatening to immerse the invalids. At last it was determined that Lieutenant Parr should make a forced march to the ship, then nearly forty miles distant, in search of help. He started on the 7th of June, and on the next day one of the invalids died. Service was performed, and Commander Markham hopes that he "may be acquitted of having performed the last rites with indecent haste." We do not think that the charge will be brought very seriously. His duties to the living were, as he truly says, of paramount importance; and poor George Porter sleeps his last sleep under a rude cross made of a boat's oar and a spare sledge baton, as well as if he had the best of marble monuments from a London cemetery. At last, on the 9th of June, the relief party appeared, bringing notice of a larger party following. It was not too soon, for the whole of the explorers were afflicted with scurvy, and some were in a very precarious position. On the 13th they reached the ship supported by their comrades, three of the original fifteen being still able to help in dragging the sledges, whilst the remaining eleven were carried by the relief party.

A similar story is told, as we have already noticed, by the two other exploring parties. They accomplished greater distances, as they kept along the coast instead of having to cross the broken floes. The Western party returned without loss of life; but two men of the Eastern expedition sank under their labours. We need not, however, go into detail as to the various incidents which beset these and various subsidiary parties. The general effect of reading the narratives will naturally be to increase the desire for some satisfactory explanation of the outbreak of scurvy which produced such melancholy effects. We take it to be sufficiently clear that, scurvy or no scurvy, it would have been impossible to advance much further under the given conditions. It therefore cannot be said that the disease materially limited the operations of the party. It is not the less plain that it caused much suffering, and might have given rise to serious disasters if some slight additional misfortune had occurred. Each expedition came, we may almost say, within a hair's breadth of destruction, owing to an evil which had been supposed to be preventable. Without dwelling upon this, we need only say that, from the purely literary point of view, the scurvy was so far advantageous that it makes these matter-of-fact narratives really exciting. All England has lately been in suspense about the fate of the poor Welsh miners, and has rejoiced at their deliverance. If we could have known a year ago what was the condition of the Arctic explorers, we might have been equally moved. It is a curious question whether one would prefer to be immured for many days in the depths of a coal-mine with no light and no food, or to be stowed away in a hole in the snow at a temperature many degrees below zero, with strength decaying under a terrible disease, with a limited stock of provisions, and with the only line of retreat blocked by the difficulties already described, and liable to be made worse at any moment by a change of weather. The courage displayed was undoubtedly admirable,

and, so far as we can judge, the officers in command of the parties seem to have done all that was possible by skill and forethought. On the whole, however, we can fully sympathize with one of their who remarks upon his birthday, passed in one of these performances, that he did not want many returns of that kind of day.

LIFE OF FÉNELON.*

THE accomplished author of the *Life of Bossuet*, reviewed two years ago in our columns, has evidently found a more congenial task in depicting one of the saintliest characters that ever adorned the annals of his own or any other Christian communion. Fénelon, indeed, has never been canonized. The powerful enemies who conspired to impeach his orthodoxy and embitter his life did not scruple to force the hand of Rome in support of their calumnious charges, and they would never have allowed the man they had branded as a heretic while living to receive from his Church the posthumous honours of a saint. But here we may truly say that "the cause is ended," though "Rome has" not "spoken." The instinctive reverence, alike of the Catholic and the Protestant world has recognized in Fénelon one of the rare examples of a perfect purity and nobility of soul which are the common property and common glory of Christendom. Even those who have little appreciation for the graces of an evangelical piety as profound as it was unostentatious are compelled to respect the lofty spirit of unworldliness of a great ecclesiastic, endowed by nature with the richest intellectual and personal gifts, surrounded by the smiles of the French Court in the very heyday of its splendour, and with every prize of ambition open to him which his Church or his country could bestow, but who showed by his course throughout that he cared for none of these things, so long as he could maintain his integrity unstained and fulfil his highest ideal of duty, not only to the friends who adored, but to the Sovereign who persecuted, and the Church which consented to betray him. Nor is his strong common sense, which is not always a characteristic of devout minds, and his statesmanlike capacity—so far as he had opportunity for its exercise—less remarkable than his integrity. No one, so to say, was ever more intensely pious or less of a pietist. When we add that the prelate whose indifference to self seems almost incredible was yet a man of such warm and strong affections as to have inspired alike in his relations, and in the friends who came within the sphere of his magical influence, and above all in his royal pupil, a passionate attachment which years of enforced separation could neither change nor diminish, we have but indicated the salient points of what our readers will perhaps be tempted to dismiss as a beautiful but impossible ideal. Let them read the admirable sketch contained in this volume, and they will acknowledge that the ideal has become a fact.

Born of a noble family, and giving early promise of genius, Fénelon, who had devoted himself from boyhood to the ecclesiastical career, was called at fifteen, like Bossuet, to preach to an admiring audience. His first wish, when a student at St. Sulpice, had been to devote himself to missionary work; but this his uncle, the Bishop of Sarlat, would not allow. He was little over thirty when France was disturbed by its religious troubles, consequent on the revocation of the Edict of Nantes, and the King, by Bossuet's advice, selected Fénelon for a mission to the Huguenots of Poitiers and Saintonge. He would only accept the office on condition that he should be allowed to choose his own colleagues, and that the troops should first be withdrawn from those provinces; the Mahometan method of conversion by the sword was not to his taste. He knew that "in places where the missionaries and the troops work side by side, new converts crowd to receive Communion," but such converts he would not have; they would as soon, under similar pressure, "abjure Christianity and accept the Koran." It is fair to add that the Pope, Innocent XI, had publicly expressed his disapproval of the persecuting policy of Louis in very similar terms. The Secretary of State, De Seignelay, complained of his over-gentleness in dealing with the heretics. Among other things Fénelon insisted on a "profuse" distribution of New Testaments among them, and he had apparently learnt this confidence in Scripture from his old Superior at St. Sulpice; for on his appointment shortly afterwards to the tutorship of the Duke of Burgundy, the son of the Dauphin, Fénelon wrote to him that, "if ever the study and meditation of Holy Scriptures were necessary to you, now indeed they have become overwhelmingly indispensable." At the time of his entering on this important office, at the age of thirty-eight, St. Simon gives the following description of him:—

This prelate was a tall, thin man, well made, pale, with a large nose, eyes whence fire and talent streamed as from a torrent, and a physiognomy the like of which I have never seen in any other man, and which, once seen, one could never forget. It combined everything, and the greatest contradictions produced no want of harmony. It united seriousness and gaiety, gravity and courtesy, the man of learning, the Bishop and the *grand seigneur*; the prevailing characteristics, as in everything about him, being refinement, intellect, gracefulness, modesty, and, above all, *noblesse*. It was difficult to take one's eyes off him. All his portraits are speaking, and yet none of them have caught the exquisite harmony which struck one in the original, or the exceeding delicacy of every feature. His manners altogether corresponded to his appearance, his perfect ease was infectious to others, and his conversation was stamped with the grace and good taste which are only acquired by habitual intercourse with the best society and the great world. He possessed a natural eloquence, graceful and finished, and a most insinuating

* Fénelon, Archbishop of Cambrai. A Biographical Sketch. By the Author of "Life of Bossuet," &c. &c. Livingston. 1876.

yet noble and appropriate courtesy; an easy, clear, agreeable utterance; a wonderful power of explaining the hardest matters in a lucid, distinct manner. Add to all this that he was a man who never sought to seem cleverer than those with whom he conversed, who brought himself insensibly to their level, putting them at their ease, and entraining them so that one could neither leave him, nor mistrust him, nor help seeking him again. It was this rare gift which he possessed to the utmost degree which bound all his friends so closely to him all his life, in spite of his disgraces at Court, and which led them, when scattered, to gather together to talk of him, regret him, long after him, cling more and more to him, like the Jews to Jerusalem, and sigh and hope for his return, even as that unhappy race waits and sighs after their Messiah.

Of his pupil, then a child of seven, the same writer says:—

He was so passionate that he would break the clocks when they struck the hour, which summoned him to some unwelcome duty, and fly into the wildest rage with the rain which hindered some pleasure. Resistance made him perfectly furious. I have often been a witness to this in his early childhood. Moreover, a strong inclination attracted him to whatever was forbidden to body or mind. His satirical power was all the more biting that it was clever and pungent, and he seized promptly on the ridiculous side of things. All this was sharpened by an elasticity, mental and bodily, which became impetuosity, and which made it impossible for him in early days to learn anything without doing two things at once. He gave himself up to all that pleased him with violent passion, and with an amount of pride and *hauteur* past description; he was dangerously quick in penetrating both things and people; in seeing the weak side, and in reasoning more powerfully and deeply than his masters. But, on the other hand, as soon as the storm of passion was over, reason would return and get the upper hand; he would see his faults and acknowledge them, sometimes so regretfully as almost to renew the storm. His mind was lively, quick, penetrating, resolute to meet difficulties; literally speaking, transcendent in every way. The marvel is that in so short a time devotion and grace should have made an altogether new being of him, and changed so many redoubtable faults into the entirely opposite virtues.

But Fénelon, who, like many of his order, though childless himself, was exceedingly fond of children, proved quite equal to the occasion. He had already expounded, in a treatise on education, his notion of the right method of dealing with them:—"Never, without the most urgent necessity, be stern or dictatorial . . . or you will close their hearts against you, and destroy conscience, without which there is no hope of educating them rightly. Make them love you, accustom them to be open with you, and not to be afraid of letting you see their faults; and to this end be indulgent to such as they do not try to conceal." He had at first no easy task with his youthful charge, towards whom he could be stern as well as indulgent, when he saw need for it, but he succeeded in so completely winning his affections that on the morning after the most violent outbreak of temper on the one side and the severest rebuke on the other, the boy exclaimed with sobs and tears:—

"Oh, Monsieur, I am so sorry for what I said yesterday! . . . If you tell the King, he will not care for me any more, . . . and what will people think if you leave me! I promise, oh, I promise ever so much, that you shall not have to complain of me, if only you will promise not to go!"

At another time, after a fit of passion, he would say, "Now I shall leave the Duke of Burgundy behind the door, and be only little Louis with you." But we cannot linger on the details of this interesting and peaceful period of Fénelon's life, which our readers must be left to study in the biography for themselves.

Fénelon had at first been on intimate terms with Mme. de Maintenon, who constantly sought his spiritual direction; but in the controversy about Quietism, which changed the whole current of his life, she turned against him, and carried the King with her. Into the theological merits of the question, and the disputed orthodoxy of Mme. Guyon, we cannot enter here. Suffice it to say that the leaders of the two great schools of mysticism which have appeared in the Roman Catholic Church in Germany in the fourteenth century and in Spain in the sixteenth, were suspected or persecuted in life, but honoured after their death. Tauler and Henry Suso, who have since been beatified, were accused of heresy, and have been claimed, not very reasonably, by Protestants as pioneers of the Reformation; Eckhart may fairly be said to have sown the seeds of that pantheism which reached its efflorescence in the wild rhapsodies of Jacob Bohme. In Spain, Louis of Leon and St. John of the Cross were imprisoned, and St. Theresa, who was deluged to the Inquisition, narrowly escaped the same fate; yet all are now held in reverence in their Church, and the two latter are canonized saints. Mme. Guyon, however, differed materially from all of these. Whatever may be thought of her orthodoxy—of her sincere piety there can be no doubt—she certainly had much of the visionary about her, and was deficient in judgment and good sense. St. Theresa's active life and strong masculine features, as represented in all authentic portraits of her, have little in common with the character and career of the accomplished lady who was so unfortunate as to rouse the angry suspicion of Bossuet, and was sacrificed to the stupid bigotry of Louis XIV. But Fénelon, though he liked and admired her personally, was not responsible for her opinions, and had all along emphatically disclaimed any sympathy with Quietism in the sense in which his Church condemns it; and his familiarity with mystic theology, as Mr. Jervis has observed, eminently qualified him to discriminate between what was sound and unsound in her writings. There can indeed be no doubt that Mme. Guyon herself, whose faults at worst sprang from a mistaken enthusiasm, was harshly and cruelly treated, and the injustice shown towards her is aggravated by the notorious profligacy of her chief persecutor, Mgr. de Harlay, Archbishop of Paris, of whom Sainte-Beuve observes, that "of belief properly so called he had nothing," while "the more closely his life is looked into the greater appears to be the number of his mistresses," in the arms of one of whom he died. But it was not unnatural that theologians should distrust her competence as a religious guide.

Of the strict orthodoxy of Fénelon himself, and of the work on which the articles of impeachment were based, the *Maximas des Saints*, none but his personal enemies, among whom it is humiliating to find Bossuet taking the lead, ever affected to doubt. Cardinal de Noailles, who was afterwards pressed into their service, declared at first to Mme. de Maintenon that there was not "a single proposition, or expression, or even a single word, he could find fault with" in the book, and that the author could not be condemned without condemning St. Francis of Sales also. Fénelon himself told the Duke of Beauvilliers that he had not found a single theologian at Paris who, after quiet discussion with him, did not assent to all his opinions. Least of all did the Pope, Innocent XII., doubt him, who stated at the outset to his representative at Rome his "entire conviction that M. de Cambrai is beyond all possible suspicion." But there was a lay Pope in the background who pulled the wires. Innocent yielded to the imperious dictation of Louis XIV., and Louis was ruled by Mme. de Maintenon, whose mind had been poisoned against Fénelon by Bossuet and his allies. He was advised by friendly Cardinals "to make peace at home, and not let the matter be pressed at Rome"; nor can there be any doubt, as our author remarks, that if he had chosen to flatter Mme. de Maintenon and comply with her wishes, he would have retained his position at Court and his orthodox reputation; but this was not a course he could consistently follow. From first to last he was the victim of an ignoble and scandalous intrigue which has permanently tarnished the good name of all concerned, though it has but served to add fresh lustre to his own.

The most discreditably part in the drama was enacted by Bossuet, the most humiliating by the Pope. The question at issue, it must be remembered, was one of speculative theology pure and simple. If there was ever a question which on Ultramontane principles must fall directly and exclusively within the sphere of Papal infallibility, a question over which, on any theory short of the extremest Erastianism, lay tribunals can claim no jurisdiction, it was this. Yet it was virtually decided by the King of France over the head of the Pope, who was dragooned into giving formal effect *ex cathedra* to a dogmatic judgment against which he long vainly struggled, and which he had repeatedly declared to be unjust. "*Meldensis episcopus est Papa Gallus*," said a Roman Cardinal; "*sed vult confirmare suas decisiones brachio seculari, brachio regis*." And by "the secular arm" the controversy was in fact decided. Another Cardinal observed, in reference to the female keeper of the King's conscience, "Nou est ira super iram mulieris." After an examination protracted through sixty-four sittings, the book would have been acquitted; but the Pope, acting under pressure from the French Court, and in defiance of all precedent, submitted it afresh to the judgment of the Cardinals. Still it would have escaped censure but that both Pope and Cardinals were terrified by the threatening letters constantly received from France. "It will not do," they said, "to fire great guns at a King"; and the gentle and submissive Fénelon himself could not refrain from writing to his emissary at Rome that "a censure or prohibition will hardly damage the Holy See with Europe generally less than it will me." At length the condemnatory Brief was issued—the Pope succeeded in substituting a Brief for the more solemn sentence of a Bull, but was overruled in a final attempt to keep Fénelon's name out of the document—which formally condemned as "rash, scandalous, ill-sounding, offensive to pious ears, pernicious in practice, and respectively erroneous," twenty-three errors in a book which, according to his Holiness's own deliberate judgment, contained none. The triumph of the victorious party, headed, one is ashamed to think, by Bossuet, was not less indecent than the means by which it had been procured. But that did not prevent Fénelon from submitting at once, as it was known that he would do, and himself publishing the condemnation of his book, which he forbade the faithful of his diocese to read; but, conscious of his own orthodoxy, he "steadily refused to utter one syllable which could be perverted into a semblance of retraction."

He lived for sixteen years after this, honoured and loved by all whose regard was worth having; but he never returned to the Court from which the King had banished him, nor did either Innocent XII. or his successor Clement XI. venture to show him any public favour, though the latter wept on hearing of his death, as well for the Church's loss as for his own weak subserviency to Louis XIV. in not having carried out his wish to make the Archbishop of Cambrai a Cardinal. But the loss of worldly honour and position was no privation to Fénelon. If he regretted his enforced absence from Paris, it was only because it debared him from the society of friends very dear to him, and above all from intercourse with his former pupil, whom he loved as a son, and who to the last—for he died before Fénelon—warmly repaid his affection. Very touching is the account of their correspondence and of their few brief and hurried interviews grudgingly and ungraciously conceded by the aged King to the importunities of his grandson. The sketch of the Archbishop's domestic life and habits at Cambrai, given in the last two chapters of the biography, and copiously illustrated from his letters, is full of interest. Many of the leading personages of the day were among his correspondents both within and beyond the limits of his own country, as was natural, for he was himself the author of many learned works. But more is to be learnt of the true mind and character of the man from those private and family letters of which his biographer has known so well how to make a judicious use:—

They bring Fénelon so vividly before one; living his quiet yet active life at Cambrai; surrounded by guests and duties, amid which he finds

time to think for every one, from the "little page" Alexis, and his education, upwards; caring so heartily for country, diocese, cathedral, town, relations, friends; dwelling upon the accidents of his niece's long illness, and the details of his nephew's damaged leg, as though he had no weightier cares to occupy his mind, and turning everything to gold by his instinctive and natural reference to the Love of God. I am the more disposed to do this, as an idea seems to have grown up among some who have spoken or written of Fénelon, that during his latter years he dropped into "a state of passive Quietism," whereas really we need only the testimony of his own life and letters to see how very beautiful and zealously active his last days were. If ever any man on the downward course of life threw himself out of himself into the interests of others, their joys and sorrows, or made the deep, fervid love of God, which was as the very air he breathed, take living shape in act and deed, it was surely Fénelon.

The great trial of his declining years was the early death of his beloved pupil, the Duke of Burgundy, but it did not dry up the spring of his affections. He retained to the end that peculiar sympathy for children and power of attracting and influencing them which we already have dwelt upon. Thus we find him in the last year of his life writing to remind the Duke of Chaulnes of his promise to send him "the dear little ones, when the warm weather comes, about Whitsuntide." They came, and he writes to their father, drawing out the different characters of the three boys with his accustomed tact and sound sense, and finding many points to commend in each of them. "I am delighted to have the little troop with me; they cheer me up, and are not the least in my way." His last letter, dated just a week before his death, is addressed to his favourite nephew, the Marquis, and full of his usual tender playfulness, ending with "O quo je t'embarrasserai, mon petit Fanfan!" His illness only lasted a week, but the "petit Fanfan" and his other favourite nephew, the Abbé de Beaumont, arrived two days before the end, to his great joy, and other relatives and intimate friends knelt round his dying bed. In the early morning of January 7, 1715, he passed away peacefully, at the age of sixty-five. The King, who did not survive him many months, remarked bitterly on hearing of his death, "Il nous manque bien au besoin." It is noteworthy that the Chapter of his cathedral was afraid of offending Louis by having the usual funeral oration pronounced over him; while in the French Academy, of which he had been a member, no one for the same reason dared to mention his *Télémaque*, though it was then regarded as the *chef-d'œuvre* of modern literature. In 1793 the Cathedral of Cambrai was destroyed by the Revolutionary mob and Fénelon's tomb torn up; but the body somehow escaped their fury, and is now replaced in the new cathedral, a poor edifice, of 1825. But his noblest monument, as his biographer observes, is the veneration and affection felt for his memory throughout Christendom. He had his errors no doubt, and we may perhaps be permitted to regret the strong line he took against the Jansenists, as such—though to individual members of the party he was ever gentle and forbearing—and his decided attachment to the policy of the Jesuits, which even brought him into confidential relations with the odious Le Tellier. But these at most were errors of judgment; they cannot dim the brightness of that single-minded fidelity to his highest conception of duty in every relation of life, secular or sacred, in which posterity has recognized a claim that is almost unique to the blessing pronounced of old on the pure in heart.

AMSTERDAM AND VENICE.

M. HAVARD'S characteristics as a writer must be already known to many readers in England, where his works are beginning to be translated, and have already had some sale in the original French. His speciality appears to be that of observing foreign countries and describing them for the benefit of French people, who are generally much in need of information on such subjects, and at the same time creditably grateful for it when the writer is not tedious or didactic. M. Havard is an unusually favourable specimen of the Frenchman who has lived abroad. He interests himself in all he sees, and is quite ready to recognize good qualities in other places than Paris; besides which he has a kindly good humour, both with regard to the subjects of his discourse and the public to whom it is addressed. He sees most things that an intelligent man would be likely to see in a strange place; he has read a good deal, he takes a healthy general interest in mankind and their doings, in manners and customs, in the products of all the industries and arts. The prosperity of other countries gives him pleasure, for he likes to see labour and intelligence rewarded even out of France; and their decadence awakens in him feelings of sympathy quite unknown to the ill-natured spirit which so often calls itself patriotism. M. Havard has lived both in Amsterdam and in Venice, and he has evidently a strong affection for both places, feeling the charm of each, the peculiar local charm which he endeavours to explain and communicate to us. Every city has its own character, and there are very few cities of any historical importance in the world which have not a peculiar attraction for those who know them well. Even London, in spite of its vastness, and the rarity of beauty in its buildings, has a magical charm for many people. The attractiveness of Paris is more generally recognized, and Venice has acquired a poetical reputation due to writers and artists who have used it so much that we should have thought they had almost used it up. The poetry of Amsterdam is less known, and we are much indebted to M. Havard for making us rather more alive to it. We English mostly believe in Venice with perfect faith until we have gone

there, and cling to our old illusions as much as possible after seeing it. The Venice of our imagination is the Byronic, which impressed us so vividly when we were boys, and at a later period we may have derived from Mr. Ruskin an exaggerated estimate of the merits of Venetian architecture; but we have never had any enthusiasm about Amsterdam. What can we see there which is not to be seen in Liverpool? Quaint gables probably, and Rembrandt's house, and Dutch merchants, and canals, and much creditable house-painting and scrubbing and cleanliness; but surely there cannot be any poetry in Amsterdam, surely there cannot be much to delight the eye or awaken the imagination. M. Havard thinks differently. In his opinion Amsterdam is quite comparable to Venice, but in a different style and character. There is not much of what we call architecture at Amsterdam; there are no palaces except the heavy, though imposing, structure called the Dam, and the ecclesiastical edifices are insignificant in comparison with St. Mark's; still, if there is little architecture, there is a great deal of picturesque building, much colour, fine reflections in water, and there is also an atmosphere which, if not so light as that of Venice, is of the finest possible pictorial quality. M. Havard protests against the common idea that the atmosphere of Holland is sunless and foggy. M. Vitet speaks of it as being "sombre et brumeux, sans transparence ni couleur." M. Taine talks about the "ciel charbonneux d'Amsterdam," and M. Charles Blanc of the "ciel voilé" of the Netherlands. Even Londoners, it appears, write about "the fogs of the Hague"—a criticism which, M. Havard seems to think, comes ungracefully from the banks of the Thames. The result of his own observation appears to be very different from the opinions we have just quoted:—

Il faut pourtant une bonne fois faire justice de cet étrange préjugé. Non, la Hollande n'est point un pays brumeux, charbonneux, sombre, sans transparence ni couleur; c'est au contraire un des pays les plus colorés et les plus lumineux qui existent. Son ciel, chargé de vapeurs, réfléchit la lumière avec une intensité excessive. Les nuages qui sillonnent presque constamment le ciel, projettent sur la campagne leurs ombres lourdes, mais transparentes, et divisent ainsi la plaine infinie en grands plans tour à tour sombres ou fortement éclairés. Or, comme les couleurs ne valent que par le contraste, ces vastes bandes brunes qui rayent le paysage redoublent la coloration des parties en lumière, et la plaine qui s'étend à perte de vue devient, par cette succession de parties claires et obscures, la campagne la plus colorée peut-être qui soit en Europe.

M. Havard likes the country about Amsterdam quite as much as the town itself, and here again he differs greatly from a very common opinion on the subject. Many people think that Holland must be uninteresting because it is flat, and because there is a great deal of what is evidently artificial; but the few foreigners who thoroughly appreciate Holland always affirm that it is one of the most interesting countries in the world, and one of the best for artistic purposes. The truth is that flat countries have their poetry as well as hilly countries, but it is of a different kind.

We are all much more familiar with the industry of the Dutch than with the beauty of their country; we know that they protect fields from the sea by dykes, and build as the Venetians did, on piles. The work of driving these piles before the application of steam power must have been excessive. The Dam stands upon 13,700 piles, which were once a forest of big trees somewhere in Sweden or Norway, whilst the big stones about the foundation of the palace were brought from a distance also. There is a picture which represents the Dam in the Louvre, and M. Havard tells a good story of its acquisition. After the painter's death, this picture was left along with the rest of his personal estate, and so came into the hands of one of his relations who, being a rich man, had no desire to part with it. In the time of Louis XVI. M. Randon de Boisset tried to obtain the picture for the French royal collection, but could not overcome the tenacity of the proprietor. M. Paillet afterwards went into Holland to buy some pictures for the King, and had recourse to an ingenious snare to get possession of this one. The owner went frequently on 'Change, so one day he was accosted there by an agent who told him that a foreigner had come to get the picture, and that the best way to get rid of him would be to ask a price so high that nobody would think of giving it. The owner thought this a good plan, and said the price was 6,000 florins. On this the broker put a piece of gold into his hand and said, "The picture is mine, the rest of the price will be duly paid." Engagements made on 'Change being irrevocable, the owner of the work had no resource but to give it up, and that is how the picture got into the Louvre.

The Dam became a royal palace in the time of Louis Bonaparte, who first began to form here, and at his palace near the Hague, that collection of Dutch pictures which is now one of the chief attractions of Amsterdam. It has an additional historical interest as the place where Louis Bonaparte abdicated the throne of Holland, and since the year 1813 no foreign regiment has ever been quartered in its precincts. The Dam appears to have been well adapted for the reception of royalty, although built originally simply as a town hall. The interior is exceptionally rich in marble, for the walls are covered with it from top to bottom, and M. Havard tells us that it was all brought from Italy. The biggest room in the building is the Hall of the Burgheers, which is shorter than our London Guildhall, but wider, and very much higher, being a hundred feet, whereas our Guildhall is only fifty-five. This enormous room is entirely lined with white marble, which of course only increases the effect of size. There is a belvedere on the top of the edifice, from which all Amsterdam and its environs can be seen easily, including Zaandam, where M. Havard tells us that ten thousand windmills may be counted, and the great North-Holland Canal shines on the plain in a long, straight, silvery streak.

* *Amsterdam et Venise.* Par Henri Havard. Paris: Plon. 1876.

M. Havard mentions a curious fact in connexion with the limited degree of religious toleration formerly extended towards Roman Catholics in Holland. They were allowed to have churches or chapels; but only on condition that there was nothing visible outside which might indicate the religious use of the building, coupled with another stipulation that Protestant ears should not be offended more than Protestant eyes. The consequence is that to this day many Roman Catholic churches in Amsterdam have the outward appearance of ordinary dwelling-houses in a street, whilst they bear names very like inn signs, such as the Perroekste, the Star, the Post-horn, &c. While on this subject M. Havard also tells that a sect of Protestants in Holland, who are descended from the French refugees of the sixteenth and seventeenth centuries, retain the use of the French language in their religious services in memory of the land from which they originally came, and that the language is kept pure by the practice of sending for pastors from France and Switzerland. M. Havard makes the curious remark that there is hardly a considerable newspaper in Holland which does not count an ex-Protestant clergyman and a Jew amongst its principal contributors. In French there is a distinction between Israelite and Jew. When you want to speak politely of a Jew you call him an Israelite. M. Havard found the same distinction in Holland, and says that somebody once asked a great banker what was the difference between Israelite and Jew. The answer is worth quoting. "Under 1,200*l.* a year one is a Jew; above it, one is an Israelite." The explanation given in this volume is that, unless a Jew is very well off, he is apt to look repulsively dirty and uncivilized; whereas the wealthy members of that community are clean and polite, and look as if they belonged to a different race of men. Amongst the special industries of Amsterdam, M. Havard mentions diamond-cutting, which is carried to great perfection here, and almost entirely by Jews, who have large mills with long chimneys where they do the work. The trade is so difficult, and requires so much natural aptitude and acquired skill, that the workman earns very good wages. In 1873 the common wage was twenty-eight shillings a day, supposing the workman to work six days in the week, but first-rate hands earned twice as much. This, probably the most highly paid manual labour in the world, if we consider it simply as manual labour, but M. Havard speaks of it as requiring a good deal of intelligence also. There are great associations connected with the Jews' quarter at Amsterdam. Rembrandt's house is there. Here he lived after his marriage with his wife Saskia, and did not leave the house for twenty years, when his creditors sold his furniture and collection, and he had lost not only his money, but also his wife and son. All this, however, is very well known to those who care about Rembrandt, and even the appearance of the house is familiar to them from the etching by Flaming in Charles Blanc's *Œuvre de Rembrandt*. What will be new to our readers is the discovery connected with Spinoza's birthplace and place of residence. Even when M. Havard's book was sent to press this was still unknown; but before p. 208 was printed he had time to insert a note, which we give in the original:—

Depuis que ces lignes sont écrites, M. Scheltema a découvert le lieu de naissance de Benedictus de Spinoza. "C'est sur le Houtgracht, l'ancien éminent archiviste d'Amsterdam, dans la maison portant la lettre Q et le n° 205 qu'est né Spinoza. Cette maison, habitée par J. N. Herget, est aujourd'hui occupée par un magasin de porcelaines.

We should be glad to know the reasons which led Mr. Scheltema to this conclusion. M. Havard makes the rather ingenious remark that, when Spinoza was forced by the intolerance of the Jews at Amsterdam to go and seek a refuge at the Hague, he who had wished to give his contemporaries greater mental clearness of sight was compelled by Fate in her irony to make spectacle-glasses for a living.

Like all visitors to Amsterdam, M. Havard complains of the condition of the Amsterdam public gallery, which is a disgrace to the Dutch people. It is so arranged that the pictures cannot be properly seen, and an oil merchant has his warehouse hard by, so the collection is at the mercy of a careless apprentice and a high wind:—

De l'écrivain qui renferme toutes ces merveilles, je n'ai pas grand'chose à vous dire. C'était jadis "la belle maison du marchand Trip." Aujourd'hui c'est le plus détestable musée qui soit au monde. Les chefs d'œuvre y sont à peine visibles, tant ils sont mal éclairés. Les jours froids dénaturent leur couleur et l'assombrissent, pendant que les poëles en hiver et la poussière en été couvrent ces merveilles artistiques d'une crasse épaisse, qui en aura bien vite raison. La princesse d'Orange logea en 1738 chez le marchand Elie Trip et personne n'estimerait qu'elle dut se trouver mal à l'aise, car la maison est vaste, belle, et commode. Mais les appartements princiers ne conviennent guère aux œuvres de grands peintres. Il leur en faut d'agencées spécialement pour eux; et c'est de quoi la municipalité d'Amsterdam ne s'est point encore mise en peine. Elle a construit à grands frais un palais pour l'industrie; le commerce doit être content. On a élevé des marchés pour le poisson, une bourse pour le grain; l'estomac doit être satisfait. Il n'est pas de culte qui n'ait ses temples, même celui de Plutus, car on a reconstruit la bourse. Il serait maintenant grand temps de s'occuper de l'art, qui est un des plus beaux fleurons de la couronne Amsterdamoise.

M. Havard does not mention recent efforts to amend this disgraceful state of things, a full account of which has been lately given in *Art*. A commission was formed in 1863 to build a museum by national subscription, but it failed through the public apathy. In 1873 Mr. Van Houten, a deputy, prevailed upon his colleagues and the Government so far that the action of the State in the matter was decided upon. The Government gives 1,000,000 *fl.*, the town of Amsterdam a good site and 100,000 *fl.* The work is already begun, and the first stone will probably be laid next April. The plan of the museum is excellent. There will be two glass-covered

courts with large casts in them, and the ground-floor will be generally given up to sculpture, prints, and the library, the first floor, of ample dimensions, being used entirely for pictures. The building will be fireproof.

If the good people of Amsterdam have hitherto shown themselves rather cool about the old Dutch masters, as if they did not much care whether their pictures were preserved and visible or not, they are more enthusiastic about music, especially the Jewish part of the population. M. Havard quite corroborates our previous belief that the Dutch are a cultivated people in some directions. Dutch ladies, he says, have generally read a good deal in different languages, and about subjects worth studying; they can talk very well, too, when they like; but as a general rule there is very little conversation, merely because the art of conversation is not cared for or cultivated. M. Havard very judiciously observes that this art or talent does not always need much learning or flourish best amongst the learned, and he instances the poverty of conversation amongst the most learned Germans. We are sorry to hear that Dutchmen are generally rather severely governed by their wives; but this is probably because the ladies are such good housekeepers that they acquire general habits of energy and authority. This development of feminine character may sometimes, it is whispered, be observed even in England, and it is just possible that some of our readers may have remarked it. In many respects the Dutch bear a much nearer resemblance to the English than to the French; indeed some of our customs, such as the liberty of our young ladies, are carried further in Holland than they are here.

We must not close the book before us without a word of praise for M. Flaming's four etchings of Amsterdam, which are all good, and are no doubt the recreations of a hand usually employed on far more difficult themes. About sixty of the woodcuts in the volume are also devoted to Amsterdam, and, although these are of very unequal merit, many of them are useful in helping us to a more accurate knowledge of the place and its inhabitants. Venice is equally well illustrated, but we reserve Venice for another time.

CONDONED.*

MRS. STEELE'S novel is one of the many examples of the evil caused by the tyranny of the three-volume system. It is a production which would be very much the better for compression. There are many sketches of character in it which are touched with a light hand and not without humour; and the personages imagined by the author might have been conducted through one or even two volumes so as to keep a reader's attention without much sense of fatigue. The inevitable third volume is, however, too heavy a weight for them to support. It is possible that the writer's views as to what portion, if any, of her story it would be desirable to suppress might be different from ours; at least one gets the impression that a somewhat heavy and feeble attempt at political satire which occupies some twenty pages of the third volume was intended to be one of the most telling parts of the book. And if there is any truth in Thackeray's saying that all people engaged in producing works of art would rather be cried at than laughed at, the writer of *Condoned* would be less inclined to sacrifice the scenes which are meant to be tragic than those to which the book really owes its merit. There are, however, certain themes which should never be taken but by a very strong writer. The incident of a woman who, although really married, is not supposed to be so, and who has been deserted by a scoundrelly husband, rushing wildly across the fields with a newly-born infant, is one which certain novelists of the worst modern school would relate as readily and confidently as Mr. Black would describe a Scotch scene. But the writer of *Condoned* is almost as far above novelists of this class as she is below the writers who are equal to the task of fitly describing tragic events; and she will be wise in future to be content with trying to do better what she can already do with some success, instead of aiming at what is obviously beyond her powers. In other respects Mrs. Steele has some things to learn before she can write a novel which shall be satisfactory without being too ambitious. The story of *Condoned*—a title for which, by the way, there is no adequate explanation—although there is nothing very new in it, is by no means ill conceived. But it is wanting in that concentration of interest which is a great part of the art of story-telling, and one of the chief characters is strangely unreal. In Lucius Fairfax, the man who basely deserts his privately married wife to make a rich match, the writer has tried to draw the character of a man who, with utter selfishness and meanness combines not only some qualities which are attractive on the surface, but others which are good in themselves. One such character has been drawn with marvellous success by the same hand that has been strong enough to deal with the description of a heart-broken mother, which Mrs. Steele has unwisely attempted; but it can hardly be discouraging to Mrs. Steele to be told that there seems no great probability of her ever being able to create such a personage as Tito.

The story of *Condoned* opens with the entrance of a wandering gipsy child into Heronmere, the house of Lord Vipont, in Siltshire. The owner of the house is thus described by the writer:—

He was a man somewhat past middle age, with a face older than his years; slender, fair, and high bred, he looked like a tall, white, withered lily; his hands, colourless and delicate, moved with a listless grace, sug-

* *Condoned*. By Anna C. Steele, Author of "Broken Toys," &c. 8 vols. London: Chapman & Hall. 1877.

gestive of dalliance rather than strife; his small blue eyes had that soft and sweet, sidelong, sympathizing glance, which is compatible with perfect selfishness. Not that he was perfectly selfish—few of us are perfect even in our vices: he had a man of the world's conscience, and that is much—for to desire not to be found out is a tribute to social convenience if not to virtue. Lord Vipont's life had been an immoral life, but his immoralities resulted less from an over than an under excess of emotion. There are natures that are rich in the generosity of their faults—that, betrayed by self-indulgence, are sympathetically indulgent to the faults of others: but the middle tone of Lord Vipont's mind had no poignant note in it; he could apologize for a sin to any one to whom he thought such apology was due, whether God or man; but the deep pertinacious knell of remorse, or the plaintive echo of compassion, were not in his spiritual diapason. Not that he was incapable of kindness to another, provided that it did not entail a sacrifice of self; he did not like to inflict or witness pain.

While he is at dinner, a wild, dishevelled little girl appears at the window, is let in, ravenously devours the food given to her, and curls herself up to sleep on the rug. While she sleeps, Lord Vipont looks at some coins strung round her neck, and it is perhaps needless to say that, on seeing the inscription on one of them, "he dropped them as if they burned his hand." Having made the discovery indicated by the effect of the coin on his hand, he prudently sends the wait, for whom, by the aid of his librarian, he finds the name of Astaroth, into the care of a poor cousin of his, a clergyman named Desmond, who is induced, for the sake of two hundred a year, to add the charge of her to that of his own numerous brood. Near Mr. Desmond live two old maids named Dalrymple, who, soon after Astaroth joins the Desmond family, are afflicted by the arrival of a noisy nephew, son of a dead never-do-well brother in the navy, who married an actress. Here is a letter addressed by this boy to his mother, then acting in the provinces, a little time after his invasion of the Misses Dalrymple:—

DEAREST MAMMY,

The two old girls seem no end fond of me. I think they'll do, tho' it's rather hard lines not having Nettie in the house; but I get over that as well as I can by smuggling him in at night, when they're all in bed and think I am too. I'm to be a sailor, and a first-lieutenant directly, and then I'll send you all my prize money. Meanwhile, please send me ten shillings directly. My aunts would make first-rate "walking cecotines," and I know they're "good studies" by the number of hymns they repeat in the evening. At first I cheered them, as you told me all women like encores; but they wouldn't come on again. I hope you have good houses; there's no theatre here, but there's a church.

Your affectionate son,

HUGH DALRYMPLE.

Astaroth and Hugh become great friends; and the Lucius Fairfax spoken of above arrives as a pupil at Mr. Desmond's house and creates a certain amount of awe among the children by his superior age, wealth, and knowledge of the world. Hugh Dalrymple is on his way to sea when, by dint of insisting on driving himself the carriage which takes him away from his aunts, he upsets it, and is brought back to them in a helpless condition. His mother is sent for, and her arrival gives rise to some of the most amusing scenes in the book. There is, it is true, an element of caricature in the representation of the revolution effected by her coming in the ways of the Dalrymple household; but it is, we think on the whole, no more than is allowable; and we only regret that the writer did not keep to this line, in which she can certainly do well, rather than wander into regions where she loses herself. There is one point in which a reader disposed to find fault might well say that the license of caricature had been abused, and that is the effect produced upon Hugh's aunts by the revelation to them of "laced" tea on the part of Hugh's mother. Besides the blunder made in the disproportion of cause to effect, there is a graver reason for objection to this. Mrs. Steele has desired to show, what one could wish was more readily acknowledged, that an actress who has been prevented by force of circumstances from ever rising to anything higher than playing burlesque parts may yet possess every domestic virtue. But she has needlessly exaggerated the Bohemian element which is no doubt inevitable to a certain extent in a woman who has led the difficult life of Mrs. Dalrymple, and she has probably produced upon some readers by this oversight an effect opposite to that intended. Against this fault must be set the good sense and truth of the long answer given by Mrs. Dalrymple to one of her sisters-in-law, who asks, under the influence of "laced" tea, if "some actresses are not just a *little* wicked." It may be observed that Mrs. Dalrymple was, we fear, unusually fortunate in finding an elderly philanthropist of the Cheeryble type to look after when she was driven by necessity to contemplating the abandonment of self-respect as a thing possibly desirable; but in speaking of this part of Mrs. Dalrymple's experiences it is only fair to give credit to the writer of *Condensed* for having treated a dangerous subject with a freedom from offence which is by no means too common in novels of these days. This quality goes far to redeem the defects of literary taste shown in other parts of the book, and induces us to hope that Mrs. Steele may one day produce a book which may possess the merits of her present performance, without the faults which possibly come from the belief that a certain power of imagination and expression is enough to carry its possessor easily through the most difficult tasks.

Hugh does finally go out to sea, returns, goes out again on the expedition which gives the writer occasion for her not very happy satirical writing, and yet again returns and makes love to Astaroth, from whom he obtains an unwilling promise of fidelity. The reason for Lucius Fairfax's existence is that he should induce her to break this promise and to marry him secretly. As to the part which he plays in preventing the possibly terrible consequences of

a rising of Lord Vipont's labourers, egged on by an interested democrat, that is absolutely inconsistent with his nature as elsewhere depicted. The man who could behave as he did to Astaroth, according to Mrs. Steele's representations, is the last man who could influence an excited mob by force of personal sympathy. There have been men who have combined an odious brutality in private life with a popular influence that few people could resist. But Lucius in no way resembled a man of this kind; his strength, such as it was, lay in his pliability and weakness. Mrs. Steele's hero—for that in a sense he is—is a mere puppet, whose movements could be caused by nothing but the arrangement of strings disposed by one ignorant of the laws which govern human minds.

We have given closer attention to *Condensed* than, from our enumeration of its faults rather than its merits, it might seem to deserve. But we have done this because it has certain qualities which lead us to think that its author, if she can avoid the temptation of small and temporary popularity, may do something which shall be good without aiming at greatness.

ANCIENT STREETS AND HOMESTEADS OF ENGLAND.*
